Manure yields carbonic acid which is the most effective agent in the soil for carrying phosphoric acid to crops. Hence it is important to provide a liberal supply of farm manure or other vegetable matter where rock-phosphate is to be used. The two may be applied in mixtures and when fermentation takes place in the warm months, the process should be hastened by thorough tillage which admits air to the fermenting material and increases the action of bacteria. Under these conditions a part of the phosphoric acid will be made soluble by carbonated water and will be used immediately if there is a crop on the land. Otherwise it is quite sure to be either lost by leaching from the soil or it will be made insoluble again.

The action of the bacteria in thus holding the phosphoric acid is of course valuable, but it possesses no economy when taking place in a manure pile before the phosphate has even reached the soil. Hence farmers are advised to apply rock-phosphate and manure to the land as soon as they are mixed; or separately and turn under at once. When applied in winter, the fertilizer should be turned under in early spring. In this way, where a crop is grown and thoroughly tilled, the rock-phosphate is sure to give valuable returns.

Turnips for Sheep.

T. R. Arkell, of the New Hampshire Experiment Station, finds that turnips in the winter ration materially reduce the cost of mutton production as compared with rations commonly used. He states that the chief danger in the use of turnips lies in heavily overfeeding or attempting to make them constitute the bulk of the ration, in which case they are liable to make the ration too laxitive and produce scouring. On the other hand, owing to their watery nature, turnips render the ration more palatable and are distinctly useful when fed in moderate quantities in conjunction with hay and grain in preventing constipation and other resultant ills which so frequently occur when sheep are changed from pasture to dry feed.

In the experiments upon which these conclusions are based, turnips were fed at the rate of five pounds per animal in connection with ¾ to 1 lb. of mixed grains and 1½ to 2 pounds of clover hay, the daily cost of the ration being 3½ cents per animal.

THE STEEL COMBINE TO CONTROL PRICES OF WIRE FENCE.

The Sarnia Fence Co's Plan to Prevent it

The London Free Press, on Dec. 28th published an announcement to the effect that Hamilton is to be the Steel centre for Canada, that the Steel Corporation of Canada, which is composed of iron manufacturers who recently merged their interests under the above name and who are endeavoring to control prices for Canada on all steel and iron products. This gigantic combine is rushing to completion at Hamilton, new buildings and plant and spending millions of dollars on their equipment. We are told that the Steel Corporation of Canada, have assurances from the Borden Government at Ottawa, that they will be afforded protection either in the form of a duty, or a bounty on steel and iron products. We cannot believe that this is so, particularly in view of the fact that free fence wire was given, as a concession to the farmers and in spite of the protests of the iron manufacturers, but if by any possibility such a change should be made you may rest assured that you will have the privilege of paying the duty or bounty as the case may be.

One of the items which is of very great importance to the farmers of Canada, is wire fence. For a great many years, the sizes of wire used in the manufacture of this farm necessity, have been admitted free of duty, but a duty of 15 per cent was retained on finished fence. The Canadian fence manufacturers formed a combine of their own in order to pocket for themselves the full protection of this 15 per cent. In fact they came to look upon this 15 per cent protection as a legitimate addition to their ordinary profits.

Three years ago the SARNIA FENCE CO., opened a plant at Sarnia, and in compiling their prices, they based their profits upon a reasonable return for their money invested, leaving out of their consideration, the matter of duty or protection. The result was a very decided difference in the prices of the fence combine, and those of the Sarnia Fence Co. Needless to say that many threats were made by the combine, and methods fair, and otherwise were resorted to in order to prevent the Sarnia Fence Co., placing their fence on the market. After practically three years fight, the Sarnia Fence Co., came out on top with the largest and most modern fence plant in Canada, and 25,000 Canadian farmer customers at their backs. Now that we, with the assistance of the farmer, have made the existence of a fence combine in Canada impossible, shall the present Government hand over to the Steel Corporation of Canada a weapon in the form of protection on fence wire which undoubtedly would be used as a club to knock more dollars out of the farmer. By the placing of a duty, or by the giving of a bounty on wire rods, or fence wire, we will be deprived of the right to purchase in the open market, which assures us of a fair price on wire. We will have to look to the Steel Corporation of Canada, who will not permit us to purchase wire at a price, which will be any competition to them in the finished fence. They ask the Government for protection, in order that they may be able to control the market and compel the consumer, (which in this instance is the farmer exclusively) to pay the highest possible price.

Are you, the farmers of Canada, going to stand for this, let every farmer write his member, or call upon him personally, and protest against the giving of either a bounty, or the placing of a duty on fence wire. This means dollars taken directly from your pocket and is worthy of your most vigorous protests. You are a voter and if the farmers stand together they can head off such an outrage. We, the Sarnia Fence Co., ask for no protection. We can stand on our own footing, and will undertake to protect the Farmers of Canada against a fence combine providing, the Government will not yield to any such unfair demands from the iron and steel interests, and refuse the Steel Corporation of Canada an unfair advantage in the Canadain market at the expense of the farmers of the Dominion.

The Sarnia Fence Company, will from time to time, keep the farmer posted on the action of the government in this matter and we ask your assistance and support.

Yours very truly,

THE SARNIA FENCE CO., LTD.

Soiling Crops.

The following notes are taken from a letter written by W. M. Kelly, a well-known and successful dairyman of New York state, to the agricultural press. Many valuable hints can be found of special interest to dairymen.

The time when dairy cattle can be turned out in the summer to shift for themselves has passed. Under the best conditions, the abundance of pasture grass is certain to decrease after the middle of July, and its quality also deteriorates.

To sustain an even flow of milk we must be prepared to supply additional food. A milk-flow, allowed to decrease at this time, cannot be fully regained until the cow again freshens.

The cow that is giving milk and the growing heifer, suffer a severe shock, from which they are slow to recover if compelled to fight flies, and exist on semistarvation rations, in a drought-stricken pasture.

Many dairy farmers make the mistake of allowing the cows to shrink in their flow of milk, before beginning to feed the supplemental feeds.

Supplying these as soon as the pasture begins to fall, makes the change more gradual, and insures an even, steady thrift of the cows, which is so essential to sustaining a large flow of milk.

Another very common mistake made by many dairy farmers, is that of feeding a heavy grain-ration to the cows when a bare pasture is their sole supply of rough food. Such roughage is neither palatable nor abundant enough to produce good results.

On the modern dairy farm where corn, clover and alfalfa thrive, it is unnecessary to plan an extensive and complicated system of forage crops to supplement the pastures.

The supply may be obtained by holding over ensilage, or by cutting clover and alfalfa, and feeding them green in liberal quantities.

Oats, peas, rye, barley, and various other crops, may be specially grown for summer feeds, but none of these crops will yield as much as corn, clover, alfalfa and oats, and peas that are raised in the regular crop rotation.

The only real advantage of growing the former feeds, lies in the fact that they may be sometimes raised on land not used for growing the crops in the regular crop rotation.

I believe it generally unwise to practise a complicated system of growing catch crops, when it is possible to obtain equally good results from the green feed supplied by the regular field crops.

In actual practise, I have depended chiefly upon corn, oats and clover and peas, for soiling purposes during the summer, harvesting as much of each crop green as was necessary to balance up the deficiency of pasture grass.

The corn ensilage has the advantage of being at hand in case the drought comes unusually early in the season, when it is difficult to get soiling crops to grow heavily enough. Corn is about the best grain and soiling crop.

This fact has been a stumbling block to many farmers. In trying to save grain and ensilage for winter feeding, they have allowed many dollars to slip through their hands, by underfeeding in the summer.

The same holds good when clover and alfalfa are saved for hay, when the cattle are suffering for succulent food. In no way can we realize greater feeding value from these crops than by cutting and feeding them green.

It is the height of folly to save clover and alfalfa for hay, and allow it to lose feeding value from rain and heat before feeding it to the cows, if they are suffering in a parched pasture for want of this kind of food.

It is common to see a herd of dairy cattle in the late summer, stamping dust from a dried-up pasture, fighting flies, and vainly endeavoring to break through a fence which holds them out of a luxuriant field of corn that flaunts its prodigious wealth of dark-green foliage before them.

It is a penny-wise and pound-foolish policy to allow cows to fall away in the milk yield and condition, when a few rows of rankly growing corn would keep them in good condition.

It is true, that when corn is cut green, it has less feeding value than when it is mature, but the ripened stalk and leaves are largely wasted, as much of the crop is harvested.

When cut and fed green, there is scarcely any waste, for the whole stalk, leaves and grain are eaten.

While corn in its roasting ear stage has less total nourishment than the whole plant when matured, yet when cut at this time it will actually give better results than when husked from the standing stalk, and fed later, after the cattle have fallen away in their milk yield and flesh condition.

More than one half of the run-down condition of dairy-cattle during the winter, can be traced to a decline in condition before they go into winter quarters in the fall.

Hollow Horn.

This old-fashioned term denotes a diseased condition of the blood. The old quack method of boring a hole in the horn with a gimlet and squirting turpentine into the orifice is both cruel and ridiculous. While, in fact, the temperature of the horn is low, it is because of the general poverty of the blood of the animal. There is no merit in this kind of treatment. The most common symptoms are general debility, scanty flesh, scurvy coat and coarse hair. The appetite is also irregular and at times greedy.

Treatment is in line of better food and general improvement of the system. If lice are found on the body, they must be destroyed by disinfectants and washes. A tonic consisting of two teaspoonsful of sulphate of iron, one teaspoonful of powdered nux vomica and four tablespoonsful of ground gentian root given each day in the food or as a drench, will be very helpful in toning up the system and in enriching the blood. The most important factor of the treatment however, is in nutritious, wholesome food.

Is Salt Injurious to Pigs.

A question which very often arises with pig-owners is whether salt is really harmful to pigs. On this point there is some difference of opinion, but the general consensus is that in any considerable quantity salt is very injurious to swine. This is not disproved by the statement which is sometimes made that one has occasionally fed a little salt to pigs and found that no harm has resulted. What happens is that in many cases the pig wash that is used on farms is made up of all sorts of household refuse, in which water containing salt and soda are dissolved. No definite idea can be formed by the feeder as to what proportion of salt it may contain, but it is fed to the animals freely, and there is little doubt in the minds of experienced men that the practice accounts for many of the mysterious deaths of pigs. Some years ago a discussion took place in our columns, and we had the usual conflict of testimony, but one affirmative is worth a very large number of negative statements, and we think that readers will do well to act on the assumption, which has been found to be correct by many feeders, that the less salt given to pigs in their food the better, and they will do well to be on their guard when making use of wash from hotels and like sources.

Neat's-Foot Oil.

Simply because of lack of facilities for utilizing them many parts of animals killed upon the farm necessarily go to waste. One part, however, usually wasted may be saved and turned to profitable account. The hoofs of beef animals may be made to yield the rather expensive, very useful neat's-foot oil with little trouble. The method is as follows:

Wash the hoofs thoroughly and put them in a kettle to simmer slowly in rain water. Continue the simmering from three to five hours, preferably not less than four, then allow the kettle and its contents to cool. By morning of the next day the oil will have parted with much of its impurities which will have sunk to the bottom of the kettle if plenty of water has been used, that is, if the pot has been kept full even until it was removed from the fire. The oil may be skimmed off and put in fresh boiling soft water and allowed to settle until cold. This is to allow the fat to separate from the oil and to get rid of any impurities that may be present when removed from the kettle. The fat may be used for soap-making.

Neat's-foot oil is an excellent lubricant for machinery because it will not thicken or gum. For softening leather it has hardly an equal. The usual quantity secured from the hoofs of a single ox is approximately a pint, but for even this small amount the work involved is not excessive. To reduce the trouble, however, the hoofs of several animals may be saved and boiled at one time provided the weather is cool enough to prevent their spoiling.

When a Soil Needs Lime.

There is only one sure way of determining whether a soil needs lime and that is by trial. An application of lime over a whole field would be a waste of both time and money if the field were not in need of such an application. It is suggested that the farmer who has not already proved for himself whether his soils need lime would better conduct a few simple experiments at different points on his farm.

A few barrels of lime or a few tons of limestone would not cost a great deal and the labor of treating a strip with lime or ground limestone here and there across different fields in which crops were to be grown or so treat a small area here and there, at different points in the fields in which crops are to be grown, would involve but a small amount of labor. These areas should be very carefully located and marked and the results of the applications should be carefully studied on the succeeding crops. It is possible that the effects, good or bad, may be easily apparent. It is possible that the effects can be discovered only by carefully cutting and weighing the crops from portions of the treated areas and comparing them with the crops produced upon equal adjacent areas.

Lime should not be applied to land nure piles nor to the litter in the barn.

Lime should not be applied to and being prepared for potatoes.—Circular 11, Michigan Experiment Station.

Home Soldering.

A neat bit of soldering can be done with a sheet of tin foil when the parts to be joined fit well. After treating the edges with a good flux, clamp the parts firmly together with the tin foil between and heat thoroughly. The heat must be applied so that the foil is entirely melted, and then care must be exercised to have it cooled and crystalized before the clamps are removed.

To do the best work in soldering, it is, of course, necessary to do away with all corrosions and metallic oxides before applying a flux. The usual fluxes for soft soldering are resin, sal ammomiac and muriatic acid. Use the chemist's zinc chloride, which comes in anhydrous crystals, and dissolve it in alcohol, add a little glycerin to make it adhesive, and apply to the parts before soldering. The alcohol in the preparation lights when applied to the metal if the surface is hot enough, and in this way serves to indicate whether or not it has been fired sufficiently. The proportions in which the ingredients of this flux may be used vary according to individual taste, but the following will be found generally satisfactory: Zinc chloride, 5 parts; alcohol, 4 parts; glycerin, 3 parts. Or this Zinc chloride, 2 parts; glycerin, 3 parts; alcohol, 5 parts.—Exchange.

The Dairy Cow.

The dairy cow holds a unique place in the civilized world. In her relation to man she stands out superior to all other domestic animals. How necessary to the comfort and well-being of the human race are her products! She contributes largely to the food of the poor and the rich, the young and the old, the inhabitants of the cities and the rural districts. Her product is what nature has designed for the young, both of man and the domestic animals. And for all ages it is the least expensive of foods, the most healthful and the most desirable.

No meal would be complete without the product of the cow in some form. She has been termed the "Godmother of the human family." Her importance is tersely expressed in the following quotation: "There is nothing, aside from the milk of human kindness, so necessary to the comfort of any family as the milk of a good cow. It is like oil poured upon the waters of life; it is a perfect food for the baby; it is an excellent beverage for the children; it furnishes cream for the coffee, butter for the bread, and cheese for the lunch. It shortens the pie crust, and raises the johnny-cake; even the cat and dog cry for it."

With the farmer it goes still further. It raises the calf, it feeds the pig, it pleases the colt, and it delights the children. Yes, and if he will only give her a fair chance, the cow will clothe the children, buy comforts for the wife, pay the taxes and help lift the mortgage.—Bulletin, Maine Department of Agriculture.

Milk Rapidly.

Rapidity is one of the great essentials in milking a cow. Massage by the hand on the udder of the cow excites nervous action and in turn stimulates action of the milk glands. The more rapid are the massage movements, the greater is the nervous stimulation of gland action and the greater the amount of milk that will be yielded. Not only is this so, but the faster the milk is drawn, the richer it will be in butter fat. Often there is a difference of more than 10 per cent. of butter fat in milk between fast and slow milking in favor of the former.

One can learn to milk fast without yanking as well as to milk slow, and when once rapidity is acquired it is easier than the slow process. A good milker will sit down to a cow and draw all of her milk in a very few minutes, and the faster the milking is done, the better the cow seems to like it and the fewer movements she makes. The cow that is milked slowly is slow about giving down her milk, and repeated slow milking will cause a cow to dry up sooner than by rapid milking.—Successful Farming.

The Worth of a Wagon Lies in It's Tires.

Wheel and tire troubles are over for the man who equips his farm wagons with T-K Wide-Tire Steel wheels. They will carry 25 to 50 per cent. heavier loads in deep mud or over the rockiest roads without delay or danger of accidents. They make farm work lighter; stand any strain and are proof against breakage.

T-K Wide Tire, Steel Wheels and Handy Farm Wagons

This is the sort of wagon you want for doing all kinds of work around the farm. It is handy for loading and unloading, will carry as great a load as any team can haul, and because it never needs repairs, it is the most economical wagon on the market.

Judicious Rotation.

The editor of the Wallaces' Farmer discussed, some time ago, the question of the rotation of crops in a way that ought to make the subject understandable even to the man of the least scientific turn of mind. Now that the season for plowing and preparation for next year's crops has commenced, the subject of the proper rotation of crops is a very much alive subject, and we are giving Wallaces' Farmer's dissertation in reply to a subscriber's expressed doubts on the subject. This is not because we think there are any Maine farmers who doubt the wisdom of rotation. Wallaces' Farmer said:

An Illinois subscriber writes:

"You advocate the doctrine that rotation of crops will increase the fertility of the land. I am of the opinion that it will neither conserve fertility nor increase it. A rotation may be advisable on account of insect enemies."

That depends on what kind of a rotation you adopt. A rotation of corn, oats and wheat, or of corn, barley and wheat, or of wheat and flax, or any possible rotation made up entirely of grain crops to be sold off the farm, will certainly not increase the fertility of the soil, nor will it conserve it. On the other hand, it will most certainly decrease it, first by wasting the humus, which contains most of the nitrogen. The residue from these crops, even if the stubble and corn stalks are carefully turned under, will not supply the humus material that is wasted in the very process of cultivation itself. Unless a larger supply than these crops can furnish is given from year to year, the black soils will become brown and brown soils a lighter shade as the years go by.

Furthermore, rotations of this kind will waste the patash. In Illinois this is not a serious matter, however, as there is enough potarh in Illinois soils for hundreds of years to come; but it will also waste the phosphorus, which is the limiting element of fertility, and sooner or later under a rotation of this sort farmers will have to resort to commercial fertilizers.

We do not regard any rotation as beneficial unless one of its prominent factors is a leguminous crop. It may be one or all of the clovers; it may be alfalfa; it may be cow peas or soy beans; but the fertility cannot be maintained without some leguminous crop. It is perhaps possible to maintain fertility by growing clover and plowing it under, although we would not say that this is possible in soils in which the limiting element is phosphorus. The clover will supply more or less nitrogen. If plowed under it will add largely to the supply of humus material. It will not add either potash or phosphorus, however. On the other hand, it will in time lead to the decrease, more or less rapid, of the total phosphorus content of the soil, because, being deep rooted, it will bring up a supply from below and put it within reach of ordinary plants. If these crops are sold off the land, a loss of fertility must inevitably follow.

Nor do we say that a rotation of crops in connection with live stock growing will prevent ultimately more or less waste of phosphorus. However, on a live stock farm where the great bulk of the crop is fed and the manure hauled out, a rotation involving clover will maintain the fertility on naturally good land for a long time to come.

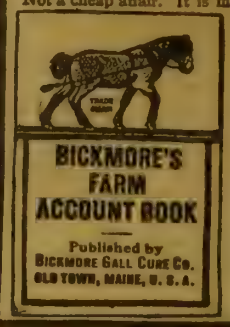
Let us see how it does it. It maintains the supply of humus material, or, in other words, vegetable matter. It therefore keeps the soil in fine physical condition and renders the fertility more immediately available. It increases the nitrogen supply. It does not increase the phosphorus, however, but economizes it by restoring to the land every year a very considerable percent of the phosphorus that was taken from it. It will maintain the fertility to a period after which the present owner of the land may have an immediate personal concern about it, however much his children and grand children may need to concern themselves.

In short, the best way that we know of to maintain fertility and to restore it so far as nitrogen and vegetable matter are concerned, is a rotation of crops in which the clovers are given a large place and other grasses a subordinate place. By this method fertility has been maintained for hundreds of years in the older countries, and will be maintained in this country when farmers get down to real, practical, scientific farming.

FREE-FARM ACCOUNT BOOK

Know How Much You Make This Year

No one shall pay a cent for **Bickmore's Farm Account Book.** It will be sent free to any farmer who will be good enough to tell who and where he is. The cost of a crop never demanded closer attention. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical, than trying to remember them; shows what to charge against crop production; has a laborer's time record; and section for personal accounts. **64 pages; for ink or pencil.** Not a cheap affair. It is meant for business. Its quality is in keeping with



BICKMORE'S GALL CURE

a remedy that **cures,** and the horse works all the time. Users keep it in their stables the year round—they believe in it. It is always ready for Harness or Saddle Galls, Chafe, Rope Burns, Cuts, Scratches, Grease Heel, etc. In cows use it for Sore Teats. Don't buy a substitute. Insist on getting Bickmore's Gall Cure—for the sake of your horse's health. But write now for Bickmore's Farm Account Book—it is ready for **you.** No cost. No obligation. Send your name and address—that's all.

The Dairy Bull.

There is an old saying among stockmen, "Never take any chances with a bull." This is wise with dairy bulls as with those of beef breeds. All must be handled with care. Any bull at some unexpected moment may injure or kill any person he meets.

The bull as a rule never becomes vicious until he has attained age, and some have never been known to give trouble. But very tame ones sometimes turn out to be dangerous. By securing the dairy bull as a calf and handling carefully he may be raised with a small amount of trouble, and perhaps never do any damage. By instinct most male animals will fight with provocation, and they resent annoyance from dogs or human beings. Never permit anyone to annoy the bull either as a calf or as an adult animal. Poking or "teasing" them will make them mad and resentful. Avoid going or allowing anyone to go, in the pasture or lot with red or highly colored clothing. A boy with a red sweater must stay out of the bull pasture.

Fit a good strong ring in the bull's nose, and never attempt to lead even

FREE

Handsomely Decorated Dinner Set

Ladies. We will give you this beautiful full size dinner set absolutely without cost.

This is the Chance of a Lifetime. An Honest Proposition.

We will give away free 1,000 of these handsome dinner sets, beautifully decorated, each set 53 pieces, latest designs, handsome patterns, full size, for family use. A magnificent and complete set to quickly introduce and advertise Dr. Burdick's famous New Life Vegetable Pills,—the wonderful remedy for indigestion, constipation, unhealthy blood, rheumatism, to stimulate the appetite, regulate the bowels, and clear the complexion, an invigorator, tonic, and life builder. We will make you a present of this handsome set, exactly as we claim. Take advantage of this if you want to get a handsome set of dishes for your home, absolutely free.

All We Ask You to Sell is Only 12 Boxes at 25c a Box

of Dr. Burdick's famous New Life Vegetable Pills. Being determined to gain a national reputation as the most progressive firm in Canada, and to gain a wider distribution of our strictly pure, high-grade remedies, we are going to assist you to sell our medicine, and to earn this beautiful set quickly by sending with each box of pills a certificate by which every purchaser can receive from us a Handsome Box of Presents consisting of 1 handsome solid gold shell ring, plain engraved, and chased or set with beautiful sparkling jewels, equalling in appearance the finest diamond rubies and sapphirs, etc. 1 sacred Resurrection Plant of Egypt—The Rose of Jericho as spoken of in the Bible; 1 pair gentlemen's imported Lever Cuff Links, Gold finished, your choice of a handsome Silver finished Sugar Shell, silver finished Butter Knife or Silver finished Pickle Fork; one cabinet photograph of our King in his royal uniform, and our Queen in full court dress. This magnificent box of presents, exactly as described, we will send fully prepaid to every one who purchases a box of our medicine from you, and will return us the certificate with only 50c. to cover cost of packing, mailing, etc., the different articles. Our object in making this wonderful offer is to induce people to try our medicine, and to receive the opinion of every purchaser, and this we will get when the certificate is signed and returned to us. This liberal offer makes it impossible for you to fail. Your friends will be delighted with this wonderful opportunity to secure a handsome box of presents.

Don't miss the opportunity of a lifetime. Write us to-day and agree to sell only 12 boxes, and return the money, only $3.00 to us. We trust you with our medicine till sold. As soon as your remittance and the certificates have been returned to us, we will promptly ship the dinner set to you. We arrange to stand payment of all freight charges to your nearest station. We are bound to introduce Dr. Burdick's famous medicine no matter what it costs us and when we say we will give away these handsome sets of dishes, we will do it. **Our methods are honest. Don't miss this great opportunity.** Write to us at once. Address.

How to Stimulate Production of Nitrogen in the Soil.

Extract from

"Artificial Fertilizers; Their Nature and Use."

By B. Leslie Emslie, C. D. A., P.A.S.I., F.C.S.

"If the farmer grows a crop of clover or other leguminous crop, having in view the enrichment of the soil in nitrogen, he will naturally wish to have as big a crop as possible, and the way to ensure the proper development of a nitrogen-gathering crop, so as to enable it to rob the atmosphere of the quantity of valuable nitrogen, is to see that the crop is provided with a sufficient supply of the other plant food viz. phosphoris acid and potash.

No factory can be kept going unless regularly supplied with the motive power nessary for the evolution of the finished product; no more can this nitrogen factory in the soil maintain its productive capacity unless a regular supply of power in the form of phosphoric acid and potash be available. Legumes, although independent of an artificial source of nitrogen are nevertheless very dependent on an easily assimilable supply of the other plant foods."

Farmers can obtain copies of this and other bulletins, treating of this important subject, by applying to

GERMAN POTASH SYNDICATE,
Temple Building, Toronto, Ont.

the gentlest one without having a lead staff snapped into the nose ring. This insures safety.

If there are no good dairy bulls in the neighborhood, it will pay any dairyman with more than half a dozen cows to own a purebred male. He can be purchased reasonably cheap as a calf; outside service fees will pay his keeping, and good grade dairy stock can be secured through him. The advantages of owning your own bull are that time is saved in taking the cows away for breeding and service can be secured at any time.

The bull to be strong and vigorous and of good use must be fed, sheltered and given exercise. The stall should be roomy and strong, but not boarded up tight. The animal will be better contented if he can see out and have plenty of light. A lot or small pasture for open exercise is necessary for health and vigor. Clean stall and good general sanitation should not be neglected. An unhealthy or filthy bull will soon mean a diseased herd.

Where the regular pasture is fenced "bull tight," and no women or children ever pass through it, the bull may possibly be allowed to have this large area for grazing and exercise. He is more contented in pasture with some company—other bulls, pregnant cows or calves.

For exercise, some dairymen have the old fashioned tread power for running the separator or other light machinery. The bull is given daily exercise in this mill, just enough to keep him healthy and strong.

As to feed, the bull requires a lot of nourishment such as is good for the cows, but not so much as for a cow giving milk on full feed. It is a mistake to feed this breeding animal only hay or fodder in winter. Good clover or alfalfa hay, sillage and a small amount of corn, oats, oil meal and bran should constitute the daily ration. The young, growing animal should be fed rather more liberally and be allowed greater freedom for daily exercise than the mature bull.

Fall and Winter Pigs.

Whether to have fall and winter litters or not depends largely on conditions. If you have warm, dry quarters, plenty of good straw or litter with which to keep the pigs comfortable, they can be grown during the winter and fattened at a profit at present prices, i e, 10 to 12 cents a pound for pork dressed, especially if skim milk is used in connection with wheat middlings (not reground bran). Don't over do the feed question. Just feed heavily enough to keep them growing good until four months old, then begin to gradually add corn meal to the ration until at five months of age the pigs are receiving three parts corn meal and two parts wheat middlings and one pound of this mixed grain to three pounds of milk until you are ready to butcher them. They will stand up under such feed better than if you had fed a larger proportion of corn meal.

However, the corn meal can be safely increased for the last twenty days just previous to killing. A few roots should be fed twice each week during the entire period, as a conditioner, also some earth should be furnished the pigs once a week, at least. Keep them clean from vermin also dry and warm. Under such conditions they should dress 150 pounds each at six months of age. At present prices of grain $6 to $7 worth a pig should finish them. This leaves a good margin for milk, labor and investment.

Now, if you lack above conditions and can't supply them, don't try to have fall or winter pigs, as the result would be stunted runts, hence lack of profit. The boar hog should be fed wheat middlings, oats and a little whole corn scattered in a chaf litter in whice he can exercise. A drink of milk or water should be furnished twice each day with the ground oats and middlings equal parts mixed in it. Feed well enough so as to produce thrift and growth but do not force or overfeed. A yard should be furnished in which he may exercise. He should never be allowed to run with the herd. It is best never to use the boar until one year old or over, as otherwise you weaken his constitution and he will lack vitality, hence produce disappointing litters of pigs. Furnish dry, warm sleeping quarters. A hog can stand cold better than damp. A dry bed is always essential to thrift.

Winter Ventilation.

Avoid direct draughts, either over or under the confined animals, in front flank or rear.

Small openings under the doors may admit a draught, and the effect of such a passage of air may best be realized by standing still in it yourself for a few minutes.

Since breathed and re-breathed air has been robbed of its life-giving oxygen, an improperly ventilated barn or poultry building is not only unhealthy, but is colder than a building amply ventilated, where the foul air passes out and the fresh air enters.

During bitter cold, stormy or very windy periods one should have some means at hand for reducing the size of the openings for ventilation, or tack old gunnysacks over them, lest the extremely low temperature or the strong draught run the ventilation to detrimental extremes.

Diseases quickly spread through a whole herd or flock where their quarters are neglected as to proper ventilation, since the vitiated air will contain disease germs which, floating about the stalls, will be inhaled by all of the stock. This danger is still more potent since the advent of the dreaded tuberculosis among dairy herds.

Simply let the ventilation openings be in front of the stalls and a little higher than the animals' heads. The vitiated air thus will rise and pass out readily at one end, while the pure, fresh air will enter at the other, and by the time it reaches the stock in their stalls it will not be in the nature of a draught, but at the same time will be slightly warmed before entering the nostrils of the animals.—M. A. Coverdell.

Judge

Quaker Oats by the flavor. Taste tells you the difference when you get the cream of the oats.

Choice Oats are sifted 62 times to pick out the rich, plump grains. We get but 10 pounds of Quaker Oats from a bushel.

These choice grains, when prepared by our process, supply the utmost in oatmeal.

The richness and flavor, found in no other brand, has made Quaker Oats the world's breakfast.

It is worth your getting. For Quaker Oats, despite this quality, costs but one-half cent per dish.

Quaker Oats

Family size, with a piece of china beautifully decorated, 25c } Except in Extreme West
Regular size for city trade, 10c }

PETERBOROUGH, ONT.

Look for the Quaker trade-mark on every package.

Points on Wintering Sheep.

The question we sheep men will soon be asking ourselves is, "How can we bring our flocks through the winter in such a way that they will produce a strong, healthy crop of lambs and a good fleece of wool?" These are the two main products we must depend on for our profits.

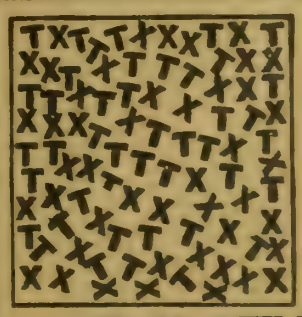
Some of the requirements to success are a healthy flock, suitable pen, good, wholesome food, fresh water and plenty of exercise.

The pen should be cool, free from draughts, light and of good height. The sheep should have free access to a sheltered yard. Nature has provided them with a coat that will protect them in any kind of weather (except wet, when they will stay inside themselves), and they will often be seen lying quite comfortably outside in the coldest weather.

For rough feed we find that nothing takes the place of clover hay, and when this is available very little else is needed. Good pea-straw may be fed the first part of the winter with good results.

When straw of any kind is fed it should be accompanied by a light ration of grain or roots, which should be increased as lambing time approaches. A gallon of oats to 10 ewes and two to four pounds roots would do very well for ordinary wintering.

The question of exercise is a more difficult one to solve. If left to themselves sheep are inclined to eat their feed and lie down again, especially where no yard is provided. A little refuse from the fanning mill, if fed in troughs on the gangway, or any bare spot, where the in-lamb ewes may be taught to go the longest way to it when their feed is being placed in the racks, will prove a benefit and keep the sheep from getting their fleece dirty with chaff, besides finding a market for all foul weed seeds.—O. Turnbull.



1912 CONTEST

COUNT THE Xs AND Ts

$100.00

GIVEN AWAY

And many other prizes according to the Simple Conditions of the Contest (which will be sent).

This is a chance for clever persons to win Cash and other Prizes with a little effort. **Count the Xs and Ts in the Square,** and write the number of each that you count neatly on a piece of paper or post card and mail to us, and we will write you at once, telling you all about it. You may win a valuable prize. Try at once.

SPEARMINT GUM & PREMIUM CO., Montreal, P.Q. Dept. 19

Laws Relating to Butter.

The Dominion laws which apply to dairy products are, in some respects, more stringent than similiar laws in any other country in the world. The manufacture, importation or sale of oleomargarine, butterine, or other substitute for butter manufactured wholly or in part from any fat other than that of milk or cream is absolutely prohibited. The manufacture of adulterated, process or renovated butter is also prohibited. The legal limit of water in butter is 16 per cent. The law also prescribes that "No person shall brand or mark the word 'creamery' or any combination of words which includes the word 'creamery' upon any box, package or wrapper, containing butter, nor sell or offer, expose or have in his possession for sale any butter contained in any box, package or wrapper upon which the word 'creamery' is branded or marked unless the butter contained in the box, package or wrapper consists wholly of creamery butter manufactured at one place, except as to butter in rolls, prints, or packages of less than 25 pounds in weight not intended for export and manufactured in a building with the appliances used in creameries."

The effect of the law relating to the branding of butter is that practically all butter made on farms must be branded, if marked at all as "dairy" butter and sold as such. Several parties have recently been prosecuted for violations of this provision of the law. A fine was imposed on the Montreal Dairy Company, Montreal, on February 11 for branding "dairy" butter as "creamery." Charles Dumais, of Montreal, was fined $400 on February 22 for carrying on the business of manufacturing oleomargarine. This was the first attempt in Canada, so far as is known, to carry on the illegal manufacture of oleomargarine. It is the policy of the Department to enforce these laws as strictly as possible. An inspector is constantly employed watching for violations.—J. A. Ruddick, Dairy and Cold Storage Commissioner, in "Census and Statistics Monthly."

A Great Help to Alfalfa.

Recently we passed a nice field of alfalfa nearly ready for a second cutting. The stand was good and the foliage very green. We were very much surprised to learn that the field had never been artificially inoculated. We had passed the field many times last summer and had thought then that it was a failure.

The owner cut it twice last year but received from both cuttings less than what one cutting will now make. In the fall there were big bare spots in the field and some farmers would have turned the crop under and would have had nothing to do with alfalfa again. The owner, however, did not do this. He probably had read what Mr. Wing, the alfalfa expert of Ohio, said of his experience. So in the fall he applied manure to the bare spots and this year he has been repaid.

Mr. Wing says: "From experience I feel sure that I had rather take a poor piece of land, well manured, for alfalfa growing, than a naturally rich piece of land with no manure." In another part of his book he says:

"I once saw a field sown in alfalfa in Canada that was so well inoculated that in six weeks after the alfalfa was sown, the tiny nodules were found on the roots and this field was the first sown in that neighborhood, nor was it artificially inoculated. It had simply been well manured. In other states I have seen the same curious results. In Iowa, on the experiment station farm at Ames, a field was sown in alfalfa. All the seed was sown the same day and in no way was the treatment of one part of the field different from the treatment of any other part, yet there was secured a fine stand of thrifty alfalfa on one side of the field and very thin and poor alfalfa on the other side. The explanation seemed to be that on a previous year one side of this field had been manured and sugar beets grown thereon. Yet all the field seemed very fertile, and Director C. F. Curtiss thought that planted in corn all of the field was rich enough to grow 80 bushels to the acre. But that addition of some stable manure a year or two previously made one side of the field eminently fit for alfalfa, while the other side remained in unprofitable condition so far as alfalfa was concerned."—Indiana Farmer.

Sound Dairy Sense.

It costs no more to feed and maintain the best milking cow than it does the poorer ones, and when the net returns to the farmer are taken into consideration there is no comparison as to which is the most profitable. As we proceed in our endeavours to become better farmers we must eventually realize that a good cow on the farm is one way of getting better returns from our high-priced lands. Having established a herd of high-grade dairy stock, it is the first duty of the farmer to learn the best methods of feeding for economy and milk production.

Keeping the cow herd in a healthful condition is another lesson which the farmer must learn. In the past there has been too much trusting to luck in this regard, and as a result the spread of tuberculosis in dairy animals has been more or less alarming in some states. Still the dairymen are the first to scream persecution whenever the state or city authorities begin a crusade to clean up the dairy herds.

Ultimately it will be to the dairymen's advantage to weed out the animals which are lacking in robust health. By breeding up the herds and practising latest sanitary methods of dairying they will keep the well-bred cows in a sound condition of health.

Work the Stallion.

What are you going to do with that big, fat stallion, now that the breeding season is over? Going to leave him in the stable to fret and contract bad habits, turn him out to pasture and let him fight it out with the barbed wire or take him in to the harness maker and have a good collar fitted to his shoulders? Is there any reason why he should not pay his way like the rest of the horses? He is the most expensive horse on the place and therefore he owes you more. Make him earn it. The better bred and the more high priced he is, the better he should work. Nothing will keep him in better health or temper than work. It will also insure a larger percentage of foals and will show the farmers around you that your horse is made of the right kind of stuff. Let him be seen in the field doing the kind of work that is expected of his progeny. See that his harness manners are good and he will be admired both for his quality and utility. Nicely groomed and neatly hitched he is bound to attract favorable attention. Give him a chance to advertise himself and if he has the right kind of stuff in him he will make good. An idle horse is as useless as an idle man.

Species Used for Pulpwood. 1910.

Four species of wood were used to make up the six hundred thousand cords worth three million, five hundred and eighty-five thousand dollars, that were used by the pulp mills in Canada in 1910. These woods were spruce, balsam, hemlock and poplar, as ascertained by the Dominion Forestry Branch in a report soon to be published on the pulpwood consumption. The percentage of spruce, which has always been the chief wood used is gradually becoming less, although still forming over three-quarters of the total pulpwood consumption. In 1908, spruce contributed 87 per cent of the total; in 1909, 83 per cent; and in 1910, 78 per cent. The importance of balsam, the second species as a pulpwood, is increasing. In 1908 it formed 12 per cent of the total; in 1909, 16 per cent; and in 1910, 20 per cent. Another species which is rapidly becoming more important is hemlock, over five times as much being used in 1910 as in the year previous. The use of poplar fell off over one-quarter, a consumption of only three thousand, six hundred cords being reported for 1910. Spruce was the most expensive species at $6.05 per cord or 64 cents more than in 1909. During 1910 balsam became reduced 55 cents to $5.71. Hemlock remained at about the same price for the two years and is still the cheapest species. In 1909 it was $4.51 per cord and in 1910, $4.43. Poplar has increased eleven cents during the year, the price being $5.92 in 1910. The prices of pulpwood are affected not only by the properties of different species, but also by the conditions under which bought (whether in open market or on limits), and by the distance of the wood from the point of consumption.

Save the Farmer Boys From the City.

Fall work is at an end, crops have been bountiful and the harvesting and preparing for spring have meant long hours of hard labor. But now there is a lull in farm activity and the boy of from seventeen to twenty-one years of age, who has worked hard all the season begins to feel discontented. He begins now to feel as himself that he is not needed at though he wants a change and thinks of going to the city to work in some shop or mill.

Why does the young man from the farm wish to leave the home and take up strange work in a strange place? Let us look at the matter from the boy's point of view. He has worked in the field from morning until night from April to November. He has done the heaviest part of the manual labor. Certain work he has done because it is necessary to ensure the success of the crop. He does not see the reason for his labor. His father manages the work and the boy stands in much the same position as the hired man but usually receives no wages. When he wishes a dollar to spend he must ask for it and it is a very hard thing for an independent young man to ask for money. In the season of relaxation following the rush of work the boy wishes to enjoy his leisure in his own way. A new suit of clothes that he may attend an entertainment or dance; for the young man of to-day must be well dressed whether he be in the country or in town.

The day when anything in the way of clothes—the cheapest—would do for the boy is past. The electric car and steam railway have brought the city almost to the farm gate and the young man will be so dressed that he may hold up his head and feel the equal of his city-bred cousin.

The city gives the boy the chance of earning his own money and of spending it in his own way. He says: "I will go to the city and work in the shoe shop this winter." But if he goes to the city for the winter he will not return in spring, for, never deeply interested in the work of the farm, he will easily persuade

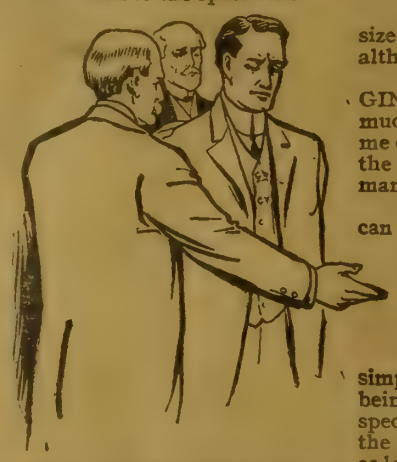
DOCTORS AFRAID TO OPERATE

Could Not Remove Stone From The Bladder. Gin Pills Enabled Him To Pass It.

JOLIETTE, P. Q.

"During August last, I went to Montreal to consult a specialist as I had been suffering terribly with Stone In The Bladder. He decided on an operation and was assisted by another doctor. They said the calculus was larger than a bean and too hard to crush, and that they could not take it out.

I returned home suffering greatly, and did not know what to do, but was recommended by a friend to try GIN PILLS. I bought a box and found relief from the pain at once. I took a second and third box of GIN PILLS after which I went back to the specialist.



THEY COULD DO NOTHING FOR HIM

He told me the calculus was reduced in size, still he could not relieve me of it, although he tried for two and a half hours.

I returned home and continued to take GIN PILLS as they reduced the pain very much, but I did not expect they would relieve me of the stone, but to my great joy, I passed the stone on October 3rd, and am now a well man and very happy.

I am sending the stone to you so that you can see for yourself what a great work GIN PILLS did for me. GIN PILLS are the best medicine in the world and because they did so much for me, I will recommend them all the rest of my life".

J. ALBERT LESSARD.

Isn't it wonderful? Just think of these simple pills, that even children can take, being able to perform what the greatest specialists in Canada could not do. Surely, the days of the miracle have not passed away, as long as we have Gin Pills. These wonderful pills dissolve stone in the bladder or kidneys because they are a natural solvent for uric acid, which causes calculus. If GIN PILLS are not sold in your neighborhood, send us 50c. for a box or $2.50 for 6 boxes. Sample free if you write us mentioning this paper. National Drug and Chemical Co. of Canada Limited, Dept. M F Toronto.

MANGA-TONE BLOOD AND NERVE TABLETS are especially for women and girls to make them well and strong and rosy. 50c. box. 113

home and he will stay and be his own boss.

Now, "fathers," in a few years your hands will not be so steady, your steps will not be so firm as they may be now and you will regret more than ever that your boys are gone, that there are none of your line to take your places and carry forward with even greater ability the work you have but just begun; and, "fathers" have you not dreamed of the symbol, --Father & Son," upon your letter heads?

Then pay the boy wages—spending money. If he is the right kind of a boy he will not ask too much. And pay it before he asks for it. Then, "fathers," you are in a rut. Your cycle of years is as a treadmill, always running in the same groove, maybe worn by your fathers. Jump out of that rut, get your bearings and go ahead on an advancing line, for the science of agriculture, farming, never stands still. Then send that young man to a school where he may learn why fertilizer makes crops grow, why he uses one grade for corn and still another lor potatoes. Let him mingle with other young men who are, with him, engaged in studying nature, as she will aid him in farming for profit.

If you are not able to send the boy for a longer time, the agricultural schools all offer short courses of one or two months in which one may study dairy problems or poultry management or other points of special interest to the man who conducts his farm for a revenue.

Let the boy rub shoulders with other boys, earnest and interested, all tending toward the same goal and some day, Mr. Father, you will perhaps see your dream of partnership come true; and when you are compelled "to lay down your implements on earth, you may enter that paradise, not made with hands, eternal in the heavens," and feel that your work has been well done, and that the future of agriculture is secure.—Clarence R. Leland in Maine Farmer.

Here we have a young man's view of a most important question well set forth. The time is not so far distant when we experienced the feeling that a small sum paid as a just compensation for labor well performed on the farm had a double value. The father who freely gives the son what he can afford, even though it be little, when the son has been diligent and faithful, will find that still better effort will be secured and what is better, a genuine interest will be taken in the work and soon more liberal payment will be possible. The boy is a man in miniature, and should be treated fairly.

Pure-Bred Bulls on the Farm.

The number of pure-bred bulls in use on farms is far below what it ought to be; still farmers are taking much more interest in grading up their cattle than they did a few years ago. Especially is this true of the dairy farmers who are depending upon their milk cows for a steady cash income. Many of these men are also beginning to realize that so long as they are going to milk they might better milk good cows—cows that produce from 200 pounds and upward of butter fat a year.

The farmers with a herd of from fifteen to twenty cows cannot use a bull more than two, or at the most three years, as he must avoid inbreeding. If a bull is bought at the age of from 12 to 18 months he must be disposed of at 4½ or 5 years—at a time when he has reached the stage of greatest usefulness. Such bulls, if they are good breeders, ought not to go to the block; they should be retained for service on other farms. The average man, however, finds great difficulty in selling a bull that he has used for a number of years, since there seems to be a prejudice against buying a second-hand bull.

The real breeding value of a dairy bull cannot be determined until his heifers come into milk; consequently a bull 5 years old should be a safer animal to buy than a young one that has never seen service. We would advise our readers never to let a chance pass to buy a good dairy bull that has been in use in some neighbor's herd for two or three years, provided the bull has proved himself to be a good sire. You will be able to buy a bull of this kind in many cases for a little less money than he costs as a youngster; but even if you cannot do that—even if you must pay almost as much as the original purchaser paid for him as a calf—provided his offspring has shown him to be a good sire—buy him anyway. Not all bulls that look well prove to be good sires. A bull may have the right conformation as a youngster; he may appear to be almost perfect in every detail, and may even come from high-producing ancestors, and still he may not prove to be as good a sire as some other bull with apparently fewer individual qualities to recommend him.

Don't be afraid of old bulls. Of course, there are some precautions to be taken when purchasing a bull from another herd. Be sure that there is no abortion in the herd. Under no condition buy a bull from a herd in which this disease has existed during the last two years or so, but where the herd is healthy and the young heifers—the offspring of the bull—are what you think dairy heifers should be; then don't hesitate. You can only use a bull three years yourself, and a 5-year-old will be none too old when you must sell him. He will then bring as much on the market as he would as a 3-year-old, and you have had the benefit of using a sire the breeding power of which you have had an opportunity to observe before buying.

Some of our best dairymen prefer to buy bulls well advanced in years for the very reason mentioned above. Some also contend that an old bull is likely to be more prepotent than a young one, and that he will transmit greater vigor and vitality to his offspring. Whether the latter is true or not, it is certain that a bull from 5 to 8 years old is as valuable in that regard as one younger.—W. M. Phillips.

Your Life Partner.

The following story appeared in a recent issue of Successful Farming. It is so applicable to conditions that are far too common that we pass the article along to our readers:

They sat in the office of the man who drew up papers for folks.

"We've decided to separate," the man said, "and we want you to get up the papers."

Something like a sob came from the woman's lips and she drew the baby closer to her side.

The lawyer fumbled about among the papers on his desk, then took off his glasses and said quietly, "I wish you would tell me all about it." Then the little woman broke in:

"We would like to tell somebody about it—I would, anyway. You see, he's a good man, but—he goes right on and does things without letting me know. Buys horses and things and mortgages them, and somehow doesn't pay for them.

"If he'd only tell me.

"So that we could talk it over, seems to me we might get along better. I expect the farm will have to go pretty soon. The man that has the mortgage says he can't wait much longer. You couldn't blame him; we haven't kept the interest up for a good many years.

"And just yesterday he came home from an auction with a lot more of old bobsleds. I don't know what he is going to do with them.

"If he had only told me he was thinking of getting them, maybe I could have said something to make him see it was no use. But he didn't.

"He never does. He thinks women don't know anything about such things. I know I don't understand all about business, but I would like to know."

"And so—"

"Well, do you really think a woman's head ought to be bothered with such things, 'Squire? Honest, now."

The man leaned forward and looked expectantly into the face of the man of the law.

"I'll tell you what I do think. If I were you and had a wife as good and as kind and sensible as yours is, I should want her to counsel with me on all matters of business. Don't you think she has a right to do so?

"She is your partner in life. You made her so when you married her. You have not made her so in fact. She has not been given her share of the burden to bear, and she ought, to take her half of the load. Why don't you let her?

"Now, I'll tell you what I would advise you to do. Not separate, but get closer together.

"Give your wife what she wants with all her heart—her fair share of the load to bear. Talk things over with her. Let her be really a partner to you.

"Don't buy bobsleds and old horses without letting her know about it.

"I know there is a temptation to bid on such things when we get a bit interested. Hold still when you feel that fire in your heart. Think of Mary and keep still."

"Do you suppose I can do it, 'Squire?"

"Of course you can, Sam! I'll go with you and stay right by you if you'll let me."

And the 'Squire did not write the letters of separation. Another document was written in the book of hearts of that man and woman. Just such a document should be signed, sealed and delivered between every man and wife in all this land.

The Use of Stable Manure.

It is a well known fact that no system of crop rotation will restore to the soil the potash and phosphoric acid removed by crops. Unless these elements that are removed be returned in some manner the soil will inevitably become too poor for a very ambitious man to cultivate. Common stable manure is conceded to be one of the best fertilizers for general purposes, and it is to be deplored that much of this valuable plant food be dumped away as so much trash, or exposed to the leaching rains even when intended for use. If it can make poor soil rich it can certainly maintain the fertility of rich soil. It is not insisted that the use of it would be advisable in all cases, since the fertility of the soil and crop to be raised should be the governing factors, but it is safe to assert that all stable manure can advantageously be used in any general farming community.—H. B. Fishburn.

VALUE $325.00

MAGNIFICENT PIANO

—AND—

$100.00 in Cash

GIVEN AWAY ABSOLUTELY FREE

FOR CORRECT ANSWERS IN THIS PUZZLE CONTEST.

1st PRIZE.— MAGNIFICENT UPRIGHT PIANO AND STOOL TO MATCH. VALUE $325.00.
Finest action and tone, beautiful hand polished Spanish mahogany case. Fit for the home of a King and the greatest prize ever offered in a contest of this kind. (It is on view any business day from 9 to 5 at our factory.)

2nd Prize	$25.00 cash
3rd Prize	$15.00 cash
4th Prize	$10.00 cash
5th to 9th, 5 Prizes of $5.00 each	$25.00 in cash
and 25 prizes of $1.00 each	$25.00 in cash
TOTAL CASH PRIZES	$100.00

THE PUZZLE.

GEPNINIW ORTONOT
NOTRAELM XFAILAH

The jumbled letters given above represent the names of 4 well-known Canadian Cities. To help you solve them we have underlined the first letter in each name.

The first is Winnipeg, now guess the rest and send us your solution of all four names in your very neatest and best handwriting.

CONDITIONS:
1. This contest is absolutely free. No one is asked to spend a cent to enter.
2. Children under 12 years of age will not be permitted to enter.
3. No employee of ours or relation of employee will be allowed to compete.
4. The prizes in the contest are awarded according to handwriting and general neatness. Be neat and you may win a good prize.
5. Judging will be done by three gentlemen having absolutely no connection with this firm. Their decision is to be accepted as final.
6. There is a simple condition to be fulfilled which we ask of all contestants. As soon as your answer is received we will write advising you if it is correct and telling you of this condition.

Address INTERNATIONAL MANUFACTURING COMPANY, Dept. 25 TORONTO, ONT.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

FOR SALE—Shorthorn bulls WALTER EATON, Upper Canard, Kings Co., N S

WANTED pork, dressed poultry, pigeons, eggs, rabbits, etc., fresh stock. Prompt returns. JOHN HOPKINS, established 1867, St. John, N B.

FOR SALE—Clydesdale Stallion, Kings College, 8 years old, imported from Scotland in 1907. Apply to R. M. MENZIE, Midland, N. B.

FOR SALE—Pure Bred Clydesdale Stallion, rising 3 years, great grandson of "Baron's Pride." Apply to F. E. SHARP, Midland, Kings Co., N. B.

FOR SALE.—Three pure bred Jersey bulls, one year to fourteen months. Sired by imported Fereor. A few young heifers. Write H. S. PIPES & SONS, Amherst, N. S.

FOR SALE, going out of business. 25 registered Cotswold ewes, all served with a first class ram. Aso a few rams. Prices right. DONALD INNES, Tobique River, Victorir Co., N. B.

WANTED—Ladies to do plain and light sewing at home, whole or spare time; good pay; work sent any distance, charges prepaid; send stamp for particulars. NATIONAL MANUFACTURING COMPANY, Montreal.

FOR SALE—1 Holstein Bull, four years; 1 Holstein Bull Calf, seven months; 1 Holstein Bull Calf, eight months. Dams records 13000 pounds. No better stock. Write for prices.—D. R. NICHOLSON, Coxheath, N. S.

ALL kinds of books on Poultry, Pigeons, Rabbits, Pheasants, Horses, Cattle, Farming, Gardening, Bees, Fruits, Flowers, Vegetables, etc. Catalogue free.—MORGANS POULTRY SUPPLY HOUSE, London, Ont.

Animal Individuality.

Men will forget that there is such a thing as quality in stock or poultry or at least seem to undervalue it. A hen that is sub-standard in shape and color cannot be expected to produce show birds. I have known farmers to start out to find out which was the better of two breeds of hogs by raising a litter of each together. Maybe one sow might weigh about five hundred pounds and be chucked full of quality. The other sow might weigh less than two hundred and be scrubby in every way. Nevertheless the farmer performs his experiment and is satisfied.

Would a heifer from a cow that produced six quarts a day be likely to make as good a dairy cow as the daughter of a twenty-four quart cow? A farmer once visited a famous herd of hogs. He did not seem to appreciate what made these hogs valuable and asked why his hogs were not worth as much. The breeder replied that it was in their individuality. The farmer turned up his nose at this as would a great many other farmers. But the individuality is all there is to an animal to commend him. The selection of these good animals is what has brought flocks and herds up to their present high standard. Your esteem for this matter of individuality will not determine the value of your flocks and herds and the size of your profits.—E. J. Reed.

Winter Care of Sheep.

With many farmers the sheep are much neglected in winter. One reason for this is that sheep will live with but little attention, but while they may live they come through the winter in poor shape and the ewes are not in condition to care for their lambs even if they do get liberal feeding after the lambs come.

The most frequent cause of ewes not owning their lambs is that they have been neglected through the winter, they are certainly run down and have no milk for them and what use has a ewe with a lamb when she has no milk for it.

The fleece of a neglected sheep is also light and of poor quality. If it pays to keep sheep at all it certainly pays to keep them well. Then another point in sheep feeding is that sheep should have a ration suited to their nature. While most of the food should be of a bulky nature it should furnish plenty of both protein and of mineral matter. The fleece requires a large amount of protein and of potash to grow it as it is largely made up of these substances. Some corn, oats and wheat bran can be fed to advantage to the sheep. Pea straw and clover are both good feeds for sheep but probably there is no other farm animal that will respond as readily to some green pasture such as early sown rye or winter oats. When these are not available such vegetables as turnips and mangles can be fed to advantage to the sheep.—Shepherd.

Annapolis Valley Fruit Farm

A most wonderful bargain, near depot, neighbors and school, rich fields, wire fenced, gentle southern slope to water front which it borders for 800 feet; splendid boating, bathing and fishing; 20 acres; orchard of 350 fine trees, 1 1-2 acres berries, 2 story, 10 room painted house, good barn, carriage and tool shed; grand view of beautiful orchards; to settle affairs quickly the price is only $2900, half cash including cow, pigs and long list valuable farming tools. C. H. WISENER,
Pictou, N. S.

LET US SHOW YOU HOW EASILY YOU AND YOUR NEIGHBORS CAN HAVE A TELEPHONE SYSTEM OF YOUR OWN

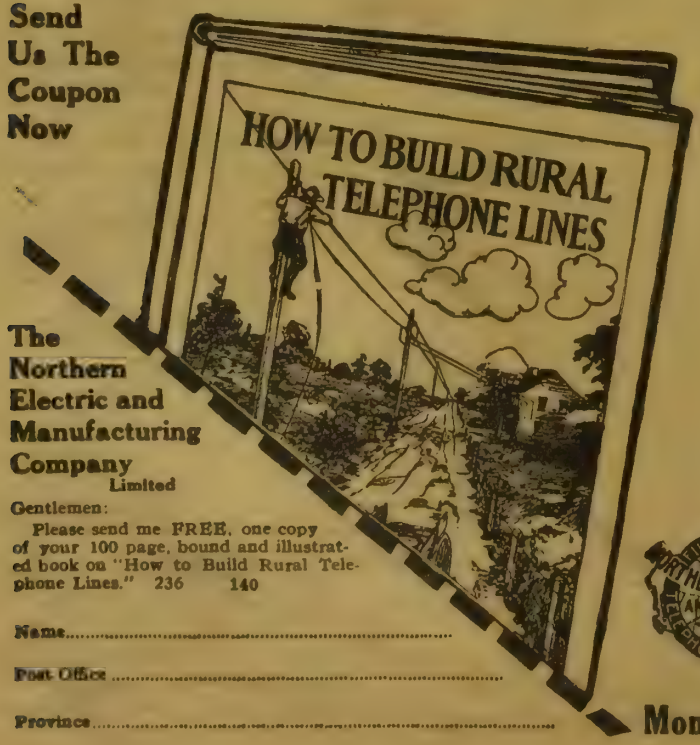
YOU—you and your neighbors—would have a telephone system for your own community, if you only realized how easily you yourselves could construct it and get it going. If you knew, in detail, how you and the people around you could form, own and control a local, self-maintaining company, for your own use and convenience, you would have such a system. There would be a telephone system in your community to-day if you knew how easily you and your neighbors could build every foot of the line and install every instrument yourselves—and especially if you realized that you do not need very much capital to do it either. Now, there is no reason why you should not know all these facts; for we stand ready to give you, for the mere asking, every bit of this information, provided only that you are sufficiently interested in the subject to write and ask us for it.

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

We Send This Book FREE But Only On Request

"HOW to Build Rural Telephone Lines," is an illustrated, cloth bound book of one hundred pages, full of a carefully indexed mass of information on rural telephones. This book tells everything ; with it before you, you can organize your own company and construct your own line. It tells you absolutely everything you need to know, step by step, as you go along. There is no other book in existence that deals so thoroughly with every vital, essential fact. Remember, this book has cost a lot of money and careful study to prepare. We really ought to charge for it. However, we send it free on request—but ONLY on request. To get it you have to send us the coupon and thus signify that you are really interested. The book is too valuable to distribute haphazard.

Send Us The Coupon Now



The Northern Electric and Manufacturing Company Limited

Gentlemen:

Please send me FREE, one copy of your 100 page, bound and illustrated book on "How to Build Rural Telephone Lines." 236 140

Name.....

Post Office.....

Province.....

We Will Explain All About Rural Company Organization

YOU do not need experience to organize a telephone company in your own community, when you have our book. It tells you exactly what you have to do and how to do it. All you need to do is to follow the instructions that the book gives and then get out and interest your neighbors. Whether you want to organize a mutual or a stock company, the book will tell you how.

You And Just Your Own Friends Can Build Every Foot Of Line

BUILDING your own line keeps down construction costs. With the help we give you, you do not need to employ expert linemen. The book explains the last word in line construction and contains, in this one chapter alone, thirty-seven diagrams and illustrations, showing how to make every kind of connection necessary, how to route the line, how to put the fittings on the poles, how to guy the poles, how to place the insulators and string the wires—in fact, how to handle every detail as well as an expert lineman can. On request, we will also tell you of your provincial regulations, what your government requires and what it will do to help you.

The Cost To Operate Your Own Line is Low

YOU can readily understand that when you and your friends have the entire management in your own hands, you can regulate the cost of running the line. In the book we explain just exactly what is necessary and you can take your pencil and figure out how little it will cost you to have a telephone on the wall in your own house.

Let Us Explain To You How To Interest Your Neighbors

THE first step in getting started, is to enthuse your neighbors and get them all in with you. When you have read "How to Build Rural Telephone Lines," you will have a mass of information at your finger ends that will enable you to place positive, definite facts before your friends, to enthuse them with the idea of a self-maintaining, community-owned system and to make everybody around you anxious to help. All it needs to get a telephone system started, is for some one progressive man to start the ball rolling. With the information that we will place at your command, you can get everything organized in short order.

There Will Be A Telephone System In Your Locality — Get Posted

SOONER or later someone is going to start a telephone system in your community, just as systems are being started every day in farming centres throughout the Dominion. When this subject comes up, you will want the full particulars before you. Now is the time for you to post yourself. The book tells you everything and, if you are interested, we will be glad to send it to you free. Do you care to sign the coupon and send it to us now?

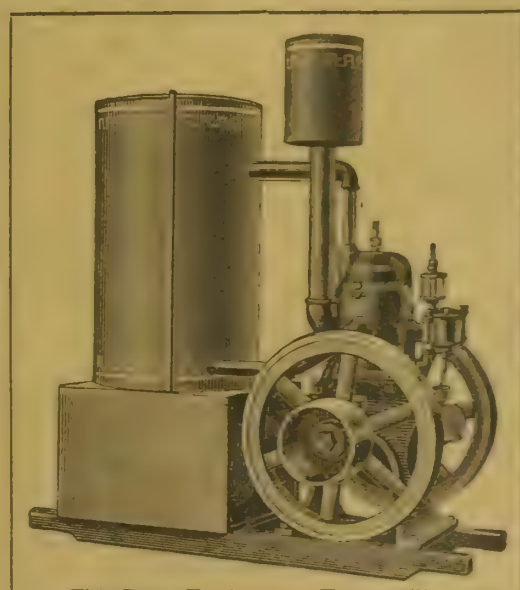
Page Work Engines

Since our first advertisement appeared a month or so ago giving particulars and prices of our engines, we have had many orders. People seem to readily realize that they cannot afford to go without an engine at prices we make—a 3 1-2 horse power at $138. or a six horse power engine for $188. The engines use for fuel either gasoline or kerosene. These engines are powerful but light and can be carried from place to place where work is to be done.

You may be wishing you had an engine to help you do your work, but may be unfamiliar with engines and have an idea that a gasoline engine is an uncertain, complicated thing. If you think so your fears are groundless, for gasoline engines are so developed nowadays as to be just as reliable as any other machine. Anyone can operate a gasoline engine, as there is no danger. No engineer is needed. There is nothing to blow up. Simply put gasoline or kerosene in the fuel tank and give the fly wheel a turn and away she goes for all day. Go off and leave it if you want to. It is safe.

A gasoline engine is started instantly. You do not have to wait to get up steam. When you are through work stop the engine and, and consumption of fuel stops at once. Hence, you can run the engine for only ten minutes, and you use only the fuel required for operating it that length of time.

As to cost of fuel, a Page engine uses only 7-8 of a pint of gasoline or kerosene per horse power per hour. Hence, if you were operating our 3 1-2—4 horse power it would use less than 1-2 gallon per hour, which at 15c per gallon would cost you only about 7 1-2c per hour. Probably you would not work the engine to its limit and fuel would be less accordingly, for a gasoline engine uses fuel only in proportion to the work it is doing.



This Page Engine on a Farm will pump, saw wood, run a cream separator, washing machine, churn, silage cutter, fanning mill, root cutter, grindstone, etc. It may be easily moved from one place to another, and is always ready to run. It does the laborious and tedious chores of the farm.

We are getting many orders from the Maritime Provinces, especially from Prince Edward Island, although Nova Scotia and New Brunswick are not far behind. Dealers find the Page engines a good line to handle as they are so low in price and so high in quality. We are getting so many applications for agency that we hope to have a thorough organization in the engine branch of our business in the near future.

Marine Engines

We have in above referred particularly to stationary or work engines. But we are also supplying marine engines from 2 to 36 horse power. Catalogue of either style on request.

The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

DE LAVAL Cream and Butter Triumph as Usual at National Dairy Show

Cream and butter produced through the use of DE LAVAL CREAM SEPARATORS made the usual clean sweep of all Highest Awards at the great 1911 National Dairy Show (including the annual convention of the National Buttermakers Association) held in Chicago, October 26th—November 4th, just as has always been the case since the organization of the National Association in 1892.

WHOLE MILK CREAMERY BUTTER

The sweepstakes or highest award in this class was won by A. J. Anderson, Otisco, Minn., with a score of 97.50, who says: "I have been using De Laval Separators for ten years and would not think of using any other."

FARM SEPARATOR BUTTER

The sweepstakes in the gathered cream factory made butter class was won by R. O. Brye, of the Readstown Creamery Co., Readstown, Wis., with a score of 97.33, this prize winner butter being made from the cream of farm patrons using De Laval Separators exclusively.

Mr. Brye says: "I was raised on a dairy farm, where my father used a De Laval Separator, and my own separator experience covers a period of twenty years. I have found the De Laval machines everything that is claimed for them."

HIGHEST PRIZE CREAM EXHIBIT

The highest award for cream was made to Nichols Bros., Bloomfield, Ky., with a score of 98.80, who say: If we didn't use the best separator we could not have made this record. Our experience has proved the De Laval the only separator that 'delivered the goods'."

DE LAVAL PRODUCTS ALWAYS SUPERIOR

Would-be competitors are naturally forced to make many claims for their separators. But the superiority of De Laval cream and butter, as evidence by the winning of all highest prize awards the world over for twenty years, is something so overwhelming as to be indisputable and unanswerable even by the most reckless would-be competitor.

Is Your Home Protected From Lightning?

This matter of lightning rods should be a personal one with you.

Is your home protected?

If not, can you afford to take the chances of its destruction?

You may have been spared up to this time, but give it a moment's thought and see whether it has not been through your good fortune rather than through your good management.

You have no assurance that lightning will continue to spare you.

It has visited your neighbors. Your turn may come next. If it should visit your home it means certain destruction of property. It **may** mean sudden death to you or to some member of your family.

You cannot shift the responsibility. It is a matter for you to decide. Face the issue squarely, and ask yourself the question whether you are playing the part of the prudent man in neglecting to guard your home and dear ones from the lightning stroke which may come at any time.

You have the highest assurance that can be given that the Dodd & Struthers System of lightning rods does give protection.

It is a reasonable system. The demonstrations put its effectiveness beyond question.

The position that the insurance companies have taken in the matter should have great weight with you.

Their interests are to preserve property. They have no personal interests in Dodd & Struthers.

Your interests are the same. You want to preserve your property—and your life and the lives of your family.

The insurance companies are encouraging you and making it an object to you to protect your property. The reduced rates of insurance you receive will soon pay for the lightning rods so that in effect you have home and family protected without cost.

But the insurance companies cannot force you to act. It is a question for you and a question of NOW.

After awhile may be too late. Will you answer the question in your own best interest?

All information will be supplied by writing to

DODD & STRUTHERS, Sherbrooke, Que.

Natural Physics and Lightning.

Protection of Farm Buildings

By Professor West Dodd.

Not Protected and Protected.
In the Grip of the Storm—One is Taken and the Other is Left.

WHAT is lightning, and what is electricity? With a great deal of experiment and much study the civilized world has acquired a little knowledge of electricity, and that knowledge has added greatly to the happiness of mankind; for, by it we are able to sit in our parlors and talk to our friends hundreds of miles away, and by it we can light our streets and homes, and the electric railways are already performing feats impossible for steam systems.

But this mysterious, obedient servant to man, when it manifests itself in a thunder storm, is one of most terrifying and destructive forces known. And on this occasion we are to discuss electricity in its relation to lightning, the laws by which it operates and the means by which we can govern it.

If you should ask me the question, "What is lightning? I should say, "An electric explosion."

But that might not satisfy you and you would come back at me and ask.

"What is Electricity?" I should be compelled to say, "Electricity is one of the nine forms of Energy," That brings you to the main question, and you fire it at me and ask "What is Energy?" and here you corner me and force me to say, "I don't know."

But this much I do know: I know it was here when I came. By it I live, move and think, and when I am gone it will still be here.

But I know something more about energy.

I know it is indestructable. That we can neither destroy any of it, nor can we create any more.

If I am rightly informed, the patent office at Washington has to maintain a special clerk whose duties are to look after perpetual motion cranks—men who imagine they can make a machine that will create energy, and run without other power.

But it is just as impossible to destroy energy at it is to create it.

Energy has nine different forms in which it can exist. Light is one of these forms, heat is one, and electrical energy is another they are all different, all alike mysterious, and all are interchangeable—that is, we can change heat into electricity and electricity back into heat, etc.

A photograph showing a wide sphere of influence.

If we have a given quantity of heat, we can change it into a certain measure of mechanical energy and drive an engine with it. And the engine power can be changed into electrical energy by passing it through a dynamo, and the electrical energy can be changed back to light or heat or mechanical power.

The changing of energy from one form to another is called its transmutation.

The names of these nine forms of Energy are "Heat Energy," "Radiant Energy," "Chemical Energy," "Cohesion Energy," "Magnetic Energy," "Kinetic Energy," "Gravitation Energy," "Energy of Elasticity," and "Electrical Energy."

ONLY ONE ENERGY.

Do not misconstrue this and think these are nine different energies. The nine are different forms of one energy, not different energies.

Here is another most important fact about Energy. It can be stored up for millions of years and then takeu out and used.

To illustrate: If you wind up a clock spring, you transfer energy from your arm to the spring and a little racket wheel, with trigger locks it up in the spring. Then there is a constant strain on the spring which will drive the clock's pendulum for a week, and when the energy has all gone out of the spring, the clock stops.

Now all of nature is wound up just like the clock spring, ready to do work as it runs down.

A storage battery has energy put into it which puts a strain on its atoms. When electric energy is coming from the battery the atoms of the battery are being relieved of their strain and are coming back to their natural condition, and when this is accomplished the battery is run down and will not give out any more electricity till more energy is put into it, or till it is wound up.

A piece of coal is stored-up energy, just like a storage battery or a wound-up spring, and is capable of driving our railroad trains as its energy is released.

When conditions are right energy makes combination with matter and stores itself up in chemical affinity and cohesion. In this manner energy is stored up in coal.

WHAT CHEMISTRY TEACHES

The science of Chemistry teaches us that all matter, solids, gases, liquids, is made up of minute grains called atoms. They are the bricks of the Universe, out of which we and the Solar System and the Milky Way are made.

Locked up in these atoms is the cause of the heat of the sun, the nature of the electricity and the evolution of worlds.

Heat energy is a form of motion among these atoms. This motion arranges the

In the hush before the storm breaks—Grand but terrible.

atoms in a fixed relation to each other—winds them up into molecules and cells. Not only electricity, with all its phenomena, but every action of every thing, living or dead, is due to motion among these atoms.

Millions of years ago the energy of the sun's heat, acting on the atoms of the earth and air, set up a vigorous motion among them by which they made combinations and were locked together and build up vegetation.

When that vegetation was forming, the energy of heat was changing into chemical energy and held in mass by cohesion.

The heat energy of the sun was in this way transmuted and stored up in chemical affinity in the rank vegetation of by-gone ages. For millions of years it has been lying under great geological strata, and now in the year 1912, A.D., we dig through this geological strata, and take out that ancient vegetation in the form of coal. We release that same old sun energy from that coal and make it drive our railroad trains and our electric trains and run our factories and warm our homes and make our light.

Let us trace this energy released from coal in the form of heat in kinetic or mechanical energy in the steam engine, and from there into the dynamo, where it changes into electrical energy, and then through the electric motor, where it changes back again to mechanical energy and drives the cars. This will give you a better comprehension of electricity, and, incidentally, of lightning.

When coal is burning it is like a wound-up spring running down, or a storage battery giving up its energy, only in the coal the energy comes out in heat form.

When this heat passes into water in the steam boiler the water molecules become agitated, and when the temperature reaches 212 degrees Fahr. the agitation is sufficient to overcome the cohesion of the molecules, and it becomes steam and needs more room.

You have noticed railway engines when standing still suddenly blow off steam; that means the steam pressure is sufficiently great to lift a safety valve, and the steam escapes and prevents an explosion.

But when the engine is at work the steam pressure in escaping drives a piston back and forth in a cylinder, and this drives the engine and gives us mechanical energy.

If we belt the engine to a dynamo, the mechanical energy of the engine is changed to electrical energy in the dynamo, and when energy is in the electrical form, it will travel through wires or conductors to where you may want to use it. You can change it into light or heat, or into mechanical power again and drive the cars with it.

ELECTRIC MOTOR AN ACCIDENTAL DISCOVERY.

It may be interesting to you to tell you the story of the discovery of the electric motor.

It was Michael Faraday, an Englishman, who about the year 1812, invented the induction coil, which made the telegraph and the telephone possible, which made the dynamo and the electric motor possible, and opened the door for our great evolution of scientific achievement.

Mr. Farraday knew that energy had nine ways of appearing. He knew that electricity was one of the nine, and he knew these nine forms were interchangeable.

That is, he knew that heat could be changed into mechanical energy and made to do work or be changed into electricity or any of the other forms of energy, and he knew there must be a way to change electricity into mechanical power.

He did not know how to do it, but he prophesied some philosopher would discover the method. Mr. Farraday was correct in his prophecy, but the discovery was made by a blunder. Farraday's induction coil had been developed into the dynamo, and we had electric lights in all parts of the civilized world before we had electric power.

I think it was Vienna, Austria, where the blunder was made that resulted in the discovery of electric power, and it came in this way:

In a little electric light plant there were two dynamos. One moonlight night the superintendent thought one dynamo would do the work and the other could stand idle. He sent a green workman to switch in the dynamo. The "greeny" found a loose wire in the dynamo he was to use, and he connected it to the dynamo he was not to use, and when he switched in dynamo No. 1 both dynamos started; but No. 2 was going backward.

A Destructive Lightning Bolt.

Here was a revelation! Connect a live dynamo to a dead one in a certain way and the dead one will spring into action and give out power.

Farraday's prophecy was fulfilled.

A shrewd scientific man said: "I can make electric energy into mechanical energy, the same as heat, and drive the cars.

"I will build a rail track and put a car on it; then I will take a dead dynamo and put it under the car and gear it to the car axle. Now all I need is a wire to connect my dead dynamo to a live one, and when it goes the car will go.

"So I will have a power house in any convenient spot and a dynamo there driven by the engine. This dynamo will change the engine power into electricity.

"Then I will connect a wire to this dynamo, and bring it over the rail track on poles, and I will run an electric conductor from the dead dynamo under the car and carry it up over the car, put a trolley wheel on it, and let it touch the wire over the track, and this will connect the two dynamos."

When he did this, away went the car.

TREMENDOUS ENERGY IN WATER

Now at the instant when energy changes from one form into another, there is a tremendous strain thrown on or released in the atoms of matter, and if this strain is confined too much there will be an explosion. There is a way by which we can determine the mechanical or explosive force of different forms of energy. And no matter where the explosion may be it always results from a strain on the atoms.

For instance, if you had 1 lb. of water and should raise its temperature one degree, the amount of energy is equal to the energy developed by 1 lb. of lead falling over a precipice 722 feet. And 100 degrees rise in temperature in 1 lb. of water develops the same energy as 100 lbs. of lead falling 722 feet. And if you brought your 1 lb. of water to the boiling point and had it confined you would develop energy enough to have an explosion, and the same principle holds true in the lightning explosion.

Before I tell you how electric energy gets into a cloud and how the explosions occur, let me tell you how much energy can be stored up in some things.

There is enough energy stored up in a cubic foot of coal to lift 3,660 tons one hundred feet high.

An automobile goes thundering by, driven by the energy released from a few drops of gasoline.

A thimbleful of powder will blow a bullet twenty times its own weight for a distance of two miles. There is more energy stored in coal than there is an equal amount of powder or dynamite, but powder and dynamite give up their energy all at once, and that makes the explosion, while coal gives up its energy slowly and uniformly, and we can use it for work or heat.

There is more energy stored up in a thimbleful of seed than there is in a thimbleful of powder, for, while a thimbleful of powder will throw a bullet twenty times its own weight two miles, a bird may fly to-day one hundred miles on the energy it extracted from the thimbleful of wheat it swallowed yesterday. 6

According to Tyndall, the amount of energy locked up in oxygen and hydrogen, the two gases which are combined to form water, is simply amazing.

Eight pounds of oxygen and one pound of hydrogen, properly combined, will give you nine pounds of water vapor.

The strain on the atoms is released as soon as these gases combine to form water, and the amount of energy released in making this nine pounds of vapor is enough to lift 48,000,000 pounds one foot high, or, if conserved for explosion, would blow a ton of lead four and a half miles high.

But when this nine pounds of vapor is condensed into water, still more energy is released, and this time enough to lift a ton one-half mile high.

But there is still more energy left in the water, and when we reduce it to nine pounds of ice out comes the balance of the energy, and this time there is enough to lift one ton 433 feet high.

So, if Professor Tyndall is correct, our nine pounds of oxygen and hydrogen interchanging to vapor, water and ice, give up enough energy to equal that of a ton weight falling five miles from the sky.

I have stood at the base of Niagara Falls and have seen a mighty river falling over a precipice 160 feet with a vehemence that shook the very earth. Yet to produce from its constituent gases a quantity of snow which a child could carry demands an exertion of energy sufficient to lift the whole of that mighty river back up over the precipice and drive it back into Lake Erie.

With this conception of the amount of energy that can be stored up in such a small quantity of matter, we are less surprised at the grand outburst of power released at the birth of a lightning flash.

HOW LIGHTNING FORMS.

And now let us turn to lightning and see, if we can, why life and property are endangered by it, and what we must do to secure safety in our homes. First, let me tell you how Electric Energy collects in a cloud, for, before any lightning appears, something is going on in the clouds.

The sunbeam is the prime cause.

The cloud does not gather electricity out of the air, as many people imagine. The Electric Energy in a cloud is due to sun heat which brings about rapid evaporation of water.

Remember that heat is one of the nine forms of energy, and when evaporation of water takes place the sun heat that caused the evaporation changes into one of the other forms of energy. The little globules float away, each carrying its own little quantity of "energy" or "strain" on its surface and when the countless billions of these energized, invisible globules rise to the sky, where the cold of elevation rapidly condenses released in the form of electricity, them into raindrops, this energy is ready to give back the energy of the sun condensed into lightning flashes.

Here is an interesting little experiment that will help you to realize how heat changes into some other forms of energy when evaporation takes place.

Lift a kettle of boiling water from the fire. You can set the kettle on your naked hand and it will not burn you. If the kettle is nearly full it will continue to boil for five seconds after you lift it from the stove, which will give you time to carry it sitting on your naked hand across the room. But when it ceases to evaporate or pour out steam, it will begin to burn you.

This test shows how heat vanishes when evaporation begins. In this manner the energy of sun heat is transmitted when water is evaporated and reappears in the form of electricity when condensation takes place in the sky.

Now let us see just how the flash of lightning is made.

Your philosophies tell you, "Before a house is struck with lightning, the house is first charged by induction." Now that word induction is too big.

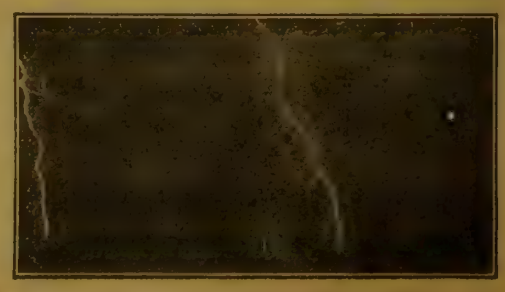
Induction is taken from the word "induce," and induce means to coax or pull your way."

So your philosophies try to teach you this: "Before a house is struck by lightning an electric strain is placed upon it." That is, a condition has been coaxed into it, and it is this condition we have to deal with if we would prevent it from bursting into a lightning explosion.

But if a fog extended from the cloud to the earth, this condition would not exist, as the electricity easily reaches earth through the fog and makes no lightning.

You will remember you never saw lightning on a foggy day, but when the air is dry the earth directly beneath the charged cloud is electrified in sympathy with the cloud and tries to discharge to the cloud the same as the cloud tries to discharge to it, and a great electrical strain is between the cloud and the earth.

Now the air is a poor conductor of electricity, and things that stick up from the earth into the air, like houses and barns, become discharging



You expect a deafeningclap of thunder to follow this.

points for the earth's electricity, and in this way the house gets ready to be struck.

So the lesson we wish to impress here is this: Lightning is due to causes. Electricity first gets in its work and loads up a cloud. Then this cloud fixes up things on the earth and induces an opposite electric condition, and the two electrified surfaces strain and pull on each other, and when the strain gets great enough so that the air cannot resist any longer, off she goes with an explosion through the house, and the undertaker has a job on his hands.

SAFETY AND DANGER ZONES.

Having shown as clearly as possible in so short a time the cause of lightning and how the flash is brought about, let us consider briefly the remedy or how the stroke may be averted.

Let us begin by calling to mind that there are some things lightning will not strike,

There is a reason for it.

"Chance" is not known in the operation of nature's forces.

There is no safer place on earth from lightning than in a steam engine or in a railroad coach. No one was ever known to be injured by lightning when in a railway train.

Lightning will not strike a building if its sides and roof are covered with metal.

Lightning will not strike the business part of a big city. The tall skyscrapers, of our large cities are immune from lightning, and insurance companies never have any losses from lightning on any building with metallic sides and frame work of iron or steel.

Lightning will not strike a modern battleship on account of the material of which it is constructed, and a steel windmill tower is never injured by lightning.

There is a reason. Every one of these things is its own lightning rod. They need no further protection.

But there are things that lightning will strike.

Lightning will strike a country home, or a home in the suburban part of the city.

Lightning will strike a barn or a church or a school house or a tree or a stack or an animal, especially if near a wire fence. All of the lightning losses our insurance companies have to pay are on this class of risks, and a man has to be blind almost purposely not to see room for thought in these observations.

When energy is given up slowly it is useful. When it is given up instantly, it is destructive, and we have an explosion. Lightning is an explosion, an electrical explosion. Electricity is not lightning, but is ready to change into lightning and smash things if we let it.

ELECTRICITY CONTROLLED BY KNOWN LAWS.

There is nothing known which is so responsive to law as electricity. Indeed it is the only thing you can send round the world in the twinkling of an eye. It is the most obedient servant or the most cruel master, according as we are intelligent with it or ignorant of its ways.

Note this law: "Through some things electricity passes easily; through some things it does not." When electricity passes through an easy road the effect is very different from what it is in passing through a hard road.

If electricity passes through metal, that is an easy road, a good conductor, and there is no heat or lightning on the conductor.

If electricity passes through the air, that is a poor conductor, and because it resists energy in the electric form, heat and mechanical violence are generated, and you say lightning. Anything that resists electricity will either get hot or fly to pieces, or both.

As an example: We have here the electric lights in this room. Now if I should ask any of you if these electric lights came through the electric wires, you would promptly answer, "No, the light does not come through the wire. If it did, the wires would be covered with fire; but the electricity comes through the wire, and there is light only in the lamps."

The answer would be correct. The reason is this: The wires are good conductors of electricity, and offer so little resistance that very little heat is generated in the wires; but in the lamp is a filament of cellulose, which is a poor conductor of electricity—a little loop—it looks like a black thread; you know what I mean: Now when the electricity comes to this loop, it meets with great resistance, and has now a hard road to pass through, and on account of this resistance the loop in the lamp gets white hot, and you say, "Electric Light." So you see, if the filament in the lamp was as good a conductor as the wire outside the lamp, there would be no electric light.

I think you see what I mean when I tell you electricity has a different effect when it passes through a good conductor from what it has in passing through a poor one; and when I tell you that lightning no more goes through a lightning rod than the electric light goes through the electric wires, it begins to look intelligent to you.

Nature seeks the path of least resistance between the cloud and the earth, and in this path the lightning flash is to appear.

When the path of least resistance has been established, the atoms and molecules along this path and near to it are put under a tremendous strain, and when that strain reaches a certain tension, there is an explosion along the whole line, and we say "Lightning."

HOW LIGHTNING RODS PROTECT.

That brings us to the scientific use and purpose of the lightning rod. Namely, to cause the electric energy in the earth and building to pass off into the air gradually, to prevent "charging," to relieve the stress in the building, and thus to avoid the sudden explosion or the lightning "stroke."

The railroad trains, high steel buildings, steel windmill towers, etc., are themselves conductors of electricity, and therefore need no rods to disperse the electric energy and avoid lightning.

But in the case of ordinary houses, barns, churches and the likes, you are to learn the lesson that lightning rods and the sharp points that are placed upon their tops are not erected to "draw" lightning, but the thus avoid lightning by doing away with the conditions which produce very opposite. They quietly discharge electricity into the air and lightning.

There is absolutely no necessity for the present fearful destruction of life and property by lightning.

The prevention of lightning is a scientific accomplishment. But, being a scientific proposition, it must not be entrusted to unscientific hands.

If you had appendicitis, I think, maybe, I could cut off your appendix, but somehow or other I think you would die afterwards. You would show better judgment if you got a man who understood that business to do that kind of a job. And that is exactly the situation in the lightning rod business to-day.

There is no set of fixed rules that will apply to all buildings, and what would protect one building will not protect another.

The material of a lightning rod and its size are of far less importance than the system of putting it on.

You know when steam pressure reaches a certain strain in the boiler, it lifts a valve, and the steam escapes, and that keeps the boiler from exploding. When electric strain reaches a high tension on a lightning rod the points act like a safety valve and relieve the strain, and this prevents the lightning stroke.

We need your help and you need ours. Give us a boost by joining the Maritime Sheep Breeders' Association.

We must know the philosophy of these things, but by far the most important thing is the skill necessary to protect a modern home from lightning. It is a serious mistake to think that any class of men can do this work, and it is unfortunate that ignorant and imcompetent men are allowed by law to engage in the lightning rod business.

The insurance companies, however, are rapidly lining up on the importance of this scientific profession, and many of them are ready to make reduced rates in farm insurance where the property is rodded in one way which squares with integrity and science.

Questions and Answers.

1.—What is the cause of lightning?

Atnospheric Electricity. The Atmosphere is a very poor conductor of Electricity and resists its passage, and on account of this resistance the road over which it discharges is made white hot. You see the white hot road and you call it lightning. Learn right here, Lightning is not Electricity, but explosion and fire, due to resistance. Remember the word "Resistance."

2.—If the air had not resisted the electricity, would there have been any lightning?

No, none whatever; electricity makes no fire disturbance or violence unless resisted.

3. Do all materials resist electricity alike?

No, metal of all kinds resists electricity very little, and is therefore called a good conductor. Wood offers much resistance, and is frequently shattered to pieces on that account. The atmosphere offers still more resistance, and in consequence is reduced to an intense white heat.

4.—Does metal attract lightning?

No, the question is not intelligent and is erronerous. It is an absurdity. Lightning is not flying around at random to be attracted by anything, but is the result of abnormal electric conditions. Read question and answer No. 1 again.

5.—What? Does not lightning go down electric rods into the ground?

Oh! No, no. Just stop and do a little thinking at this point. You have seen the electric light? Yes. Well, if I should ask you if the electric light runs along the electric wires, you would quickly answer; "No. If it did the wires would be covered with fire." You see, where electricity finds a good conductor, like the wires, it passes through without making light or heat, but in the electric lamp the thread-like filament is not a wire but a very poor electric conductor, and on account of this resistance the filament becomes white hot. From this you learn "Wherever there are good conductors for electricity to pass through, there is no fire, and a good lightning rod bears the same relation to a lightning flash that an electric wire does to an electric light. It lets the electric discharge find an easy way over the house rather than causing explosion and fire in the house for lack of a conductor." See!

6.—Are all things equally liable to be struck by lightning?

No, indeed. Some things lightning never strikes at all; other things it strikes quite frequently. This shows it is not an accident or a freak of nature but is subject to control and only requires intelligent management to render it harmless.

7.—What things are never struck by lightning?

This may surprise you. Lightning will not strike—A railroad train; Buildings covered with metal on sides and roof; Buildings with iron frame work throughout; Steel wind mill towers; Modern steel battleships; Business blocks in large cities, etc. What do you think of question No. 4 now? 6

8.—What are the things lightning will strike?

Imperfect conductors of electricity, such as—Country homes and barns; Three-fourths of our city surburban homes; School houses; churches; stacks and trees; Cattle and horses especially, if near wire fences. Do not these observations make you thoughtful, and show that chance is unknown in the operation of nature's laws.

9.—What is the cause of a house being struck by lightning?

This is an intelligent question. Let us be intelligent with it. To begin with get the truth well planted. "Before any lightning occurs, nature first prepares a class of conditions." Remember "Conditions." These conditions are the storage of electric energy. This accumulation of electricity is called a charge. It first collects in the cloud, and tries to discharge to earth, but the drier air beneath the cloud is a very poor conductor of electricity and resists the discharge, and the charge continues to increase. While this is going on in the cloud, the earth directly beneath the cloud becomes affected in sympathy with the cloud and becomes electrified too, only in an opposite condition, and the electric stress on earth pushes toward the cloud, the

A RECORD ATTENDANCE AT THE COLLEGE SHORT COURSES.

"I recently advised the Provincial cashier to forward you cheque in payment of account for advertising. You have certainly given us full returns for the money.

The attendance, 340 actually enrolled, is a record one for Nova Scotia and, I think, for Canada, and I have not the slightest doubt that the assistance which you lent us through the columns of your paper has assisted very materially in bringing about this very much desired state of affairs."

Thus reads a letter received recently by THE MARITIME from Prof. M. Cumming of the Nova Scotia Agricultural College.

Aside from the fact that we are always pleased to help along the progress of Agricultural education in Maritime Canada, we are also pleased to note, with no small degree of pride, that any efforts we may have put forth have borne fruit.

The N. S. A. C. is, however, so well known through the medium of its good works and the recommendations of its ex-students that as years go by the number of students enrolled at the various courses is steadily increasing. Students coming from various and widely scattered sections of Nova Scotia, New Brunswick and Prince Edward Island return home, at the close of the courses, filled with enthusiasm and love for their profession. Not a few cheerless agricultural prospects have beed brightened and encouraged by the influence of the N. S. A. C. Each and every member of its staff have the best interests of the community at heart. They belong to that class that knows not sect nor rank so far as dealing with the people they come in contact with is concerned. Any farmer, no matter what his station in life may be, will always be assured a cordial welcome whether he visits the college or meets the members of its faculty at any of the agricultural functions that radicate from the influence of the school.

Three hundred and forty is no small number. The seed sown in this case will undoubtedly, in the majority of cases bring forth the proverbial hundred fold. No one need say that agricultural interests are on the wane in Maritime Canada. They are very much alive and are going to live. The next decade will be that of the East and we will go forward until some of the older agricultural districts of Canada must look well to their laurels.

Let each and every man, woman and child in the Maritime Provinces make a long, strong, co-operative pull for a Maritime Agricultural College so that its present uplifting influence may be more fully realized throughout the highways and byways of our fair provinces, A larger college with more opportunity for original research work that would benefit everybody would result.

TRAINING FOR HOME BUILDING.

One reason so many people whose duty is to erect and maintain homes are not qualified for this important work is because they have had no training in home economies. There are many people who have had educational advantages wholly ignorant of the requirements and art of home making. It is one of the obvious defects of our educational system that the practical every-day affairs are neglected and stress placed upon many things of less practical importance. But it is encouraging to note that our schools are being improved and teachers directing their efforts more toward the practical side of life.

Parents should give their children suggestions upon home making and direct their attention to the importance of home art. It is especially desirable that young people attend farmers' institutes where lectures are given upon domestic science and home economies. Practical ideas can usually be obtained at these lectures and many young people get an inspiration for better home life.

Most of the agricultural colleges have short winter courses and some summer lectures upon home economies. A few weeks at the college is of much benefit to old as well as young people, since in addition to the lectures and demonstrations, one can learn something about equipment for the kitchen, the dining room and the furnishing of the home. Here information may be had about the water supply, heating, ventilation and sanatation and the cheapest and best methods of making the home attractive and comfortable.

All of our high schools and colleges should have courses in domeitic science, home economies and the elementary principles of laidscape gardening; pupils should be required to take these courses. Home life is important to the country as well as to individuals and schools that do not emphasize these features are not properly training our boys and girls for home building.

THE BOY'S CHOICE.

It is hard for a normal boy between the ages of, say, twelve and twenty, to realize that the school is the best place for him for about eight months out of the year. To him, farming looks to be a case of handling horses and machinery, and he feels that about all he needs to do that is a little more strength. He is not aware of the need of knowledge of business to help him take care of a farm's produce; he does not appreciate the value of a broad, general information to place him in the sphere he should occupy as a citizen; he generally rather scorns the learning of the art of correct speaking; in short, his physical nature is dominant, and he wants to work off his surplus energies.

This is what he should have a chance to do, but at the same time he may be directed into the getting of more out of school. A good deal depends upon setting up an ideal for the boy, or rather in helping him to establish an ideal that is worthy of his efforts. In most cases the minister, the school teacher, the store keeper or even the parent, is not the boy's ideal. Very often the man who runs a threshing outfit, or the engineer on a railroad, are the men he wants to be like.

When a boy has such ideals, the thing to do is to encourage him to be like these men, only to be more clever. Show him they have had to go to school, they have to figure and read, and that the one thing most of them regret is that they have not more education.

The youngest child has a way of asserting his rights in the choice of his ideal; let him have his choice and he will make it just as worthy as he is capable of becoming.

AN IMPORTANT QUESTION.

One of the most important matters now before the people of this country is the subject of good roads. Its importance lies in the direct bearing it has upon the social and economic welfare of the whole people. It is at the best of the great problem of transportation, that problem which is vital to the interest of all classes—producers, dealers and consumers.

The rural highway leads from every farm to every market, and over it passes annually the food supplies of the nation. The condition of our rural highways is not the sole concern of the man who lives upon them, but it is the concern of all. We should have the finest roads in this country that wise expenditure and trained engineering skill can produce. They will prove a source of national wealth, a bond of national unity, and a crown of social and intellectual advancement upon the ruddy brow of rural life.

Do not for the sake of the soil and those who will be dependent upon it after you, burn the weeds, stubble and vegetation. Turn under all of these materials and let them be converted into humus, which is so essential for the soil. Be progressive and not retrogressive.

* * *

There never was a time when economic feeding ment more to stockmen and farmers. Feed is too high to feed it in a careless manner.

Nova Scotia Farmers' Annual Convention

The Sixteenth Annual Meeting of the Nova Scotia Farmers' Association was held in the Y. M. C. A. Hall, Yarmouth, N. S., on Tuesday, Wednesday and Thursday, January 23rd, 24th and 25th.

The opening meeting took place on Tuesday evening at eight o'clock. The spacious hall was crowded to overflowing with representative delegates and the interested citizens of Yarmouth. On the platform, with President W. H. Woodworth, were the other officers of the Association, His Worship Mayor Kelly of Yarmouth, Prof. M. Cumming, Prof. J. H. Grisdale, Director Experimental Farms, Geo. H. Barr, Chief of the Dairy Division, Ottawa, W. T. Ritch, Sheep Commissioner, Mr. Churchill, President Yarmouth County Farmers' Association, S. A. Cook, Vice President Yarmouth Agricultural Society, H. W. Corning, M. P. P. and B. B. Law, M. P.

PRESIDENT'S ADDRESS.

To the Officers and Members of the Nova Scotia Farmers' Association.

Gentlemen,—

As President of this Association, it gives me great pleasure to extend to you a hearty welcome to this, the sixteenth annual convention. Meeting as it does for the first time in its history in the town and county of Yarmouth, a county that not many months ago paid a high tribute to Agriculture, by sending one of its prominent young farmers as their representative to the Legislative Halls of the Province.

Another year has passed since we last met and as farmers we have every reason to be thankful to the Giver of every good gift, for the bountiful harvest of the past season. The fruit growers of the Annapolis Valley have gathered in and are now marketing their largest and cleanest crop of apples ever harvested in this province, some 1,500,000 barrels. This large crop finds a ready and paying market in England, Scotland, the Canadian West, Africa and Newfoundland. The quality and flavor of the fruit cannot be excelled in the world. A large portion of this crop is handled through the Co-operative Companies. The weather during September and October was very fine and a little advertising brought an abundance of help from outside districts to gather the crop. To the Orchardist the drought of Spring and Summer was only a blessing in disguise, for it secured for him fruit free from fungus growth and also proved to those who carefully cultivated their soil that by conserving the moisture of early spring and keeping it under a dust mulch, that plants and trees can be made to flourish over a long period of dry weather. The absence of rain also encouraged the formation of fruit buds, and I am pleased to report that as far as fruit buds are concerned there is a fine show for a good crop next year.

The hay crop was not up to the average but in many sections of the Province large quantities of old hay was left over from last season which will help out the shortage this year. The large quantity of roots produced goes a long way to improve the conditions of our stock. The varied products of our farms continue to find a ready market at good prices, nevertheless the high prices have not up to the present stimulated the producers to supply enough to satisfy the demand of the consumers, and food products are being imported.

As yet there are large areas of land fit for cultivation in the Province remaining unimproved and the Census returns show that the towns and cities are increasing at a much greater ratio than the rural districts, showing that the people are flocking to the towns and cities at the expense of the country. This fact is one of the most depressing signs of our times. The only hope that we have of a permanent national prosperity is by every means to induce more people to become tillers of the soil and thus by becoming producers they will not only feed themselves but help to produce for the masses and thus reduce the high price of food. Reasons not very difficult to discover, yet exist, why our young men leave the farm. Land in the Agricultural districts is held at a very high price, and there is a desire rather to increase their holdings than to sell unoccupied lands or even to divide it among their boys.

Farming is not looked upon by a majority of our people as very noble or elevating and you can find but few mothers using their influence to induce their sons to follow farming, therefore by the natural conditions of things the boy gets educated off the farm rather than to it. The natural tendency of human beings, like the birds, is to live in company with their kind, and on account of the loneliness of the country life the young men seek the town or city for more social life. Men would rather almost starve in a town than dwell in the country with plenty.

Much has been done to make the country conditions more enjoyable. In many sections we have the Rural Mail Delivery, the Telephone and an abundance of valuable reading matter coming into our homes daily.

I remarked in a former paragraph of this address that prices were good, but if we would have them better we must combine and form Co-operative Societies, through which we can sell our products and buy our supplies, thus cutting out the speculator and the middleman.

In the past few years our farmers have learned many valuable lessons. Intensive farming instead of Extensive farming is the word, producing double the crop on an acre and having fewer acres under cultivation. By the use of leguminous crops and a proper rotation, supplying the soil with humus and encouraging bacterial action of the soil.

Our Provincial Exhibition has come and gone with its usual deficit. If fruit is to be successfully shown at Halifax it must be shown on or about October 10th. Local Exhibitions were a success both as to number of exhibits and attendance. The Fruit Show at Yarmouth was a great credit to the county.

The Maritime Winter Fair was a grand success and is steadily growing in public opinion. The Horse Show has far exceeded the hope of its promoters. Our College at Truro is doing good work and the attendance increasing each year, we hope in the near future to see a Dormitory erected of sufficient capacity to meet the needs of our boy students. We are glad to see so many of our young men attending our Agricultural College. They should be a great source of strength to our agricultural interests. The Short Course was well attended this year and is an excellent opportunity for those who cannot take the full course to get in touch with the up-to-date methods of modern farming.

Our Institute meetings have done very much in the past to help introduce modern methods among those who could not leave home. But in order to get the best out of the meetings some means must be devised to get the farmers generally, to attend. The more the farmer studies his business the more successful he will be. Lack of education is one of the greatest hindrances to progress.

We have gentlemen with us well qualified to address us on the subjects assigned to them and when we return to our homes let the inspiration of these meetings assist us to do better work on our farms.

I ask your assistance in conducting the meetings of the next two days and hope that every delegate will be in his place at the beginning and during every session.

ADDRESSES OF WELCOME.

His Worship Mayor Kelly on behalf of the citizens of Yarmouth extended a most cordial welcome to the delegates. He considered the delegation of the utmost importance to his county and town. He was glad to note the feeling of a better understanding between urban and rural citizens. Old time barriers and prejudices were being pulled down and it was to the farmers' efforts whether in delegation or in combination that the world must look for cheaper and better food.

President W. Churchill, of the Yarmouth County Farmers' Association, read the following address:

Mr. President, Members of the Nova Scotia Farmers' Association, Ladies and Gentlemen.

As President of the Yarmouth Co. Farmers' Association it affords me great pleasure to welcome you to our county, and to extend to you the cordial greetings of this Association numbering over four hundred members—an Association that has had an active influence in this county for many years. Although we have been so long waiting for your first meeting in this county, yet it is with feelings of appreciation and pride that we greet you to transact the business of your sixteenth Annual Session.

The far reaching influence and benefits that agriculture in Nova Scotia has received from Agricultural and Farmers' Associations, and their unions, are both direct and indirect. Amongst the former and more plainly visible results might be mentioned the Agricultural College at Truro, the Horticultural College at Wolfville, and Prof. M. Cumming.

Though less in evidence yet equally important are those indirect results, such as are manifest in the improved appearance of our farms, farm houses and buildings, with their contents, the use of improved methods and machinery on the farm, the note worthy increase in the number and the quality of our Pure Bred Stock, and the greatly enchanced value from year to year of our farm products. Nor must we forget to mention in this connection, the inspirations received by our delegates when attending similar meetings elsewhere nor the good results which the application of knowledge there acquired have brought about. We, as citizens of Yarmouth County, are indeed proud of to gain instruction, that we believe, our local Association and feel confident of deriving still further good from your careful guidance.

In obtaining these good results the College at Truro and its staff must be given due credit for it is there we send our boys and men and women togain instruction, that we believe, is second to none in our Dominion.

It was on one occasion jokingly remarked by an officer of one of our county Associations that the Yarmouth County Association could boast at least of numbers and fog, I think I can show that we can boast of some other things too.

The value of the lumber products for our local market and for export amounts to about three hundred and fifty thousand dollars annually.

Our fisheries yield a yearly [illegible] of about one and a quarter million dollars.

The shipping of dried and baled eel-grass to the American markets, an industry confined exclusively to Yarmouth County, reaches the total of about three hundred and fifty tons a year.

The total value of Blueberries and Strawberries sold in the local market and exported amounted in 1911 to over fifty thousand dollars.

Yarmouth has a larger number of Pure Bred Cattle than any other county in Nova Scotia and is head quarters for some of our best dairy breeds. This should be of great encouragement to the proprietors of the newly started butter factory, which we hope will give the dairyman a better price as well as lighten his labor and place on the market a more uniform article.

The large number of oxen for work as well as for beef is continually increasing in number and quality.

There are also large herds of Devons, Durhams and Herefords in several sections of the county, while we are all proud of the herd of Shorthorns recently started at Lawndale Farm by one of our townsmen. Yarmouth makes an excellent showing both in dairy cattle and beef cattle.

The demand in the local market for farm produce, beef, pork, poultry, eggs, butter, and vegetables exceed the supply. The apple production of the county although not to be compared with that of the Annapolis Valley is by no means of small importance.

We have an excellent fruit belt lying along the Tusket and Carleton Rivers and in the Deerfield Valley. This industry is steadily increasing and year by year we see at our local Exhibition a larger and cleaner exhibit showing the benefits of spraying and more careful selection. It is owing to these favorable conditions of climate, of cheap and valuable fertilizers on our sea shore, of a good local market and of our proximity to and daily intercourse with a much larger market for any excess products that while the recent census has shown a regrettable loss of population in some counties, Yarmouth County has not only held her own but gone ahead gaining about 300 in numbers.

There is another industry to which I wish to make special reference an industry that might and could under proper conditions be made of great value, not only to Yarmouth County but the whole Province, I refer to sheep raising, were this industry not so handicapped by the dog nuisance that many of our farmers cannot enter upon it, the raising of sheep for both wool and mutton would soon assume larger proportions. This is an occupation for which no county is more favorably adapted than Yarmouth.

Having given an outline of what is being done and the possibilities of what can be done you will readily see that a great work lies before us as county Association and we urgently desire that you will in the future as in the past give us your careful attention. Situated as we are so far from the Agriculture College at Truro we cannot avail ourselves of the opportunities offered as well as the nearer counties. Therefore you should remember your faraway offspring in some other tangible way.

Again on behalf of the Yarmouth County Association we give you a cordial welcome and we trust that your deliberations on the great question of Agriculture will be such as will strengthen every citizen to go forward with renewed effort.

[illegible] M. P. [illegible]

delegation the most important that had ever visited Yarmouth. His experience had been that farmers were as intelligent and honest as any other class and that they must be reckoned with. He was proud of the delegation that visited Ottawa last winter. It was composed of men of calibre and were straight forward in making their demands. The number of farmer representatives in the halls of Parliament was steadily increasing and he looked for the time when the farmers' demands would be paramount over all other questions.

H. W. Corning, M. P. P. spoke of the inspiration he had personally received from attending the Farmers' Association meetings. He considered the organization the main spring of the Province. Unless the Province of Nova Scotia were peopled with an intelligent, industrious class of citizens she could not take her place with the other Provinces of the Dominion. He dwelt, at some length on the Association and its influences. He had a good word to say in favor of a Dormitory for the Nova Scotia Agricultural College at Truro. As a farmer he was proud of the College and its staff. He was glad the 'Association was meeting in Yarmouth as it would inspire the local organizations to do better work in Agriculturally making for a greater Nova Scotia.

Mr. S. A. Cook, Vice President of the Yarmouth Agricultural Society welcomed the delegates as follows:—

Mr. President, Ladies and Gentlemen:—

It devolves on me, in the absence of our President, to bid you a hearty welcome to our County, and extend to you the glad hand for our Agricultural Society; it being the first time of your meeting here. We are exceedingly glad to have you with us as we have been looking forward to this for a number of years. I trust you will return from this meeting feeling amply repaid for the long and tiresome journey many of you have taken.

Our County, generally, is not thought to be an Agricultural County yet I believe we have possibilities along the lines of Agriculture that few dream of. It has always been our boast that we could produce as much to the acre as can be produced any where of hay, oats, potatoes, mangols, turnips, carrots and ordinary garden truck; besides we have as good grazing ground as one could wish, we also have the name of putting up the best County Agricultural Exhibition in the Maritime Provinces. I would invite you to take a stroll out to our Exhibition building and grounds, it is only a matter of five minutes walk and five minutes more walk and you will reach Lawn Dale Stock Farm owned by our friend, Dr. Lovitt, where you can see a fine herd of Short Horns. Another feature of Agriculture that has sprung up within a few years is the growing of strawberries for the Boston market. This branch is growing year by year and while the expenses are heavy and a number of draw backs such as the late arrival of the Steamers in Boston and no cold storage accommodations yet those in the business find it fairly profitable.

REPLY TO ADDRESSES OF WELCOME.

Mr. A. S. McMillan, of Antigonish replied to the addresses of welcome and in the course of his remarks spoke of the educational value of the meetings held under the auspices of the Nova Scotia Farmers' Association. The aim and object of the individual members of the Association was to help their fellow farmers and in so doing they were helping to promote the various other professions. He thanked the Yarmouth County Farmers' Association for the active interest they had taken in the mother organization, by sending one of their members to meet the delegates and assign them their places at the various hotels and providing conveyances to take them to their respective boarding houses.

Mr. C. E. Saunders, of the Entymological Staff of the Federal Department for Agriculture, who is on Brown tail Moth extermination work, in Western Nova Scotia was present and gave an outline of the work that is being done. Yarmouth and Digby Counties were holding their own but in Annapolis County, owing to a lack of co-operation on the part of the farmers, the Moth was increasing in numbers. He mentioned the fact that possibly, in the near future, a station for the study of insects, injurious to crops, would be established in Nova Scotia.

Short addresses by Prof. M. Cumming, Prof. J. H. Grisdale, Director of Dominion Experimental Farms, Geo. H. Barr, Esq., Chief of the Dairy Division, Ottawa, and W. T. Ritch, of the Sheep Commission, inspersed by readings, solos and duettes by some of Yarmouth's excellent talent followed by refreshments completed Tuesday evening's programme.

WEDNESDAY MORNING.

At the opening session, Wednesday morning, the following committees were appointed:—

Credentials—Samuel Freeman and D. R. Nicholson.

Resolutions—E. J. Elliott, F. W. Foster, Geo. Vinten, Howard Kennedy and D. R. Nicholson.

An unanimous vote of thanks was tendered to the various entertainers who had taken part in the entertainment given at the close of the Tuesday evening session.

Following the reading of the Directors' report, Mr. G. Nichols, Berwick spoke to the reference made therein to telephone systems and strongly emphasized the necessity for the Provincial Government to take over the control and operation of the trunk telephone lines throughout the Province as a means to an end in giving farmers cheaper telephone communication for business and social purposes.

DIRECTORS' REPORT.

In submitting their 16th annual report your Directors think they may congratulate you, as a whole, upon the continued prosperity of Agriculture. The Province of Nova Scotia, although smaller than those further west, is of no small importance and one which can offer substantial inducements to capital and labor on agricultural and horticultural lines. We have been handicapped, to a certain extent by the booming of the Western Provinces, and the "lure of the West" drew many of our bone and sinew that way; but there is an end to all things and this, we are glad from a provincial standpoint to a very great extent has had its day. Farming is a business and needs running on business principles to make it financially successful. Many are looking at it from this point of view, and by applying more thought and using more advanced ways in their operations are more and more realizing it. The leaven of the Agricultural College, the Institute meetings, this Association, Exhibitions, Live Stock Shows, and more progressive farmers have been working towards leavening the whole of the province to more economical production and the welfare of the province.

Something has been done in the past; the future is ours. Let us plan for still more progressive work, that more intelligent soil management and crop production may be further inculcated, that the importance of selected seeds, the destruction of weeds, under-draining and the innumerable improved operations in Agriculture be ever brought before the people, and let us more earnestly endeavor to put into practice what we know to be best. We, in no half measure urged upon the Government the establishment of our Agricultural College; we have got it and on a grand scale. We are proud of it. It is progressing year by year. Let us give it our individual and collective support, so that its work may still be more effective; let us put more life into our County Farmers' Associations, and formation and enthusiasm for the advancement of rural pursuits and rural social life.

Last year we met at Windsor, we had excellent meetings. We went home, having moved, seconded and carried individually a resolution to the effect that we should do better than ever we had done in the past. We meet again this year, at the most westerly point of the province we have visited (and we are not likely in the future to meet much further west) with the same intention and to talk over our endeavors and progress of the past year and gain more in-

Top Row—A. S. McMillan R. J. Messenger G. R. Nichols Samuel Freeman Prof. E. S. Archibald Daniel McDonald

formation and enthusiasm for the present year.

We may say that a cordial invitation was extended to Hon. Martin Burrell, Minister of Agriculture, to be present, but pressure of departmental duties prevented him from accepting. We are pleased at having secured the services of Prof. J. H. Grisdale, Director of the Government Experimental Farms, and we take this opportunity of congratulating him on his elevation to that position. Together with Mr. Geo. H. Barr, Chief of the Dairy Division, Ottawa, and Mr. W. T. Ritch, Wool Expert of the Dominion Sheep Commission, to address these meetings, feeling sure we will gain a lot of useful information from them, not only in the meetings but by intercourse between sessions. We wish to express our thanks to the Department of Agriculture at Ottawa for their services; to Prof. Cumming, Prof. Archibald, Prof. Shaw and others we extend our thanks for help on the programme.

Crops in 1911 were on the whole fairly good, no crop being much above the average, except apples, which was a record one, and during no year have so many been shipped from the far-famed Annapolis and Cornwallis Valley. Not only has the quantity been great but the quality has never been excelled.

The various resolutions passed at the last annual meeting were duly dealt with and action urged in the several quarters, a committee, who interviewed the Premier, were most cordially and heartily received; later on you will hear from this committee so we need not say more here.

The Hon. Sydney Fisher replied in regard to dividing the Dominion Grant to Exhibitions into annual grants, to the effect that the Government undertook to give to each province $50,000, to assist in exhibition work. The question of a second round had not been discussed and until it was he could hold out no hope that this vote of $50,000 would be continued after the Saskatchewan Exhibition.

The matter of the Tariff Reform resolutions, introduced by Mr. F. Miles Chipman, and referred to the Directors, came before the people. It was discussed the length and breadth of the land and the result published in the press Sept. 22nd.

A question brought up at our meeting in Digby three years ago, in regard to the telephone service appears to need further consideration, as the rural communities are not receiving the advantages they should do and which should be possible. One company has now the control of all lines in the province, they are financially very strong, receive provincial privileges and concessions and apparently are amenable to no one. The Public Utilities Commission appointed three years ago does not meet the case. There is but little doubt that the service could be made to pay and pay well, with rentals and tolls considerably reduced, so rural communities are paying more than is necessary for, or are being deprived altogether, by the excessive rates, from the advantages of telephone communication which not only business now demands but social life also. We trust this matter will be again opened and some good come by it, so that we will be able to get an efficient service for a fair and equitable rate. The provincial privileges and concessions should not be given to the shareholders primarily, for dividends but towards advancing the welfare of the province at large.

Before closing we would express our gratification to the Provincial Government for the liberal grant to Agriculture, We trust they will not weary in well-doing, and remember that we are urgently calling for a dormitory for the college at Truro, a thing which is being more and more required as the years go by. We are also pleased that the commercial progress of Nova Scotia in 1911 was very good. The prospects are bright for better and more railway facilities, and initial movements tend towards better and more permanent highways. All of which we trust will materialize in the near future to the advancement of the province.

We hope we have placed a good programme for this Convention before you and trust the meetings may be interesting and profitable.

The treasurer has prepared the following Financial Statement, which you have in printed form in your hands.

J. P. LANDRY,
Auditors.

Truro, N. S., January 13th, 1912,

THE EXHIBITION COMMISSIONERS' REPORT.

Mr. President and Gentlemen of the Nova Scotia Farmers' Association.

As your representatives on the Exhibition Board, we again beg leave to make our Annual report.

On the whole, we consider the Show of 1911 well up to the average—and in many ways far above it. On the whole, the buildings were fairly well filled, with the exception of the Horticultural Hall, which, owing to the early dates contained no fruit of any kind.

The live stock exhibit showed a slight falling off in some departmeats particularly in beef cattle and heavy horses, while the dairy entry was the largest ever received. The poultry how was particularly good and showed to great advantage in their new quarters.

The Fisheries building was a source of great attraction to all visitors, and contained the best display ever exhibited in the building.

The Mines building contained displays of the Province in both raw and finished states and was well filled.

Machinery Hall was not so well filled as on some occasions. The principal exhibits were carriages, spraying outfits, automobiles and mill machinery.

Nearly every available foot of space in the Main building and annex was occupied by Manufacturers and Dealers. The annex being practically filled by the "Made in Halifax" exhibit.

Owing to the early date and the dryness of the season, the Agricultural Hall did not present the appearance that we should like to see. The same might be said of the Dairy products. The cost of running the show was about the same as last year and varies very little from year to year. This year the maintenance account is a little larger than usual, owing to necessary repairs to the buildings and fences.

The amount paid for Prizes is much less than last year owing largely to the fact that there was no fruit exhibit, and went to the Provinces as follows:—

Nova Scotia.....	$6,160.50
New Brunswick.....	1,088.50
Prince Edward Island...	841.50

The financial statement shown at the end of the year, to our mind, was very satisfactory. The Subsidy (for this is the name that the deficit should be called) being only $11,288.-10. When you consider that included in this, are fixed charges such as Insurance, Interest, Caretaker, Maintenance, Etc., amounting to over $5,000, it certainly makes a very creditable showing.

You will, no doubt, remember that last year we had no special attraction in front of the Grand Stand. This year we returned to our former practice of putting on attractions, other than the races, and we think the results prove conclusively that they are required.

The receipts from the gates and exhibitors tickets were $4,800 more than last year, while that for privileges was nearly $400 more. The entry fees (owing to not having a fruit exhibit) were nearly $200 less, while in the speed classes they were $1,000 more. The total receipts being $6,100 more than 1910.

We would again urge this Association to make a move whereby legislation may be obtained at the coming Session, so that any part of the grounds can be used for legitimate means of revenue, during any time of the year.

With regard to the coming Show, the dates have been set for the middle of September, which should be a good time for both exhibitor and visitor.

The Prize list has been passed upon and with the addition of Fruit is about the same as last year.

We again appeal to you to stand shoulder to shoulder for the betterment of our Show, and let us all do all in our power to make our Nova Scotia Provincial Show the best in Eastern Canada, for in our hands lies its future.

Thanking you, gentlemen, for the honor of representing you on the Board of Commissioners,

Respectfully submitted,
R. S. Starr,
Chas. R. B. Bryan.

The Exhibition Commissioners' report was followed by a lengthy discussion on Exhibition matters.

Mr. C. A. Maxwell, of Pictou, said the average farmer was not benefited by the Provincial Exhibition. The local show was, however, a splendid educator and a means to an end in interesting the disinterested.

Mr. Howard Kennedy, Past President of the N. S. F. A., also spoke in favor of the local shows but thought the Provincial shows also played their part in advancing agricultural interests. Local shows were feeders to the Provincial show.

Mr. G. Nichols, of Kings Co., expressed the view of the small exhibitor. It was difficult for a small exhibitor to go to Halifax with his stock and come away with the balance of his winnings on the right side of his ledger, yet he favored the holding of an annual exhibition at Halifax. The small fruit shows in various parts of the Provinre had outlined their usefulness.

Mr. Wm. O'Brien said Halifax was the place for the holding of a Provincial fair but the time stock was required to be kept on the grounds was entirely too long. He reierred to the Royal Show, England, as being a one week Fair and thought Halifax might profit by following the example.

Mr. C. C. H. Eaton, would like to see more encouragement given to exhibitors of grade steers at Halifax. The present status of the beef raising industry demanded further encouragement He thought the Halifax Fair did not fill the bill in this respect.

Mr. F. L. Fuller, Superintendent of Agricultural Associations, in Nova Scotia, explained that many of the local County Shows received larger grants in proportion to the amount of prizes paid out than did the Halifax Exhibition. The Halifax Exhibition received no grants such as the Local Shows received and consequently the yearly deficit of the Provincial Fair looked more formidable than it really is. The city of Halifax pays one-half of the exhibition deficits and he thought they were getting full value for their money.

Mr. F. W. Foster, also thought the time live stock was required to be kept on the grounds was entirely too long.

Mr. W. W. Black, also said the time was too long. He tnought the Exhibition should open on Saturday and close on Thursday night. He recognised the Halifax Fair as being a highly educational Show. Breeders of pure bred stock must be encouraged to show as they, not infrequently pay large sums of money for imported sires, while they sell the progeny of these sires for the improvement of local herds at low figures.

Mr. S. A. Logan, said the grade stock received as good a Show at Halifax as did pure breds. The Show should have the unanimous support of the farmers as it was at Fairs of that kind that pure bred live stock breeders could educate the masses to the ideal in their respective lines.

Mr. C. R. B. Bryan, said the Provincial Fair was one of the best advertisements Nova Scotia could possess. The only trouble in regard to shortening the show period was the fact that if adverse weather conditions obtained, for a day or two while the Fair was being held, it would be very detrimental to the Exhibition finances.

Mr. H. W. Corning, referred to the satisfactory arrangements that had been made re the transportation of live stock from Western Nova Scotia to the 1910 and 1911 Halifax Exhibitions. He was in favor of opening the Halifax Show on Saturday and closing on Thursday night. It was not all plain sailing for even the most extensive prize winners to be retained at Halifax for over a week. The expense account incidental to showing was very materially increased through a prolonged show period. He believed both pure bred and grade classes should have an equal footing on the prize list.

Col. S. Spurr, said he himself was a better farmer through the incentive received from visits to the Halifax Exhibition. Each and every farmer in Nova Scotia could exhibit some of their produce and help to increase the interest in and improve the exhibition. Local fruit shows were not so valuable as the provincial fair in advertising the fruit growing possibilities of the Province. He believed if suitable dates were secured and a proper prize list arranged fruit should be shown in car-load lots as well as on plates, in boxes and in barrels. The Halifax Fair was held too long.

Mr. J. R. Webster, favored the scheme of showing fruit at Halifax in car lots.

Mr. A. S. McMillan, thought the local shows were doing good work in reaching the classes that are not interested in the Provincial fair. While the exhibits were not so numerous at the former, in many cases the quality was just as good as of that shown at the latter.

S. A. Cook, said the local shows were doing a good work in interesting the boys in live stock judging.

Mr. Wm. Murray, Pictou Co., thought the Halifax fair was getting monotonous as there did not seem to be much new blood introduced. He had seen the same old animals led out to victory year after year.

Mr. W. W. Pineo, said the breeders

Nova Scotia Fruit Growers' Convention

The forty-eighth annual meeting of the Nova Scotia Fruit Growers' Association was held in Wolfville, N. S. on the 15th, 16th and 17th inst. Despite the driving storm that raged without a large and appreciative audience listened to R. J. Messenger's presidential address in the course of which he referred to the year's work and the prospects of an increased facility in the establishment of an Experimental Horticultural Farm at Kentville.

Mayor Harvey of Wolfville welcomed the members and the remainder of the evening was taken up with addresses by A. L. Davison, M. P. P., Dr. Cutten, Prof. Cumming, W. T. Macoun and others.

PRACTICAL PACKING DEMONSTRATION.

Mr. Carey, of Toronto gave a practical talk accompanied by demonstration on packing apples before a representative gathering on the morning of the second day of the Convention. He was assisted in his work by Inspector G. H. Vroom. The afternoon and evening sessions were devoted to orchard practice and the commercial end of the apple business.

EXPERIMENTAL FRUIT STATIONS

W. T. Macoun, of Ottawa, spoke on "The work on an Experimental Fruit Station." In the beginning he asked pardon for speaking on this subject, which properly belonged to the new Superintendent, Prof. Crowe, whose appointment to the Experimental Fruit Station in Kentville, had just been confirmed, but the subjects had been assigned before the appointment had been made.

Prof. Macoun gave a list of all the fruit stations in Canada. His work is to visit all these, to confer with the Superintendent, and suggest new lines of work, and be of any possible aid.

(1) The most economical way of using fertilizers to get the best out of our fruit trees. The question of commercial fertilizers and the value of ploughing under the green crop, and the necessary fertilizers to be added to this were things all to be learned and then taught from the Kentville station.

(2) The best method for cultivation for big crops—not only quantity but quality, color, uniformity of size,—and told of the methods of investigation carried out in various parts of the United States.

(3) How can we best cultivate our fruit for color and maximum size, is a most important question. Top grafted trees, particularly, produce high-colored apples, and these are particularly desired in the markets of the world, how to produce them best is a very vital point.

(4) What ages of trees and what method of cultivation will give early bearing? One or two-year old trees were, in his opinion, the best. The variety of trees, the stock, etc.

(5) Fall vs Spring ploughing was a great subject for experiments.

(6) What is the best cover crop to use?

(7) What is the best method of pruning for our fruit?

(8) The most economical methods of spraying, the time, and how often we should spray. This question could not be answered hurriedly as the experiments would doubtless extend over a period of five years.

(9) The relative resistance of different varieties of apples to scab and codling moth.

(10 The relative keeping and shipping qualities of the different varieties of fruit.

The testing of new varieties, especially of British and European varieties. It is a well known fact that they succeed better here than elsewhere in Canada. The Government are getting 38 new varieties to plant on the Kentville station in the Spring. Of the 35 varieties now grown in the Annapolis Valley, there will be planted 25 trees each for the purpose of comparison. About 1200 trees in all will be planted this year. Not a really perfect variety of apple is produced here, and this station hopes to ultimately produce an apple combining all the good points of our most marketable apple.

The raising of seedlings and cross-breeding will receive considerable attention.

(11) The relation of farming to fruit growing will be shown in the development of a part of the station as a practical farm where cattle will be raised, etc.

(12) How best to use the land when the young trees are growing.

(13) The beautifying of farms and fruit-growers' houses, and how the stations hope to help along this line of work. The station is to be a Bureau of information on all points to farmers and fruit-growers.

During the entire address, Mr. Macoun answered questions and made comments on the work in hand, which were of great benefit.

Mr. J. R. Starr, acting superintendent of the Kentville Experimental station, told briefly what had been done at the farm while under his charge. The farm consists of 240 acres, 3-5ths of which will be devoted to horticulture, a portion to general agriculture, a portion for grass land, a large part for forestry, and about ten acres for buildings and beautifying. Twenty-five acres are now ready for planting the experimental orchards. Ten acres more will be used in the following year. Roads will be laid out and landscape gardening will receive a good share of attention.

Colonel Spurr, of Melvern Square, one of the old stand-bys of the Association, introduced several resolutions respecting the recent appointment of Mr. Martin Burrell as Minister of Agriculture, and the pleasure of the Association in regard to the appointment, and also their entire sympathy and confidence in the appointment of Prof. Crowe, as Director of the Kentville Experimental Station.

The third resolution was: "Whereas the system of inspecting apples in the Province of Nova Scotia, which has been in practice for the past few years, mainly at the port of shipment, is not entirely satisfactory to the fruit-growers of the Province,

"And Whereas, as many of our apples are shipped through different channels. whereby they receive no inspection at all,

"Therefore be it resolved. that inspection be done at the fruit warehouses or railway lines, and but a small part at the place of shipment. In order that the best results might be obtained in apple inspection, we would recommend that the apple section of the Province be divided into districts, and each inspector be given a district to care for."

POULTRY RAISING.

Mr. M. K. Ells gave a very practical paper, his personal experience in poultry raising, in connection with orcharding.

The raising of beef cattle was rather arduous work. Dairy products were more or less, too, of a risk, and entailed considerable labor,—but the hen gave the finished product. In other words, she milked herself and made the butter. The food was, of course, the secret ol good production, and he laid his scheme of diet before the audience and answered innumerable questions. Mr. Ells puts it that the apples with him are a by-product of the poultry industry, and in his opinion no two things worked together could produce better results.

The resolution regarding apple inspection was fully discussed. Capt. C. P. Allen, Kentville, condemned the whole system of inspection. Halifax was no place for it. The apples should be inspected at the warehouse or the place of packing. Mr. W. W. Pineo did not agree with Captf Allen, and showed how it would be a foolish move to change the method of inspection. He did not approve of the dividing of the district into small sections. The best man to inspect the fruit was not your own neighbor, but someone from outside the district. He said that the trouble was that there were too few men on the force. They need young, vigorous, sturdy men, who could stand the rigors of the work, and then there would be no complaint.

Mr. J. V. Chute, Waterville, condemned the present system of inspection,—it was done too hurriedly. The warehouse was, in his opinion, the place. There was to be a change in the system. He was speaking with authority, and the Government were looking to the fruit-growers to tell it what they wanted.

J. Howe Cox, Cambridge, was of the opinion that apples should not only be inspected at the warehouses, but at the docks as well. The crying need in Halifax was a place to store apples while they were waiting for the steamer.

Col. Spurr advocated for each man his own warehouse, if possible, and apples honestly packed at home. "How long," he asked, "after the barrel had been packed could it be condemned? What were our delegates to say when they went to Ottawa? Let us act as sensible men, stick together and fight for it, and we'd get it sure."

Mr. C. R. H. Starr, Mr. Bigelow, Mr. Robert Starr, Mr. Innis, Mr. John Buchanan, Capt. C. O. Allen also spoke.

Mr. C. R. H. Starr moved that this much discussed resolution be referred back to the committee for amendment.

This is regarded as one of the largest meetings in the history of the Association. Beside the old members, there were many new faces. The meetings were all well attended.

BROWN TAIL MOTH.

During the meeting, there was considerable heard about the brown-tail moth. This subject was not on the programme, but the talk was due to the fact that this terrible pest is on the increase. The party in search of the nests at Bridgetown have located some 1200 nests, and another party operating at Bear River, Smith's Cove, Deep Brook and Middleton, have found 2,364 nests. In former years, this pest attacked only apple, plum and pear trees. This season nests have appeared in oak, thorn, wild pear, quince, maple, cherry, elm, beech and birch. The moth is also becoming acclimatized, and spins its nest to meet the climatic requirements.

Now is the time for everyone to get out and fight this pest. If not, it has come to stay, and only active co-operation, with the official agents will stay the ravages of this most destructive insect.

TRANSPORTATION AND MARKETS

Tuesday's evening session was devoted to "The Commercial End of the Apple Business," and the first speaker was W. W. Moore of Ottawa, who took for his subject, "Transportation and Markets."

His figures were very interesting, and surprised many in the audience, when he stated that up to Jan. 12th, the total export from the Province to British, foreign and home markets, amounted to 1,020,657 barrels. The only year previous which came anywhere near this record was in 1909-10, when the mark reached was 711,000 barrels. Speaking of each market individually, Mr. Moore said that this year Nova Scotia apples had won a high place and were now recognized as somethiog to be reckoned with. The German market, practically unknown before, might, in time, become very important, and he explained the climatic situations, tar-

Fruit Pit or Baldwin Spot.

It will be of interest to fruit growers generally to know that this disease has been reported from practically every apple growing section of B. C. and the neighboring States this year. Not only is the Interior affected, but the Coast as well, while probably the greatest losses are reported from the most prominent fruit sections.

This trouble goes under a confusing variety of names. The principal ones commonly given by fruit growers are: Baldwin Spot, Fruit Spot, Dry Rot, Bitter Rot, Brown Rot, Physiological Dry Rot, and Fruit Pit. In Germany, the common name is Ztippen, or Stippichderden; and Bitter Pit in South Africa. No scientific name has been given, berause no specific cause has yet been discovered.

At first the appearance is that of roundish brown spots, just below the surface of tne skin of the apple, or perhaps up to one-quarter of an inch deep. When near the surface, there is a smaller circular depression just above the spot. On the colored portion of the apple this depression is surrounded by slightly deeper color, and on the green parts of the apple the depression is deeper green, changing later to brown. The brown spot is pithy in character, dry, and comparatively tough. The spots are generally from one-third to three-sixteenth of an inch in diameter, and of not quite the same depth.

As the trouble develops, more spots occur, and finally the brown may extend in a more or less complete network through the outer tissues of the apple. The affected flesh is dry and flavorless, but not bitter. The appearance and saleability are very much impaired, and, even for cooking purposes, badly affected fruit is not of much use.

In the third stage, the apple becomes practically entirely brown, and quite worthless.

In its first stages, the Fruit Pit is hard to distinguish from the effects of hail. Another type affects early apples particularly, causing a more or less complete browning of the tissues surrounding the core. In this case, the apple becomes valueless commercially before its outward appearance is much affected.

Variations of the above forms, and very similar forms, are found in the apple, pear and prune.

This disease has been known and been under investigation for thirty years, principally in Germany, and, during the past ten years especially, in the United States and Canada. It is agreed that it is not caused by any fungous, bactorium or insect. The organism causing it is absolutely unknown. Spraying experiments have proven absolutely valueless. Scientists are now thoroughly agreed in designating it as a physiological trouble in the same class as Water Core.

The true Baldwin Spot of New York State, the true Bitter Rot of the Middle West, the true Apple Scab or Black Spot—are all fungous diseases, and the life history of the organism, like that of typhoid and tuberculosis, is well known to investigators. The disease above described is none of these.

While the absolute cause is unkown, there have been discovered certain inducing causes. These are:

1. Light yields of sappy, usually large, fruit.
2. Heavy wood growth, from two to four or five feet in length.

The light yields and heavy growth are due to the following causes:

1. A heavy crop the previous year.
2. Young trees.
3. Heavy winter pruning.
4. Excess of water by rainfall, seepage and irrigation.
5. Clean cultivation.
6. Nitrogen in the soil in excess over potash and phosphoric acid.
7. Unhealthy or winter injured trees.

Any one or any combination of the above conditions may be sufficient to bring on Fruit Pit.

The remedies are:

1. A good, heavy crop of fruit.
2. A reasonable growth, consistent with the age, size and health of the tree.

To secure heavy crops and a mature growth, the following are of importance:

1. Rational winter pruning, replaced by summer pruning if absolutely necessary.
2. The maintenance of the proper moisture supply, less irrigation, proper drainage.
3. Less clean cultivation. Put the orchard in sod, if necessary.
4. Decrease the amount of soil nitrogen by lessening cultivation, by putting the orchard in sod, or planting intercrops, and where necessary balance the nitrogen supply by adding potash and phosphoric acid. Unhealthy trees should be given proper conditions as above, to regain vigor. Properly cared for, they will produce a much higher class of fruit. Badly diseased trees had better be removed.

It is the application of the above remedies under local conditions, which calls forth the skill of the grower.

More rational methods of orchard cultivation are absolutely essential to permanent control of this disease. Its prevalence this year has aroused much needless apprehension in the minds of fruit growers. The disease can be avoided almost entirely by the proper methods. It is significant that good intentions, rather than wanton neglect, have brought it on, to a very large degree. The methods above recommended, skilfully applied, will result in much greater yields of fruit per tree and per acre. The cost of production per box will be actually lessened considerably, and the general quality and color of the fruit raised in equal degree.

In view of the possible injury which may be caused by needless alarm, it is to be hoped that fruit growers will investigate the subject rationally, and, having formed their conclusions, work out the remedy best adapted to their own orchards. It is encouraging to note that the prevalence of Fruit Pit in one orchard has no effect whatever on the orchards of the same district. Contagion and infection are impossible.

An Orchard for the St. John Board of Trade.

On the recommendation of Mrf A. G. Turney, Provincial Horticulturist for New Brunswick, members of the St. John Board of Trade have subscribed funds for the purchase and operation of a commercial orchard near St. John. This is a move in the right direction. Mr. Turney has recently addressed several of the most progressive Boards of Trade in the province and much enthusiasm re commercial and experimental orcharding has been the result.

Every farmer worthy of that distinguished appellation should have a good family apple orchard and he greatly discounts his own intelligence by its neglect.

Yellow Dale Farm Barn—Roofed with NEPONSET Paroid Roofing.

The Real Rival of Best Shingles

Time was when you could buy old fashioned heart-of-the-log shingles and you *knew* they would *last*. But are the shingle roofs you have been laying in recent years *really* going to *last?* Time will tell you. Time has already shown thousands of farmers that

NEPONSET

PAROID ROOFING

Lasts Like Old Fashioned Shingles

Many of its long-wear records have been made on farm barns and farm buildings just like your own. And NEPONSET Paroid costs less than shingles—it costs less to lay, too. You are sure of its quality—every roll is inspected, tested, guaranteed. In addition, NEPONSET Paroid gives real fire-protection.

When are you going to stop buying roofs that you *think* will last and start using NEPONSET Paroid that you *know* will last? Get all the facts. Write for booklet and name of NEPONSET dealer. Learn how other farmers are economizing on their roof problems.

NEPONSET *Proslate makes a handsome reddish brown roof for houses.*

DAIRYING.

Farm Dairying.

There has come to hand quite a dainty volume on "Farm Dairying." It is the work of Miss Laura Rose, Demonstrator and Lecturer in Dairying at the Ontario Agricultural College, Guelph, Ont., who has since become Mrs. W. F. Stephen, Huntingdon, Que. It is probably unique in being the first publication of such magnitude on the subject of dairying from the hand of a woman in Canada at least.

In a brief introductory note the authoress says: "In this book it has been my earnest desire and aim to present the dairy industry in a simple practical manner, in the hope of benefiting those desirous of improving and succeeding in their chosen occupation." Being the product of the experimental work and study of one who is a practical dairymaid and college professor combined, the volume presents itself as a particularly useful and welcome work to the legion

Mrs. W. F. Stephen, Huntingdon, Que., well known to our readers as "Laura Rose."

of women engaged in or associated with the dairy industry.

But it is not merely because it is a woman's work that the book should appeal to women; it is because of its high excellence, thoroughness and completeness of exposition of the dairy industry in Canada and in Ontario, in particular, that it should become a handbook of information and reference to all dairymen and dairywomen. It is particularly well suited to the aptitudes of the young as well as to their needs in the various branches of dairying. The distinguishing literary marks of Miss Rose's "Farm Dairying" are, combined with an animated, graceful style, condensation without loss of matter and a simplicity and lucidity that would make any subject pleasant reading. It is nicely printed and bound by A. C. McClurg and Co., and the matter is so conveniently and clearly arranged that, no matter where the reader opens the book, he finds himself at once at home and in medias res, so to speak. It is also beautifully and profusely illustrated, and its very appearance invites close acquaintance.

As a sample of her style Miss Rose will permit the reviewer to present tne following passage to the readers of The Maritime Farmer. She is writing on the necessity of a standard and a record. She writes:—

"There is but one way to determine the value of a cow when you have her, and that is to weigh and test her milk systematically. This gives proof positive of her profitableness. Shrewd dairymen are universally adapting this plan.

"Receiving good care, a cow should give six thousand pounds of milk, testing at least 3.6 per cent fat, or should make two hundred and fifty pounds of butter in a year. A heifer should reach this amount in her second lactation period. This is not a high standard, but if put into force throughout the country would mean that three-quarters of the cows would be doomed. The average yearly yield per cow is not over four thousand pounds of milk. With such an average, how many very poor ones there must be! What about yours? In nearly every stable there are sleek, gentle cows, who stretch their necks as greedily as can be for mangels and meal, and who walk forth with a leisurely important air to pastures green and luxuriant, the pets often of the herd; and yet if X-rays of the scales and the test for fat were thrown on such cows, the revelation would assign them to the butcher's block.

"Keeping a daily record gives the owner and his help a personal interest in, and oversight of, each cow. It often results in a severe weeding out of the poor ones. It makes the work of herd-improvement quicker and surer."

One of the best chapters in the book is devoted to that subject about which dairy people can never know too much and only too frequently realize that they know too little, namely, the care of the cow in calving time, and also the proper care of the young calf. A great deal of attention is paid to feeding and the composition of rations, to fodder crops and ensilage. The instructions on milking are about the best, most complete and most common-sense ever read anywhere by the reviewer. An observance of Miss Rose's directions would result, and at no additional cost or labor, in much more clean milk for the factory. All that is required is to do the right things at the right time and, above all, have as clean an atmosphere as possible at milking time.

There are chapters devoted to—Milk for the Cheese Factory, Separating the Cream, the Pasteurization of Cream, Butter-making, the Retail Milk Trade, the Retail Cream Trade, Profitable use of the By-products of the Dairy, the Babcock Milk Test, Diseases Common to Cows, Symptoms and Treatment.

The book is a very complete, thorough and wholly reliable manual on Farm Dairying and should have a place in every farm-house in Canada. Its ideals are true, economic and would prove profitable, and they are realizable by any farmer of intelligence and ordinary ambition in the land.

The price of the book which contains 300 pages is $1.35 postpaid. If you want a copy and The Maritime Farmer would advise you to get one, send your order to The Maritime Farmer or to Mrs. W. F. Stephen, Huntingdon, Que.

Following are some of the good things authorities say about "Farm Dairying": "I have had occasion to read a multitude of books and publications on dairying, but I assure you that when I say I have never read anything that seemed to me so complete, so comprehensive and at the same time so concise and readable on this subject as 'Farm Dairying,' I quite fail to express my appreciation. This book seems so well calculated to be of use to every man or woman interested in milk production and milk handling on the farm that I hope it may meet with an immense circulation. Let me assure you that I shall not fail to advise its purchase by any seeking full and reliable information along these lines."—Prof. J. H. Grisdale, Director, Experimental Farms, Dept. of Agriculture. Ottawa, Canada.

"I would like to see a copy of 'Farm Dairying' in the hands of every dairyman in Canada. It is full of practical information, carefully compiled, and based on scientific principles. It is just the kind of a book which is needed, and I shall be surprised if it does not have a very large sale."—J. A. Ruddick, Dairy Commissioner for Canada.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

THE SHARPLES SEPARATOR CO.
Toronto, Ont. Winnipeg, Man.

"I Don't Believe It."

Hoard's Dairyman says:—

"Take one of the common sort of dairy farmers you meet with everywhere, as we did in a short auto trip the other day. His main attitude of mind was "I don't believe it." He had a poor lot of low Shorthorn grades for cows.

"Their gross earnings at the creamery last year were $48 per cow. When we ventured to remark that there was a better and more profitable breed of cows for him to employ his time on and provide feed for, than those he had, his attitude and manner spoke as loud as words "I don't believe it."

"We told him of herds that we knew about, of other herds that had averaged last year in some instances, over $100 per cow, but still it was "I don't believe it."

"We called his attention to the silo and told him what a wonderful saving a good supply of ensilage had been to us the past summer, and how it enabled us to keep a large stock on the same capital in land and thus make that capital pay a better interest. But his face looked as unbelieving as ever and said plainly, "I don't believe it."

"We spoke again of the wonderful feeding value of alfalfa and how nicely it helped to raise the young things and pour out milk from the cows. But still he "didn't believe it."

"None of the better things and methods of a more profitable kind of dairying did he believe in. He was "agin it all." He was morally certain that everybody who would try to run a dairy on that basis would lose money by it. He had to admit that he was having "hard sledding" himself, but we could no more get him to consider that it was because he was using wrong methods than nothing at all.

"We noticed, however, that his son, a youth of eighteen, was listening eagerly to what we were saying. But when the boy undertook to put in a word or two, the father would shut him up by saying, "What do you know about these things?"

"Here was a man fighting his own betterment and trying to maintain old wasteful ways. There are thousands of such men today who are keeping cows for profit and making a losing job of it. A keen, practical dairy farmer said to us one day: "I wish we could have about two years of right, hard times." "Why?" "Because it would drive out of the business the stupid men who don't know any better than to make butter that costs them ten cents a pound more to make than they can sell it for."

"The thick hide of disbelief of every right way and method that these men wrap themselves in, is one of the big questions of the day in the work of all agricultural improvement. What they don't believe is making thousands of wiser farmers rich. What they do believe is making them poorer every day. And still they "don't believe it."

$15.95 AND UPWARD
AMERICAN SEPARATOR

SENT ON TRIAL, FULLY GUARANTEED. A new, well made, easy running separator for $15.95. Skims hot or cold milk; heavy or light cream. Different from this picture, which illustrates our large capacity machines. The bowl is a sanitary marvel, easily cleaned. Shipments made promptly from ST. JOHN, N. B. and TORONTO, ONT. Whether dairy is large or small, obtain our handsome free catalog. Address,
AMERICAN SEPARATOR CO. Box 1212 BAINBRIDGE, N. Y.

Dairying in Nova Scotia.

One of the most popular publications, gotten out by the Department of Agriculture for the Province of Nova Scotia, was a series of articles on Dairying in Nova Scotia, first published in 1908. The original publication of these articles became exhausted about six months ago and the Secretary for Agriculture of the Province of Nova Scotia has had these articles revised and added to and the new edition is now ready for circulation. Those farmers, who are interested in getting the most up-to-date information in regard to such subjects as the feeding of dairy cows, testing of milk, the history and description of the various breeds, a description of method of treatment of the various diseases, will do well to write to the Department of Agriculture at Truro and ask for a copy of this bulletin. As long as the edition lasts, it will be supplied free.

Altogether the edition comprises 172 pages and it is replete from beginning to end, with practical information in regard to almost every phase of the dairy business. There are excellent illustrations of cows of the various breeds and also a few illustrations of dairying scenes in the Province of Nova Scotia.

There are two excellent articles on Stable Construction. These include several cuts of the dairy stables at the Nova Scotia Agricultural College.

The bulletin begins with a quotation from a speech delivered by the Hon. Sydney Fisher, late Minister of Agriculture for the Dominion of Canada, which runs as follows:

"Whenever I have visited the various parts of the world, I have found the most universal prosperity in dairying communities. Moreover, I have always regarded the Maritime Provinces especially adapted to this industry."

This is really the key note of the whole publication and we would strongly advise all who are interested in the important subject of dairying in the Maritime Provinces to secure a copy of this publication.

Weigh the Milk.

It is as impossible to estimate the productiveness and value of a cow as it is to guess the exact number of bushels of corn a certain field will yield. The scales and a Babcock tester, when rightly used, will accurately determine whether any of your cows are grafters just as surely gs a pair of farm scales will show the exact yield of corn. Don't put up with a robber cow.

WINDSOR DAIRY SALT

"Expect to get the prize for the best butter, this year?"

"Of course I do.

I have the best cows in the country—and here's my Windsor Butter Salt.

You can't beat that combination.

You know, I have won first prize for the best butter ever since I began to use Windsor Butter Salt"

"Hope you win"

"Thank you, so do I"

Our 1912 Style Book of Women's and Girls' Outer Apparel Mailed Free to Every Lady Reader of "The Maritime Farmer" for the Asking.

A 32 PAGE CATALOG compiled by a New York style specialist. It shows the latest styles in COSTUMES, COATS, DRESSES, BLOUSES, etc.

We are printing 30,000 copies of this catalog, but already 20,000 copies are asked for, so we earnestly urge you to write us. A postcard will do.

Here are a few hints of what our catalog contains.

Pictures of beautiful waists and blouses in washable materials ranging from **75c to $1.55.**

Magnificent cloth costumes with coats lined with guaranteed satin Price from **$13.75 to $24.50.**

Charming wash dresses for Misses and Women. Prices run from **$1.95 to $5.00.**

Beautiful wash dresses for Girls in print and chambray priced from **75c to $1.50.**

AT LOWEST PRICES we show the season's best styles in Coats, Skirts, Golf Coats, Fine Dresses, Underskirts, Kimonos, House Dresses and Bathing Suits, etc.

We Prepay All Transportation Charges.

The demand for OUR CATALOG will be so great that thousands will be disappointed—so if you want to see the Charming Garment Styles which will be worn in 1912, write now and a copy will be promptly sent.

Black Leg.

W. J. Campbell, Cumberland Co., N. S., I have a few questions to ask re diseases in cattle. Two of my cattle died this fall. A yearling heifer was first affected, the symptoms being a shortness of breath followed by the swelling of a shoulder, lameness and sudden death. In about two weeks after the heifer died a calf died being similarly affected. The heifer's shoulder was black with dark watery blood under the skin. I burnt the carcasses. Can you give me a cure for animals so afflicted? Please give me all the information you can re this matter.

Ans.—This disease is known by several names, viz: Blackleg, Black Quarter, Quarter Ill and several others. Blackleg being the most common term. It is a rapidly fatal infectuous disease and mostly affects young cattle from six months to two years of age. Sheep and goats may contract the disease but man, horses, hogs, dogs, cats and fowls are immune. The cause of the disease is a bacillus or germ. Symptoms may be general or local, more frequently local. The general symptoms are loss of appetite, cessation of rumination, dullness, debility and high fever, the temperature rising to 107 degrees F. To these may be added lameness or stiffness of one or more limbs and a tumor or swelling under the skin, which when rubbeh produces a crackling sound due to the gas formed in the part. The tumor may appear in the thighs, shoulders, neck, breast, flanks, throat or base of the tongue.

In this disease remedies have thus far proved unavailing. Many remedies have been recommended but thorough trials have proved them valueless, so precaution is the advisable course. The Hypodermic injection of Blacklegine, a Blackleg vaccine, is the only safe course. This should be performed by a competent veterinarian as the doses should be regulated according to the age and size of the animals treated. The remedy may be secured from several makers but the veterinary director General's Department, at Ottawa, furnishes a reliable vaccine with full instructions for use, so it is advisable to apply there. Of course it is advisable to destroy all d animals that die from this disease preferably by burning as well as all contaminated litter and then disinfect stables. Remove healthy animals from poluted pastures a good way, to rid infected pastures is to allow the grass to grow long, become dry and then burn it. It is advisable to repeat the burning two or three times. As to the efficiency of the vaccine treatment in the United States where 7,700,000 doses have been sent out of the percent of loss has been reduced in some localities from 20 percent to less than 1 percent per annum and equally good results have been secured in Alberta where the disease caused heavy losses before the discovery and use of this preventative.—J. Standish, V.S.

Minard's Liniment Co., Limited.

Gentlemen,—I have used MINARD'S LINIMENT from time to time for the past twenty years. It was recommended to me by a prominent physician of Montreal, who called it the "great Nova Scotia Liniment." It does the doctor's work; it is particularly good in cases of Rheumatism and Sprains.

Yours truly,
G. G. DUSTAN,
Chartered Accountant.
Halifax, N. S., Sept. 21, 1905.

Preventing "Fly" or "Maggot" in Sheep.

Every shepherd and sheepowner is familiar with the conditions under which sheep become "fly"-blown, and with the effects produced by the maggots, but not all of them are aware of the means of prevention, or at least they do not put them into practice. Prevention, in the case of "fly," saves the animal much pain and annoyance, and the owner loss of mutton and considerable damage to the fleece. It includes the prompt treatment of shearing cuts, dealing with wounds, or abrasions of the skin generally, at the time of their infliction, and especially of shearing wounds, which are too often neglected. The increasing employment of machines in shearing is tending to the reduction of this cause of "fly"—they do not nip out pieces of skin like the old-fashioned shears, carelessly or unskilfully used. For the protection of wounds, oxide of zinc ointment, to which ten drops of pure carbolic acid has been added to each ounce, or a mixture of flowers of sulphur and carbolised oil is useful. The sulphurated oil may be carried in a can, and applied with a brush, after stirring. The removal of dirty locks of wool, and the trimming up of soiled parts, when, owing to the nature of the food or other cause, the animal suffers from diarrhoea, is of much importance. These precautions, however, will not always suffice, for the yolk of the wool, unless poisoned or rendered distasteful to the "fly," proves a sufficient attraction, and the pest will sometimes "strike," especially on hot, sultry days, and when there is "thunder in the air."

POWDERING, DIPPING AND SPRINKLING.

"Powdering" used to be the favourite method of prevention by poisoning the fleece, but dipping or sprinkling with a fluid preparation has largely superseded it, as being more economical as well as more efficient. Fly powders consist for the most part of mixtures of sulphur, arsenic, powdered hellebore, white lead, alum, cinnabar of antimony, prepared chalk, umber, Armenian bole, and whale or fish oil, in various combinations and proportions, and some old-fashioned sheep farmers still cling to such agents; but they are not nearly so effective for "fly" prevention as a reliable dip. As to what constitutes a reliable dip, there exists some difference of opinion, but as an effective preventive of "fly," and in order that it may be lasting, it is necessary that it should be of the poisonous variety. The "poison" bogey frightens a good many, but, properly prepared, poisonous dips are perfectly safe, if properly used, which, of course, includes rigid adherence to specific directions framed by the proprietors to ensure safety and efficiency. Such a dip, by remaining in the fleece, will, if employed in the early part of the season, to a great extent confer immunity from "fly" attack, as well as prevent the development of the larvae. Sprinkling is very much akin to dipping, the same solution being used. It is practised when it is not convenient to dip each sheep individually, and secures the saturation of the fleece at parts most likely to be "struck." For sprinkling, sheep are penned closely together, and the solution applied to the fleece by means of a watering-pot with rose attachment, but this plan is not to be compared for efficiency with individual dipping.

With further reference to the selection of a dip, there are preparations, though quite equal to killing any vermin the sheep may harbour at the

FREE!! $200.00 IN CASH

AND 1,000 VALUABLE PREMIUMS GIVEN AWAY

1st Prize, $50.00 in Cash - 3rd Prize, $35.00 in Cash
2nd Prize, $40.00 in Cash - 4th Prize, $25.00 in Cash
5th to 9th Prizes, each $10.00 in Cash.

Herewith will be found the picture of a stylishly dressed lady. Around her figure are concealed the faces of her seven daughters. Can you find their seven faces? If so, mark the faces with an X. Cut out the picture and send it to us, together with a slip of paper on which you have written the words, 'I have found the seven faces and marked them.'

Write the above words plainly and neatly, as in case of ties, both writing and neatness will be considered in this contest. Should you not happen to be a neat writer, point out this advertisement to some friend of yours who can write plainly and neatly, and have him or her enter this contest in his or her name for you. First, agree with the person who is to do the writing, that you are to receive any prize money or prize that may be awarded. This may take up a little of your time, but as there is TWO HUNDRED DOLLARS in cash and One Thousand premiums given away, it is worth your time to take a little trouble over this matter.

Remember, all you have to do is to mark the faces, cut out the picture, and write on a separate piece of paper the words, "I have found the seven faces and marked them."

We do not ask You to Spend One Cent of Your Money in order to enter this Contest.

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over One Thousand Dollars in Cash Prizes from us, and full particulars of a simple and easy condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of Cash Prizes in our late competitions will not be allowed to enter this Contest.

Below will be found the names and addresses of a few persons who have won some of our larger prizes in recent contests. Your opportunity to win a good round sum is equally as good as that of anyone else, **as all previous winners of cash prizes are debarred from entering this contest.**

BOVEL MANUFACTURING CO.

BOVEL BUILDING, MONTREAL, CANADA.

A Convincing Argument.

A Pair of Cattle Gained 550 Pounds in 34 Days.

ON October 7th last, L. C. Prime Company, Limited purchased from Nova Scotia a pair of cattle which were in fairly good condition weighing respectively 1465 and 1585 pounds each. These animals were purchased for making a test of **MOLASSINE MEAL.** They were stabled for thirty-four days and fed on one pint Corn Meal mixed with two pints Molassine Meal three times a day. On November 10th the animals were again weighed and tipped the scales at 1745 and 1855 pounds each, making a total gain of 550 pounds. They were sold to Mr. M. J. Collins, Fairville, New Brunswick. A copy of a letter from this gentleman is published below.

We do not propose to say anything further with reference to the quality of **MOLASSINE MEAL,** as this is conclusive proof that Molassine Meal is the best food on the market for fattening purposes.

The price is low, especially as compared with other feeds at the present time.

FARMERS! Is This Not Interesting to You? Let Us Hear From You.

If you wish to try a bag of this Molassine Meal and your grocer or nearest general store cannot supply you, we will see that it is delivered to you. **MOLASSINE MEAL is made in England.**

We can furnish you with the names of a great many satisfied customers and will be pleased to hear from any farmer with reference to it.

L. C. Prime Co. Ltd., St. John, N. B.

Letter From Mr. M. J. Collins.

Fairville, N. B., Nov. 15th, 1911.

Messrs. L. C. Prime Co., Ltd.,
South Wharf,
St. John, N. B.

Dear Sirs:—

"The pair of Cattle purchased from you were knocked down the first of the week and I am now writing to inform you that we have never handled better Beef. This Beef was equal to anything coming from the West and weighed when dressed 2185 pounds."

"I can honestly say that I know of nothing that is equal to Molassine Meal for bringing Live Stock into good condition quickly."

Yours truly,
(Signed) M. J. Collins.

time of their application, that are evanescent, and their odour, on which they depend for deterring the "fly," is quickly dissipated. As they are non-poisonous, and do not remain long in the wool, they do not poison the "maggots."—Pateley Bridge.

Selecting Breeding Hogs.

In selecting breeding animals I devote particular attention to securing sturdy, straight limbs and strong, upright feet, upon which the pigs are able to stand squarely and steadily. We must avoid pigs with long, slender legs, small weak pasterns and those that fail to carry the end of the ham well down on the hock.

Good blood is desirable but we should not give up good individuality, and place too much stress upon the fancy points and family names, as long as pork growing is our main object. Constitution, robustness, a large digestive capacity and a true meat making form go to make up a desirable market hog.

Strong arched backs, well sprung ribs, full heart girths, broad shoulders, deep hams and strong feet and legs are all vital points to be observed in building up a herd of useful hogs.

Select large, roomy sows with good length, deep bodies and neat heads, broad between the eyes, medium sized flinty bone, and a large heart girth indicating well developed vital organs and a good constitution. Select the sows from dams of prolific families, kind disposition and good sucklers and when you find a good breeder don't sell her as long as she continues to be a good mother. You would not think of selling one of your best cows that has been a money maker, stick to the good sows in the same way.

When mating I prefer to use a medium sized, compact male. In selecting hogs for pork growing the male had best be of the same breed as the sows and an excellent individual and should be kept in good vigorous breeding condition if good results are to be obtained. It does not pay to allow a few dollars to stand between a good breeding boar and a scrub, for his influence upon forty or fifty litters of pigs amounts to a large amount of money and it is few boars that do not get that number of litters.

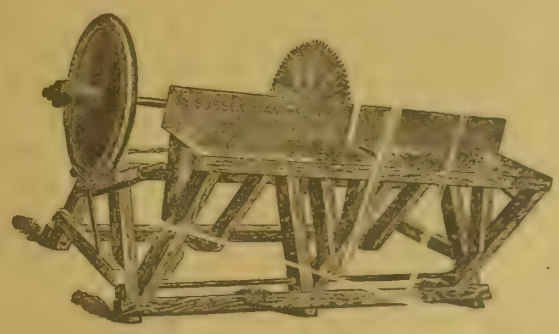
The boar should be selected from some prolific line of breeding and should be strong in every point that goes to make up a profitable market hog. It is a mistake to try cross breeding, better stick to one breed and grade up your herd. When you have used a good boar as long as possible without too close inbreeding buy another of the same breed and keep up the good work of grading up until you have a herd as good for all practical purposes as the pure breds from which the first cross instituted.

Sometimes one cross gives good results, but it is not the proper course to pursue and will in time lead the stock back toward the original scrub or worse; but grading up by the use of good sires is a gradual evolution forward and should not be termed as cross breeding. Success is sure to follow any persistent effort to improve the quality of a common herd of hogs.—L. J. Meredith.

Believes in Deep Plowing.

J. A. Clark, Hazeldean, Ont., says that the new idea of shallow plowing is not giving results, and that the crops are decreasing in yield. We will have to return to the teaching of our fathers and plow deeper, he says, and that the old axiom, "plow deep while sluggards sleep," is as true to-day as ever.

WOOD CUTTERS MADE IN 3 SIZES.



We make the best Wood Cutter on the market. The length of table on our Long Swing is 8 feet, 3 inches; distance between balance wheel and saw 4 feet, 3 inches. Heavy substantial frame and well braced. Steel plate table.

Length of table on Flat Rolling Machine is 8 feet, 3 inches; distance between balance wheel and saw 4 feet 3 inches. The table of this machine moves on grooved rollers and vd. track, which holds the table in position, making it move very easily to and from the saw.

Our Short Swing is built on the same principles as the Long Swing, the arbor and frame is shorter; length of frame 4 feet, 3 inches; distance between balance wheel and saw 3 feet, 6 inches.

On all our machines the arbor is the same size, made of the best turned steel and runs in bearings of the best babbitt. The balance wheel is a solid web and weighs 180 pounds.

We have a large number in stock and can ship promptly. All enquiries will have prompt attention.

The Sussex Manufacturing Co., Limited, Sussex, N. B.

THE HORSE.

Work Better Than Idleness for Stallions.

We have of late received letters asking what may best be done with a stallion that fails to settle his mares. One correspondent submits that his horse shortly after importation contracted a bad case of distemper, and was a long time in recovering. He did recover, however, and then got sick again, later regaining complete health. In the spring he failed to settle his mares, but did quite well in this regard during a short fall season. This year again he is of little use. We are invited to describe the easiest and quickest method by which a cure may be effected in such a case.

Cases of exactly similar sort have come under the notice of the writer in his personal experience and likewise have been drawn to his attention by others seeking counsel. The disappearance of the spermatozoa from the life-giving fluid, their subsequent return and second retirement nevertheless complicates the case somewhat. While the recurring disappearance may not be a bad sign, it is certainly not a favorable one.

Without going too deeply into the subject, the absence of the spermatozoa from the fluid proves that they are not being developed in the seminiferous tubules of the testes. Just what condition has stopped their production cannot be told at long range. A skillful veterinarian should be able to determine the cause after an exhaustive examination. However, no matter what the active, local cause may be, it is probable that there is only one way in which the stallion may be brought back to fruitfulness. That lone way is to put him in the harness and work him just like any other farm horse.

Horses to gain the greatest degree of productivity must be in the best possible bodily health. That condition can only be obtained through constant judicious and rather hard work in the harness every day. This horse proved his possession of a high degree of potency, became entirely barren, regained his potency and then lost it again. Both lapses may in all probability be traced to one and the same cause. That cause, again, is likely the severe attack of distemper through which he passed. If after his recovery from the first attack he had been put to work it is far from likely that he would ever again have failed to settle his mares, once he had shown his ability to do so. At that time, after he had completely recovered, he should have been put to work, gradually toughened into the labor, and then worked moderately hard until every tissue of his body subject to wastage and repair had been changed over and altogether rebuilt. This having been accomplished, no trace of the disease would have been left with him. His organs would have been made sound—granting that such progress was possible—and continued labor in the leather would have been and remained all the treatment he required.

Now, the only thing to be done, provided the stallion seems to be in rugged health, is to break him and put him to work. Exercising in a light rig will not do. Work in which he must exert his muscles, sometimes to their full capacity, is required. The process of toughening him into work in the field and on the road must, of course, be a mighty gradual process. A stallion is never a hard beast to break, for the reason that he is generally unafraid. Naturally it will require a skillful, firm hand to guide him, but such hands may be had—indeed, must be had in this instance, because the horse is no account as he is, and there is no other method from which a thorough and radical cure may be expected. He should not be allowed to serve a mare for a year. He should be kept in a stall where he can have the companionship of the people about the farm and hear and see the other horses. If he is secluded he will get into all sorts of bad habits. He must be watched closely, and, if found to be abusing himself, remedial measures must be taken promptly. However, it will be found that as soon as he is broken to work and comes in nightly tired from doing his daily stunt in the leather, he will be content enough to rest and recuperate without bothering greatly about his productive organs or abilities. It will be worse than ever to shut him away off by himself when in the stable. Solitary confinement and vice go together always with entire horses.

Then the matter of feeding comes up for discussion. If the horse is condemned to a life of idleness and loneliness such as he must undergo if incarcerated even in a large paddock well out of the way of human companionship, it is generally quite a hard job to feed him so that his health remains at concert pitch. On the contrary, when he is worked it makes very little difference what he is fed so long as the hay and forage are sound, fresh, and sweet, the quantity not too great, yet great enough, and no sudden and violent change is made in the substances fed. Horses working every day up to about their maximum capacity are invariably the most healthy, and will eat and assimilate and thrive on a variety of foods that would not do at all as maintenance rations for idle animals. A stallion working every day need have no food different from that which is given the other work animals, so long as he gets enough of it to repair the daily wastage of his system.

Preferably oats, a little corn and a little bran, the proportions arranged as the horse is found to do best, form the ideal ration. Carrots in quantities not exceeding seven pounds per day are usually relished by horses, and may be fed with advantage. Larger quantities of green grass, alfalfa, fodder or the like should be avoided in feeding all working horses. The feeding of bran mashes is at times proper, but as a rule it is deleterious to mix hard and soft food in the daily ration. "The Saturday night mash" has been productive of much death among horses. Find out the foods on which the horse works best, going mighty slow in making any change or addition, and then hew religiously to the line indicated. However, only the eye of the feeder can determine on what foods any horse should be fed.

Instances are plentiful enough of stallions having been rescued from a state of apparent impotency by the treatment outlined. We have known of stallions being seemingly of no reproductive use at all the first year after importation, or even the second, yet recover without any special treatment. In such instances their return to potency came in spite of the care taken of them, not because of it. Work is the great panacea for all the ills that beset entire horses. Medication must by times be resorted to in order to combat or offset attacks of disease or their results, but in the grand majority of cases work is the best remedy after the necessity for the veterinarian's attendance has passed.—J. H. S. Johnstone, in Live Stock World.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR:—I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR:—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.
Hillsboro, N. S.

MESSRS FRASER THORNTON & CO., Cookshire, Que.

GENTLEMEN:—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASER THORNTON & CO., Cookshire, Que.

DEAR SIRS:—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

Mrs. A. R. Tabor, of Crider, Mo., had been troubled with sick headache for about five years, when she began taking Chamberlain's Tablets. She has taken two bottles of them and they have cured her. Sick headache is caused by a disordered stomach for which these tablets are especially intended. Try them, get well and stay well. Sold by all Dealers.

Erythema.

A Subscriber:—I would like to ask a question regarding a young five-year-old mare. She tries to gnaw the back part of her legs and ankles and there seems to be a yellow scruff in the hair next to the skin. I never had any experience with grease but am afraid that is what it is. Is there any cure for it? If so please prescribe through your valuable paper.

Erythema is the name applied to this disease but different names are applied to varying stages and cooditions of the disease. Neurosis being the name applied when there is only functional nervous affection without any appreciable change in nerve structure. When it advances to have small pimples or popules which may vary in size from that of a millet seed to a large bean it is recognised as Eczema. These pimples may form blisters and the rubbing causes them to break when they are called Pustules. We will consider this case as Erythema.

Causes are many. Chilling when the legs are clipped, irritation from salt at times applied to icy streets, filthy, slushy yards or roads, in the western provinces Alkaline mud surrounding ponds, a delebated state of the general system often induced by bringing an animal in from pasture and stabling in a badly ventilated stable and depriving it of frequent exercise also feeding too heating a ration as corn, wheat and buckwheat, foods that should be fed in very small quantities if at all to animals having a tendency to swelling in the legs (stocking).

An animal having Erythema, in any stage, should not be allowed corn, wheat or buckwheat at all. Washing the legs frequently but not properly drying them after washing and the application of irritating liniments or lotions containing oil of turpentine or other essential oils or rancid fats. Urine or liquid feces by splattering on the heels when dropping on solid floor may produce it and it occurs when the hair is being shed as the hair folicles and general surface is then exposed and irritable.

If due to a local irritant the removal of the cause may be all that will be necessary to affect a cure. But when the feeding or system is at fault these conditions must be corrected. A purgative will be useful, from 6 to 10 drams of Borbadors Aloes, quantity to be regulated by size and age of animal. Old animals as well as large ones require larger doses than small or younger ones. About four drams of Ginger should be added to the Aloes which may be given in the form of a ball or as a drench. The animal should be prepared for the physic by being restricted to a wheat bran mash and water only for 10 or 12 hours before administering and for 24 hours after when hay and grain, oats, should be given in reasonable quantities, gradually increased until enough is given to nourish the animal according to work required. Twenty-four hours after the physic was given give 2 to 3 drams of nitrate of potash in food, boiled oats and bran, night and morning, for 4 days then from 1 to 1½ ounces of Fowler's solution of arsenic, once a day, in food.

Exercise daily, preferably twice a day, after the physic operates. While operating keep animal quiet. Wash the part affected with warm water, in a place where the wind does not strike the legs; dry well and apply a weak solution of salt water, half an ounce of salt to one quart of warm water or use sugar of lead, one ounce; sulphate of zinc, six drams and one quart cold water, applying once in 3 or 4 days. If weather is cold use sagar of lead, one dram; opium, one dram and vasaline, two ounces; mix well. Creolin, half an ounce; sugar of lead, half an ounce and raw linseed oil, one pint, applying once every 3 or 4 days may also be used. There are many other remedies but these are generally convenient and effective.—J. Standish, V. S.

Feeding the Working Horse.

In a bulletin recently published by the Wisconsin Experiment Station there appears a contribution on the above subject from J. Z. McLay, of Janesville, Wis. Among other things Mr. McLay says that approximately 10 pounds of oats, five pounds of corn and three pounds of bran, divided into three equal feeds, make a day's ration that can not be improved on for the work horse. The relative amount of corn can well be increased during the winter months, and for sake of variety it may be omitted at the morning meal and fed at noon. The weight fed at each meal should be kept about the same and for the evening meal crushed oats should, when possible, be substituted for the whole grain, along with the bran and a few handfuls of cut hay, fed wet and salted enough to render it palatable. Horses soon become very fond of this food and this alone aids digestion. Sixteen pounds would be a fair amount of hay per day, the larger portion, of course, being consumed at night. Would prefer clover hay if in perfect condition. The reason clover hay is in bad repute for feeding work horses, we think, is because horses are allowed altogether too much of it, they come fond of it. Some advocate the omitting of the evening meal entirely, claiming that the grain fed is forced along the digestive tract too fast to be properly assimilated. While this might do very well with horses on light work, we would scarcely have the heart to withhold the grain ration entirely, but would certainly decrease it. While some well-known authorities advise the using of more barley as a ration, we are satisfied that it is of so little value as not to be worth considering. Fed in any form in considerable quantities, we have found it more irritating to the blood than corn and seemingly to have an especially irritating effect on the skin, and when fed unground exceedingly liable to cause intestinal irritation. The only way we would allow it fed would be on Saturday nights, well boiled and mixed with an equal bulk of bran while hot, and this only during the winter months, when grass is not available. As to the feeding of idle work horses, it would be well if we would dispose of this subject by saying there should never be any, for this undoubtedly is the hardest treatment the work horse gets—the occasional rest when kept absolutely idle, tied to a manger, with all the fodder before him he can consume. Never allow the idle horse to remain in the stable, but see to it that he has a pasture or yard to exercise in part of every day, winter and summer, of course materially cutting down the amount of grain and using more succulent food, if possible.

Laying Hens Are Money Makers

WE GUARANTEE

that by the use of Pratts Poultry Regulator you can have plenty of eggs even when prices are highest and busy hens pay big. A small dose of Pratts Poultry Regulator added to the feed will put more money in your pocket. Try

Pratts Poultry Regulator

on all your hens. Or if you want to make a more careful test, give it to a few for a month, then compare results. Pratts Poultry Regulator doubles the nutritive value of the feed by keeping the digestion in perfect condition.

POULTRY.

Trussing and Boning.

The Agricultural Experiment Station at Ames, Iowa, has issued Bulletin 125 on Trussing and Boning Chickens for Fancy Trade. The Bulletin is by William A. Lippincott, and is so completely illustrated that the following from it without the pictures does not do the bulletin justice but gives some idea of the operations:

"A chicken sold on the general market as dressed has been killed, bled and picked. To be in the best condition for keeping it should be killed by piercing the brain with a sharp knife, bled through the mouth by severing the jugular vein, and dry picked. It is now ready to be transformed from common chicken into an extra fancy product that often retails as high as 50 cents a pound.

"The first thing to do in bringing about this transformation is to singe off the hair-like feathers that cannot be plucked. Wood alcohol makes a good flame for this purpose. It is smokeless and does not give the meat any taint or odor. Be careful not to sear the skin.

Next remove the tendons that run up the drumstick and persist in getting in the teeth when it is eaten. Insert the knife close to the shank bone. Pass the knife all the way up and down between the hock joint and the foot. In the incision thus made slip a hook; a bent nail will do. The beginner will find it easier to remove the tendons one at a time instead of all together. They are easily distinguished and separated. Give a steady pull and they will come out readily. This leaves the drum stick much more tender and palatable, and as desirable as the other parts.

"Having removed the tendons from both legs the shanks should be cut off at the hock joint. If about half an inch of the yellow shank skin is left the meat is not nearly so likely to slide up the bone as it generally does when roasted. This makes the bird appear much more attractive on the table. In marketing fancy poultry products an attractive appearance often makes a marked difference in the selling price.

"To remove the neck make an incision in the skin at the point on the back of the neck where it joins the body. Cut the skin along and then loosen from the neck. Next cut off the neck itself, but do not cut the skin. This leaves the head attached to the body by the skin to be taken care of in a later operation.

"Now slip the knife down close to the base of the neck. Cut it on both sides and then across the top. If the ligaments surrounding the neck are carefully cut it can be easily pulled off. If an attempt is made to pry the neck off without properly cutting the ligaments a broken knife is likely to result. Having removed the neck, loosen the crop and gullet from the gizzard and also pull out the wind pipe and remove the head.

"Now place the bird on its rump, fold back the loose skin of the neck, scrape the wish bone bare and pass the knife blade under it. Do the same on the other side, loosening the bone from the shoulder in each case. The more thorough the scraping the easier it is to lift out the bone and the cleaner it leaves the bone. This is important because a great many people have considerable sentiment about the wish-bone and desire to keep it. It should always be wrapped up and sent with the bird when sold.

"Then pass the finger along the wish bone and free it from the meat and lift it out.

"A great many more slices of breast meat may be carved off without striking the bone when the wish bone is out of the way. This adds far more to the attractiveness of the bird than one would suppose before trying it. It also makes possible the drawing of the bird in such a manner that the bird is not torn and the dressing is held in much better shape.

"The bird is now ready for drawing. The heart, lungs and liver can be reached easily from the front. Insert the point of the blade by the side of the vent and cut entirely around it, making the smallest hole possible. Then insert the finger and loosen the intestines and draw them out. They will break off at the gizzard if they are properly loosened. If they are not carefully loosened before drawing they are likely to break several times and allow considerable fecal matter to escape into the body cavity.

"The gizzard can then be pushed out the front way. It avoids unsightly tearing at the back. Be sure to remove the oil sack from the base of tail.

"All that remains to put the bird into condition as an extra fancy roasting bird is to cut a couple of slits in the skin of the abdomen and insert the drum sticks and to fold the loose skin of the neck up over the back and lock the wings over it.

"If it is desired to bone the bird it is unnecessary to go through any of the latter operations. Take the bird as it is after the removal of the wish bone and turn back the skin over the wing. Slip the knife blade in and dislocate the wing from the body, being careful not to cut the skin. As in the case of the neck, the wing loosens easily when all the cords binding it are cut.

"After dislocating the second wing in the same manner, stand the bird on its rump and proceed to cut the flesh from the ribs and back. Instead of skinning the bird, simply cut the flesh away along the skin, being careful not to cut or break the latter. If the skin is cut it allows some of the dressing to escape and spoils the appearance of the finished bird. In case of a slip the cut or tear should be neatly sewed together with white linen thread. This can often be done so that the opening shows very little. It holds as well as coarse string and looks very much better to the customer.

"When the hip joint is reached grasp the leg firmly in the right hand and dislocate it by twisting. This does not require much strength. There is a certain knack about it that can easily be acquired by a little practice. Care should be taken not to grasp the drum stick in such a way as to bruise the flesh or rub the skin. Bruises are unsightly and make the carcass keep poorly.

"Having dislocated both legs, continue to carefully cut away the flesh from the bones surrounding the body cavity until they are all uncovered. Cut a small hole around the vent. The back ribs and keel containing the entrails and giblets may now be easily slipped out. This leaves only the wing bones, drum sticks and thighs.

"It is then a small job to get the bones from thigh and wing. The wing is cut off at the last joint, as there is not meat enough on the rest of it to pay for the trouble of saving it. The rest of the wing bones and the drum stick are worked out by turning the skin and flesh inside out like the finger of a glove.

"The boned bird should be stuffed and roasted and served just as the trussed bird would be. A pigeon, prairie chicken or even a second chicken cut up and included in the dressing adds greatly to its palatability.

"With the boned bird it is possible to cut slices of chicken which include light and dark meat and dressing.

"Turkeys and guineas may be boned as readily as chicken. Ducks are a little more difficult, particularly if they are very fat."

The Moncton Poultry Show.

The fourth Annual Poultry Show held under the auspices of the Westmorland Poultry and Pet Stock Association was held at Moncton, N. B. on the 10th to 13th inst.

Despite the severe weather the show which was as usual highly creditable to the Association and its various exhibitors was well attended. The number of exhibits exceeded that of a year ago by at least twenty-five percent with a marked improvement in point of quality. Mr. Seth Jones, the Provincial Government expert, in the course of his remarks at the formal opening stated that the Show was fully three hundred percent ahead of the first exhibition held by the Association.

J. V. Jackson, President of the Association, was at the helm directing affairs. His Worship Mayor Reilly of Moncton gave the Association some words of encouragement and the citizens of Moncton some good advice re the value of exhibitions and the citizens' duty in attending them. Mr. Geo. Robertson, of Ottawa, the well-known poultry expert placed the awards and Mr. Seth Jones gave some interesting talks on various phases of poultry lore.

Mr. C. W. Osborne, Mount Pleasant Poultry Yards, Penobsquis, made a fine display of dressed chickens which were much admired. The display consisted of fifty birds, beautifully dressed, and weighing from four to seven pounds each. They found ready sale at 25 cents per pound.

One of the pleasant functions in connection with the show was the Banquet tendered by the Association to Judges Robertson and Jones.

A Correction.

In our report of the Maritime Winter Fair, Mr. A. C. Reid's address was inadvertedly given as Tignish, P. E. I. instead of Tidnish, N. S. Mr. Reid had the best White Wyandottes at the Fair and was successful with them in capturing the Silver Cup donated by the late W. T. Pipes for the best cock, hen, cockerel and pullet in the American Breeds; the Silver Cup donated by E. N. Rhodes, M. P. for the best two cockerels and best two pullets in the utility class, as well as a score of cash prizes and other Specials.

Pointers for Poultry Fatteners.

The following pointers for poultry fatteners are taken from Bulletin 25 of the Department of Agricultural, Saskatchewan, Canada. The bulletin is by W. A. Wilson and is entitled "Fleshing chickens for market." It contains much of interest for the poultry fattener:

Birds of the utility breeds are easily fattened and are in demand by the general trade. They should weigh from 3 to 3½ pounds when put into the feeding crate.

The egg laying strains are not suitable for fattening.

The most profitable period for fattening is from three to four weeks.

Be careful not to overfeed chickens the first week. Feed lightly and remove any feed left in the trough half an hour after feeding. Keep the troughs clean and sweet.

After the first week give chickens all they will eat, regularly twice a day.

The oats or mash must be ground very fine. Oats ground for horse feed are not suitable.

Feeding milk or buttermilk whitens the flesh, which is desirable.

Put a little salt in the feed.

Give water in the troughs twice a day.

Give some form of grit twice a week. Sifted gravel will do.

Feed tallow during the last ten days. Begin with one pound per day to 70 or 100 chickens and increase to

Send your order without delay and share in this bargain carnival. We anticipate hustling, bustling busy days, and we're in fine fettle to meet the rush satisfactorily.

EVERY REBUY REBUILDER IS NOT SATISFIED

ICK BUYING

one pound to 50 to 70 chickens.

To prepare tallow: Weigh quantity required for three days, melt it, and thicken, while hot, with ground oats. Mix one-sixth of this paste with the morning and one-sixth with the evening feed.

If a chicken gets off its feed, remove it from the fattening pen for a few days, allowing it to run free.

Do not allow any food for thirty-six hours before killing.

Kill chickens by dislocating the neck or by bleeding in the roof of the mouth. Use care so that no outside blemish is made.

Market birds with heads and feet on.

Dry pluck at once, while the bird is warm. Observe the buyer's wishes as to whether the bird should be stripped of all feathers or a rim left on the first wing and leg joints. Leave about two inches of feathers around the neck.

As soon as plucked, place the chicken in the shaping board to give it a compact, square appearance.

Chickens should not be drawn.

When cold, wrap in clean parchment paper, and pack tightly in shipping case to prevent injury by knocking about.

See that chickens, paper and cases are kept perfectly clean.

Love's Barrier.

(Continued from last issue).

CHAPTER XVI.

ABOUT AUDREY.

"Mrs. Secretan gives herself a good many airs, Geoffrey, but I can't afford to quarrel with her."

Mrs. Hayes spoke these words rather snappishly, as if she regretted the circumstances which rendered a quarrel with the Rector's wife unadvisable.

"Airs, Maria! I can't say I've seen them," replied her husband perplexedly, as he endeavoured to bring the ends of his tie just right for the neat bow he aimed at. "She seems always the same to me—quiet, unassuming and a lady to the tips of her fingers."

"Oh, of course she is like that to men," said Mrs. Hayes, with a slight, cold emphasis. "I've seen her perk up and smile like anything when you speak to her, and I consider that she flirted something disgraceful with that old Sir Anthony at the Mardocks' garden party. A Rector's wife ought to set a very different example. And Audrey so fond of her! It's a perfect infatuation. I'm always at her about it."

"At her about it, Maria!" repeated Hayes, a trifle nettled. "What in the world should you be at her about it? I am only too thankful to think that she has such a friend in Mrs. Secretan. She needed her. There are not so many girls of her own kind in this neighbourhood. I should have thought, now, that you would have been glad to see the child happy, running to and fro to the Rectory."

"Audrey hasn't much common sense. When she is fond of people like that, she simply sets them on a pinnacle and worships them; she was just like it with the Rector before she came. But there, we can't alter folks, though I often wish Audrey were just a little different. She doesn't help me much."

Geoffrey Hayes put down his hair-brush, and looked at his wife with much amazement.

"Why, Maria, what's the matter with the child? I wouldn't have her altered one little bit. She's—she's—but there! She's my own little girl, and the sunshine of my life, and I wonder to hear you."

It was not often that the master of High Ridges let himself go like this before his wife. At home he was a very mild man, though in the realm of business he was accounted both shrewd and keen; both as master and friend, however, he was a general favourite. He had small quarter, it is true, for idleness or vicious qualities, but he was a just man, and beneath a somewhat reserved exterior hid an uncommonly tender heart. In his married life he had undoubtedly lacked that sympathy which is the core of happiness. But he had never made a complaint, only all his affection had been lavished on his only child, who returned it to the full. It hurt him even to listen to the semblance of blame being cast upon her.

"I'm not finding any serious fault with the child, Geoffrey, so don't get into a bad temper about nothing. I'm only stating facts, cold facts, but there are people seemingly that don't like them."

"Well, and what do you want to be after now you have stated the cold facts?"

"I think we haven't done enough for Audrey. She's nineteen now, and she hasn't come out properly yet. She hasn't really had a chance to get to know people properly, and we ought to do something more for her."

"Well, give a big garden party, Maria, before we go off to Marienbad, and give her the chance to see more people," he said, with a twinkle in his eye. "Though I don't think the prospect of it will fill the child with any lively delight."

"She's like you, Geoffrey; she has no sociable instincts. She only likes a few people, and I should just, one day, for the fun of the thing, like to get her to make out a list for her own party. It would be a queer one, I promise you. Probably Ann Coyne and Lydia Rash would head the list. She'd liefer any day I gave a tea to the Girls' Club than have a decent dinner party. What I'm troubling about is that she doesn't get a chance to meet—well, to meet the people among whom she might make a marriage that would please us."

"That would please you, you mean, Maria," said Hayes bluntly. "I don't want the child to marry, I assure you. High Ridges without her would be inconceivable."

"Well, but she must marry, Geoffrey. She won't always have us, remember, and with her looks she might get in anywhere."

"But I don't want her to get in anywhere. I've seen enough of folks trying to push themselves out of their sphere. If Audrey were to fancy a good, honest, hard-working fellow that would make her happy, I shouldn't worry myself about his position. It's happiness that child wants, not empty titles or belongings, and I mean that she shall be happy if I can manage it."

"But, Geoffrey, it is quite possible to get happiness and position, too," said his wife, trying to speak amicably and persuasively. "The Duchess admires her very much, and thinks she could aspire to anything."

"Did she tell you that?"

"Well, she didn't, but I heard it in a roundabout way."

"Well, what have you up your sleeve, Maria?" said Hayes, with much good humour. "Out with it, and let's get down to breakfast. If it's a garden party, and you can get the Duchess to come—well, I'm willing to pay the piper."

"No, no; I wasn't thinking of that at all. A garden party is a sort of social dust-heap, really. It wouldn't help anybody or anything along. Audrey ought to be presented at Court. She shall be next spring, in March, if I can accomplish it. I'm wondering whether the Duchess would present her."

"I should think she doesn't attend any more on Court functions, if she ever did."

"If she ever did!" repeated Mrs. Hayes scoffingly. "Why, her position gives her the entry. They can't keep her out if they wanted to. She was very kind and affable to me at the garden party, though she hasn't returned my call. But with that sort of people one can't be too fastidious about trifles. What I don't like is that I shall have to get at her first through Mrs. Secretan. They're so intimate, calling each other by their Christian names; it would be much better than writing or trying to see the Duchess for myself."

"I should think Mrs. Secretan would oblige you if she could, and anyway, she would be quite courteous and frank about it. But I won't have the child made cheap, remember, and she wouldn't like it herself. She's perfectly happy as far as I can see, and not troubling her head about Court functions."

"Audrey is a silly little fool, Geoffrey, and if she were left alone, and not watched, nothing would surprise me."

"Well, you can sound Mrs. Secretan, if you like, though the whole thing seems a little unusual."

"Unusual! Why, it's done every day, and I've heard of people even paying large sums to the right people to bring their daughters out."

"You won't catch me doing anything of the sort, Maria. I don't want the child to 'come out' in the sense you understand it. You never came out, my mother never did, and I haven't had any fault to find with the way you conduct yourself, though we don't always agree on the main points."

"Geoffrey, you are very tiresome," said his wife, with a resigned air; "and for a man of your means, I never saw one with less ambition."

"'Fling away ambition: by that sin fell the angels,'" quoted Hayes lightly, being in his leisure moments a student of Shakespeare. "Well, having had my morning tea, so to speak, can I go down to breakfast, and won't you smooth out your face and give me a decent kiss, eh, Maria?"

Often his whimsical humour flashed out like this at moments the most inopportune. In spite of herself, Mrs. Hayes was obliged to smile.

"Oh, I say," he cried, looking back from the door, "John Ridd will be out to dinner this evening. I told you, I think, that he was going over to Canada on some very important business, and I want to show him this little attention before he goes."

Mrs. Hayes did not look pleased.

"I think I shall suggest, then, that Audrey should go and spend the evening with Mrs. Secretan. The brougham can fetch her at nine o'clock."

"Why should you do that, Maria? I want John Ridd to see Audrey, and see her he shall."

"It isn't quite safe, Geoffrey. He admires her very much, you see, and we allowed them far too much scope last August, when we were at Scarborough. Surely to goodness you don't think that John Ridd would be good enough for Audrey?"

"Well, why not? She might do worse, I tell you. Ridd is a very fine young man, Maria, and he's going to be a partner one of these days. There are very few men I'd give Audrey to with better heart, if I must give her to somebody. But that I don't exactly see."

Mrs. Hayes looked unspeakable things.

"Who are the Ridds, anyway? It is true, I believe, that his father was only a gatekeeper at the Howorth Mills, and they educated him out of his sphere. I think he is an upsetting youth, and that you might have found a more suitable representative to send out to Canada."

"I think we know our business, Maria," said Geoffrey Hayes dryly. "And I hope you'l, have an extra good dinner to-night, and see that Audrey wears a pretty frock. Can't you see for yourself, my woman, that we can't help these things. There will be a destiny for her somewhere, I don't doubt."

"Folks make destiny for themselves," she retorted sharply, and made no promise.

The cloud disappeared, however, from both their faces at the breakfast table, where Audrey dispensed the sun. She was so gay and so winsome, so brimful of the joy of life, that somehow unpleasant things could not live where she was. Immediately after breakfast she coaxed her father round the green-houses, though he kept telling her he ought to be off to business.

"You don't want particularly to marry and leave your old dad, do you, Kitten?" he said quite suddenly as they emerged from one of the houses upon the sunny path through the walled garden.

Audrey stood still and laughed.

"Mamma's been saying something," she said comically. "No, I don't want to marry anybody, darling. I want to stay here with you for ever and ever. Dear daddy, do try and persuade mamma to let me have the Girls' Club up for a long Saturday, and to ask Mrs. Secretan, and dear Miss Jane, and the little Courtney boys. I want to have them so badly, only she won't listen. Mayn't I have them?"

"Yes, certainly, if you wish. When would you like it—this Saturday?"

"That would be the day after to-morrow. No, of course, there would not be time; but before the strawberries are over. Why, baskets of them are going to waste, and they would love it all so much. And I can have a Punch-and-Judy show up from Bradfield, and do just as I like about the games, and no preaching allowed?" She broke off out of breath, and Geoffrey Hayes indulgently smiled and promised that she should have her way. But he prudently did not speak to his wife about it that morning, knowing quite well that John Ridd for dinner would

AFTER DOCTOR'S FAILED

Lydia E. Pinkham's Vegetable Compound Cured Her.

Midgie Station, N. B.—One can hardly believe this as it is not natural, but it was my case. For ten months I suffered from suppression. I had different doctors, tried different medicines, but none helped me. My friends told me I would go into a decline. One day a lady friend told me what your medicine had done for her, so I wrote you for advice and received your reply with pleasure.

I started taking Lydia E. Pinkham's Vegetable Compound, and at the second bottle showed improvement. Now I am regular and never was so well in my life, thanks to Mrs. Pinkham's medicine.

Please publish my letter for the benefit of others.—MRS. JOSIAH W. HICKS, Midgie Station, N. B.

Indian Head, Sask.—Lydia E. Pinkham's Vegetable Compound is indeed a boon to women who suffer from female ills. My health is better now than it has been in my five years of married life and I thank you for the good your advice and medicine have done me. I had spent hundreds of dollars on doctors without receiving any benefit.—MRS. FRANK COOPER, Box 448, Indian Head, Saskatchewan.

The most successful remedy in this country for the cure of all forms of female complaints is Lydia E. Pinkham's Vegetable Compound.

be sufficient cause of offence for one day. He sighed a little as he drove the swift thoroughbred down the hill to the station. He did not like the obligation to exercise a certain amount of diplomacy in his dealing with his wife. But her temper was uncertain, and she could make the whole house wretched for days when she had one of her fits of temper on. Hayes, himself, was a man of peace.

About three o'clock that afternoon Mrs. Hayes drove into Midcar in the open Victoria drawn by her smartest pair. She did not ask Audrey to accompany her, nor was the child disappointed. She had asked some of the cottagers' children on the estate to tea in the barn, and her hands were full.

Mrs. Hayes found the Rector's wife at home, busy, indeed, in the garden, to which she had lately given much of her attention. The little cosy house was now as nearly perfect as a house could be.

Helen, to whom six months of matrimony seemed to have imparted a more gracious charm, wore a simple gown of blue linen, embroidered in white by her own clever fingers. She had no hat on her head. Her glorious hair caught the sunlight in every mesh of it, and she had the loveliest, most delicate colour in her face. She was certainly a very pretty woman, and had an air of unusual distinction which caused in Mrs. Hayes a sudden discontent with her own expensive clothes. A few shillings would have paid for Mrs. Secretan's gown, yet it was something decidedly out of the common. Helen heard the jingling of the bells on the harness, and came forward to the open French window of the study, where she saw the figure of Mrs. Hayes. There was a little dismay in her eyes, because she was alone to entertain her, and because Audrey was not with her mother.

But she greeted her pleasantly enough. Time was when Helen would have had no qualm about being "not at home" to Mrs. Hayes, but something in the new life was teaching her that sweet, fine consideration for others which she saw exemplified daily in her sister-in-law's life, and in a less degree in her husband's. These six months had begun to work a slow but very gracious miracle in the heart of Helen Secretan, and she was happier than she had ever been in her life, or than she believed it possible for a human being to be. It was a strong, deep, secure happiness, built on the foundations of peace.

"Audrey did not come?" she said, with a smile, as she shook hands quite cordially with her visitor.

"No; she has a tribe of children to a barn-tea this afternoon, and I was glad of it. I rather wanted to have a nice little private talk with you. Is the Rector at home?"

"No; he is away in Essex, at my old home, seeing to a little business for me. Would you like tea in the garden, or shall we have it just here on the veranda? I am so proud of the veranda, Mrs. Hayes. Don't you think it a great improvement to the back of the house?"

"Yes, it is, and your house is really very pretty, Mrs. Secretan," said Mrs. Hayes graciously. "I am often saying to Mr. Hayes what changes you have made, and how the Rector must appreciate them."

Helen smiled and rang the bell. When Bates appeared, she asked for tea to be brought at once.

"That is an excellent page-boy. What good manners he has! I suppose he was trained in some big house, and will pass on to be an under-footman soon. If you ever part with him, be sure you let me know."

"Bates has never been in any big house," said Helen amusedly. "He was our greengrocer's boy at Colchester, and I trained him myself. I don't think he has any ambition towards a footman's place; and it is a great comfort to me that he never seems to grow any bigger. Are these not lovely days, and how quickly one forgets the long, cold spring! Did you ever see anything so lovely as the moor just now? I'm afraid I spend a great many idle hours on it."

"Yes, it is very nice indeed. I noticed the colouring as I drove down this afternoon. Will you be going away for a holiday in August?"

"We may just take a week at the sea if we can get away, and if Miss Secretan can be persuaded to accompany us."

"You and Miss Secretan are very good friends. I have always thought her rather a difficult person, though I must say she seems to have done a great deal for Tom Courtney. I hear on every hand that he is a different man. I was only saying the other day to Mr. Hayes what a good thing it would be if he would marry her."

Helen's colour rose, and at the moment Bates appeared to lay the cloth. By the time he had retired again, she had recovered herself.

"Don't you think it would be a good thing for her? The Courtneys are a very good old family—what they call yeomen in the West Riding—and Geoffrey says he is quite well off."

"Did Mr. Hayes think it would be a good thing for my sister-in-law, too?" inquired Helen rather curiously.

"Well—no, he didn't; he said she was far too good for him."

"Well, that's just what I think, Mrs. Hayes," said Helen, with that little touch of hauteur she could so well assume when she wanted to check familiarity or change an unwelcome subject.

"Have you seen the Duchess lately?" inquired Mrs. Hayes, as she took the cup from Helen's hand, incidentally noticing what a beautiful old piece of china it was, and how exquisitely in keeping with all the appointments of the table.

"Yes, I saw her yesterday. She goes off for her annual cure the day after to-morrow."

"Where is she going, do you know?" inquired Mrs. Hayes, with unmistakable eagerness. Helen immediately became evasive.

"She has discovered some new little place in the Vosges mountains, I believe; a place with an unpronounceable name."

"How long will she be gone?"

"About six weeks, I suppose. Then she will go out in the late autumn to her daughter, Lady Lipstoke, whose husband has a ranch in California."

"Then she is not returning to Mardocks for the winter?"

"No, I think not."

"How very sorry everyone will be," said Mrs. Hayes sincerely enough. "May I say something to you about Audrey, Mrs. Secretan?"

(Continued in next issue).

Vigorous Manhood.

Two "Health Belt Men." One 50 Years Old, the Other 30. Can You Pick Out the Younger?

I can show you how to restore your youth and how to keep it. A "Health Belt Man" CANNOT grow old; he must be young forever. Years count for nothing in this life, so long as you have great vitality. Weakness, Nervousness, Unmanliness are conditions to be laughed at by the intelligent user of my great appliance, it gives, in abundance, all that vim, vigor and nerve force which the weakened system craves—Worn every night and all night for two or three months, it sends a great, warm, glowing volume of electricity into your body through the nerve centres at small of back; from the first hour's use you experience a decided benefit; there is a great mysterious force which gets right to work. No drugs to be taken; no conditions imposed except that dissipation must cease. Help nature that much; the Belt will do the rest. It takes the weakness and kink out of your back; it drives rheumatic pains away from all parts of your body, you will feel and look young and strong again; woman and man noticing your physical change will be more attracted toward you on account of your new vitality and life; in two months you can experience the full vigor of perfect manhood, or you need not pay.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

Let Me Send You These Two Books FREE

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature," and deals with various ailments common to both men and women, such as rheumatism, kidney, liver, stomach, bladder, disorders, etc. The other "Strength," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this city, take the time to drop in at my office that you may see, examine and try the Belt. No charge for advice, either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one who needs new vigor.

Nova Scotia Farmers in Annual Convention.

(Continued from page 259).

of pure bred stock were the main supporters of the Halifax exhibition and he thought their efforts should be recognised by the Farmers' Association by going on record in favor of a yearly exhibition.

Mr. Crane, of Grand Pre, concurred with Mr. Pineo's views.

Mr. F. L. Fuller, in reply to Mr. Murray's remarks said it was interesting to watch young animals striving to out-class the so called stand bys. If an old animal was good enough to win over a lot of younger animals it deserved to stand at the head of the class.

Mr. W. M. Woodworth, referred to the holding of local fruit shows as being inadequate to the advertising requirements of the Province. Local fairs were nothing more nor less than local mutual admiration societies.

Mr. Bryan, would like to see the Halifax Exhibition grounds thrown open for use for other legitimate purposes. Such an action would greatly reduce the demands on the maintenance funds. He would like to hear more constructive criticism and less destructive criticism in regard to the fair.

Mr. Merritt, thought lower transportation rates and special trains run to the grounds instead of to the station at Halifax would be a great incentive for people to visit the fair.

Prof. M. Cumming, explained that the grant for the holding of a fall fruit show was at the disposal of the Nova Scotia Fruit Growers' Association. He favored holding the fruit show at Halifax on suitable dates, when the fruit growing possibilities of the Province could be shown to the best possible advantage.

Messrs, Wm. Corning, A. S. McMillan and Wm. O'Brien were appointed a committee to deal with the Exhibition Commissioners' Report.

IMMIGRATION.

Mr. Cutten, of the Provincial Immigration department, was present and stated that he would be pleased to meet and converse with farmers who required hired help or who had farms for sale.

COUNTY REPORTS.

ANNAPOLIS COUNTY.

Mr. L. W. Elliott, reported for his County as follows:—

We have to report a year of great prosperity for Annapolis County. Our Association is fairly successful. Our membership numbers 209.

Institute meetings held, 34, not as many as the year before. Messrs. W. H.Woodworth and L.D. Robinson were the chief speakers on subjects of general interest to the farmer. Mr. J. N. Chute also addressed several meetings on the live subject of Co-operation. Eight societies and five packing houses for the purpose of co-operation in packing and marketing fruit has been organized in our County.

Mr. Mitchell, of the Dairy Department, Ottawa, was to address three meetings, but owing to severe storms only one meeting was held. We hoped to have some meetings in June, but were again disappointed.

In August we held our annual Farmers' Picnic. Prof. Cumming favored us with his presence and words of advise and cheer. The Government Commission for studying our fruit conditions represented by Mr. Bunting, visited our valley at that time, and spoke at this picnic.

Our crops harvested during the year were fairly good—hay and grain not far below the average, roots good, turnips abundant while an en-

INVINCIBLE FENCING

Invincible Fencing, as the product of the largest Canadian Steel Producing Company, represents a standard founded on a determination to merit the Canadian trade by producing Canadian quality, viz.: The quality Canadians want. The best Canadian iron ore converted into the finest, new process, open hearth high carbon steel, by skilled Canadian Steel makers, is made by expert Canadian workmen into Wire, and into Invincible Fencing. Invincible Fencing, in its locks, uprights, and strands has the Grip and tenacity—the "Never-let-go" of a Bulldog, and of the British kind at that.

Edison, the wizard inventor, Graham Bell, of Telephone fame, Jas. J. Hill, the Railroad King, are men of Canadian birth and training. Our Canadians, at home, in the Steel and Wire industry, are equally capable of leading the world. Those who in years past have boasted about their imported Wire should look now at the rusted wrecks of the "Close-wiped" wire fences seen everywhere. The cause? Simple enough; Canada has been the dumping ground for their overplus. Spelter for galvanizing costs about three times as much as steel; so the makers of this imported wire scrape the coating to a mere wash. Invincible Fence is honestly galvanized with a heavy coating under the care and direction of our superintendents, who produce thousands of miles of high grade wire specially for the largest telegraph and telephone companies in Canada. We have for years satisfied their extremely high standards, and we can more than satisfy you.

Ask the railroad and structural engineers, the men who have built the great transcontinentals, the skyscrapers and bridges, about the Bessemer process, and about the new process, the open hearth. They will point to the thousands of lives lost by broken rails, the numerous accidents and loss of property, and tell you that every rail and girder used to-day is of open hearth steel. Why? because first of all there is no haphazard guessing in the new process. The steel is made exactly to the desired analysis. Our open hearth steel is at once stronger, tougher, and purer, and the coat of galvanizing adheres to it more strongly than to the Bessemer.

But do you suppose these old Bessemer steel plants have been discarded? Not at all. The big railways and builders have their chemists, who demand open hearth steel; so the Bessemer steel makers are devoting their attention to wire, and other lines not subject to a strict analysis. What next? Why of course an overplus of cheap Bessemer steel "Skimpy" Galvanized wire. This cheap imported wire is used in many fence factories in Canada.

BEAR IN MIND:

Invincible Fence is made only from the finest new process Open Hearth Steel, well and heavily galvanized. Canadian made, Canadian quality, with a grip and tenacity an invincible unrelaxing "hold fast" like that of a thoroughbred English Bulldog.

Invincible Hot Galvanized Gates are galvanized after made,—100% superior to those done by the cold or electroplating process. Every part is covered heavily. They will last a lifetime. We galvanize these right in our pipe mill which is equipped with an immense galvanizing tank such as no gate maker could afford to use for gates alone. We are large producers of steel pipe and make everything else composing Invincible gates even down to the bolts and nuts. We positively guarantee them superior to any other class of gates heretofore produced. The Fence agency of the Steel Company of Canada is by long odds the best and most desirable line in the Dominion. Fence dealers and those desiring a permanent paying line should write at once.

ADDRESS—THE FENCE DEPARTMENT

ormous crop of exceedingly clean and highly colored apples was gathered. Our success in raising apples may detract from other lines of farming, but we would urge farmers not to neglect the dairy and other live stock industries.

We are glad to know that a number of our young men are taking advantage of the courses at the Agricultural College at Truro.

Our annual meeting was held on the 3rd of January with largest attendance we have ever had. We secured a membership of sixty at that meeting.

We look forward to 1912 as a year of exceptional prosperity.

ANTIGONISH COUNTY

was reported for by Mr. Geo. Vinten, who said:—Although our 1911 crops, in some cases were not quite so good as in 1910, yet prices were good for almost every kind of farm produce, dairy products fetching record prices. On the whole we have nothing to complain of and we have come to the conclusion that there is only one Antigonish County and that a pretty good one.

We, again, held our Seed Fair last March and although we had not quite as many entries the exhibits showed a marked improvement when compared with previous years. The amount paid out in prizes amounting to $125.-50 being $4.25 more than in 1910. In fact we held what was considered by experts to be the best seed fair in the Province of Nova Scotia.

Our Horse Fair was held on the exhibition grounds in May. The entries were smaller than usual except in the class for Clydes.

A number of public meetings were held in different sections of the Country during the year and addresses delivered by C. F. Alward and G. Vinten in the interest of Farmers.

On October 2nd and 3rd we held our Fall Fair. The exhibits were good both as to quality and quantity, especially in the classes for fruit, vegetables and roots. Unfortunately the weather man was out of humor and our attendance was hardly as good as we hoped for, leaving us with a small deficit. We have however built a row of sheds fitted with coops for poultry and have finished our second Exhibition Building which was turned over to the ladies for the Domestic Department and, although, this was their first year, they had the building filled to the limit. I am not sure but we may have to build them a larger building.

CAPE BRETON COUNTY

conditions were reported by R. M. Jackson. They had held 12 institute meetings, during the year which were addressed by Prof. M. Cumming and Messrs. C. F. Alward, C. M. McRae and F. L. Fuller. The result of these meetings is a more general awakening of the farmers to the possibilities within their reach. Not a few of the farmers were getting interested in the question of underdrainage. Their exhibition was growing apace. The number of entries at their first exhibition was 900. Their second exhibition brought out 1400 entries and their third fair, held in the fall of 1911 reached the 2100 mark. Three large tents, costing in the vicinity of $800.00 had been purchased but still the balance was on the right side of the ledger. Prospects are bright for the future of the farming industry in Cape Breton.

CUMBERLAND COUNTY

M. Samuel Freeman, who reported for Cumberland County, said his Association had a membership of 150, had held 30 meetings with an aggregate attendance of 1018. The farmers of Cumberland County were beginning to evidence a lively interest in the work of the Association.

DIGBY COUNTY.

Mr. Seely reported that the Digby County Association has a membership of 60 and that the finances are on a substantial basis.

HANTS COUNTY.

The Hants County report was read by Mr. Merritt:—

Our membership now numbers 155. During the year we have held twenty public meetings, attended by a total of 1,000 people, an average attendance of 50.

The principal speakers have been Messrs. W. H. Hoodworth, Berwick, and C. F. Alward, of Havelock, N. B., one meeting each being given by Messrs. McRae, an Ontario man, Mr. Robinson, of Berwick, and J. P. Landry, of the Government farm, Truro.

The addresses have been excellent ones, and well received by those present. The attendance, while not as large as we could wish, has been fairly good, and will no doubt increase. Those who attend once, always want to come again. It is only those who never attend a farmers' meeting who consider them of no value. The subjects discussed at the meeting were:—spraying, pruning, cultivating of orchards, commercial fertilizers, soil cultivation, care of horses, dairying, seed selection, poultry, etc. The past has been a good year, shall we not make the next a better?

LOSSES BY LIGHTNING.

BARNS BURNED IN DIFFERENT SECTIONS OF THE COUNTRY.

Farmers Lose Live Stock and Crops—Planing Mill at Niagara Falls and Large Stock of Lumber Destroyed—Other Fires

(Special Despatch to The Globe.)

Lindsay, Sept. 15.—A more than ordinary electric storm, doing considerable damage, passed over this section this morning at about 1 o'clock. In the rural districts several barns were destroyed by fire from lightning. Among others the following have been reported: The barn of Nicholas Dee, containing the season's crop, owned by Mrs. Shea, total loss. Two barns, crop and horses belonging to Wm. H. Skuce of Mount

The dwelling house and barns of Mr. Lamb of the township of Verulam are reported destroyed, but no particulars have been received. In the town of Lindsay the storm we

Another Barn Burned.

St. Catharines, Sept. 15.—(Special.)—Lightning struck and set fire to the barn of John Bertram on the townline between Louth and Clinton, about a mile north of Vineland, on Tuesday night. There was a heavy electrical storm in that vicinity and the barn was entirely destroyed, with its contents, including two valuable horses, hay, grain and some implements. Most of the implements happened to be outside the building. Mr. Bertram had recently completed a storage for crops and sheds for threshing, which had just been completed. The loss will be about $1,050 or $2,000. The barn was an old one, but answered the purpose of a storage for crops and sheds for horses.

Blaze at the Falls.

Niagara Falls, Sept. 15.—A barn and outbuildings owned by Mr. Thomas Petch were struck by lightning and consumed, with the season's crops. Loss $4,000, partially insurance.

FLORICULTURE.

A St. John correspondent writes:—Easter Lily has grown well until it has reached a height of three feet, when the lower leaves are turning yellow and falling off.

This may be caused by not giving the plant sufficient water. This plant should never be allowed to get dry, even for a day, as it means a serious check. It is also possible that the bulb may be afflicted with the so called Bermuda disease. In that case the leaves are all more or less effected, being spotted with light spots and ends curling and twisting with lower leaves falling as spoken of. If this should be the case there is little that can be hone. Unless the case is a very bad one, indeed, you will get a few small blooms, probably slightly deformed but better than none. I would not advise throwing it away, unless very badly affected. However if you should have other lillies of the same variety that are perfectly healthy it would be well to isolate the diseased plant as it is liable to spread the infection to the others.

A little care about the presence of earth-worms in the soil of potted plants may save many a fine plant; if exercised at this season of the year. If you see little round lumps of earth on top of the soil in a pot turn the ball carefully and nine times out of ten there will be one or more large worms that have made a comfortable home of your plant by boring the soil and roots full of corridors and chambers that allow the air directly at the roots and this seriously affects the health of the plant. In most cases these pests can readily be drawn out but when they are in the centre of the ball you can generally secure them by holding the ball in the hand and tapping gently on the soil with a stick. This will bring the worm to the outside when it should be seized firmly and slowly drawn from its lair. Slowness should be emphasized in this case as if the worm is broken the section remaining in the earth will soon become as troublesome as the whole worm was.

Many plants were frozen during the late cold snap and frozen wood should be carefully cut out as it is apt to rot back and kill the roots that otherwise might have life enough left to send forth new growth.

If A. B. would send a leaf of the plant that is apparently dying I will try to give the treatment to apply to the case, but I cannot identify the plant by the description given.

H. A. V., writes:—Tell me how to repot my Primroses?

In repotting Primroses and in dividing old plants of this family trim up the bottom leaves closely, if they are a little shaky in the pots. It will not hurt them as they will soon establish themselves. Water very moderately after repotting and keep well shaded for a few days.

Bessie, Oromocto, N. B., writes:—I have received seeds of the Castor Oil Bean. How should I plant them? Would they grow if planted in the ground this fall or should they be planted in the house? Is it better to sow Poppy seeds now or in spring? Would it be too late to sow Grass seed? If not where could good seed for a cemetery lot be procured next spring? I am promised a small root of the hardy Garden Hyderangea. Should it be potted in woods' earth, and how should it be treated during the winter? Can it be kept in the cellar, if a cool one? Carnations keep well in our cellar all winter.

The Castor Oil Bean may be planted in a small pot, well watered and placed in the warmest, sunniest window in the house. It should be repotted as soon as the pot becomes filled with roots and may be planted out of doors in rich soil as soon as all danger of spring frosts is over. They make a very handsome foliage plant if grown in a sunny spot, in very rich soil. Do not plant the beans in the ground in the fall. The middle of April is a good time to start them in the house in pots. By all means sow the Poppy seed early in the spring and have the ground well prepared. They are very apt to come uneven if planted—in the fall. It is too late now to sow Grass seed. Sow Grass seed early in the spring. Lawn Grass seed can be obtained from any seedsman. I am now using in preference to lawn Grass, Kentucky Blue Grass and White Clover, one quarter Clover to three quarters Blue Grass. It makes a fine lawn and winters well about St. John. If you get the hardy Hyderangea after the ground is frozen plant it in a pot, water well and place in cellar, in a dark corner. Get it out of doors early in the spring. Frost will not hurt it. Keep dry during the winter in fact treat as you do your Carnations.

Chemical Analysis of Soil

Extract from

"Artificial Fertilizers; Their Nature and Use"

By B. Leslie Emslie, F.C.S., P.A.S.I., C.D.A.

"At one time it was thought that a chemical analysis of the soil ought to indicate exactly the manurial requirements of that particular field but this theory was very soon upset, when it was observsd that certain rich clay soils, which on analysis showed a very high total potash content, were still benefited by an artificial application of Potash, as proved by the increase in crop production.

Some soils also which analysed high in phosphoric acid, were found to respond readily to an artificial application of an available phosphatic fertilizer.

Now, while a general chemical analysis will show the total amounts of plant food in the soil, it does not show what proportions are available to the plant, so that the quickest way to find out the manurial requirements of a soil is to conduct fertilizer tests on the farm."

Farmers, who have not already done so, should procure a copy of this important bulletin.

Copies of this and other bulletins, treating of the fertilization of various crops, may be had by writing direct to

GERMAN POTASH SYNDICATE,

1106 Temple Building, Toronto, Ont.

Makeup of the Soil.

Farm boys can do no better than to learn accurately just how soil is made and of what different soils is made. Below is a list of questions to answer. See how many of them you can get:

1. Of what is soil composed? What can you offer to support your answer? (Seek your answer in the vicinity of your home or schoolhouse).
2. What have acted upon rocks to reduce them to very fine particles? What evidence can you offer that rocks have been acted upon by what you have named?
3. Are there any gravel pits or banks in your county? What do these tell concerning soil formation?
4. What is humus? What agencies are soil mixers?
5. Try placing a bottle of water outdoors on a cold winter night. Is there any relation between what happens to the bottle and what takes place on the surface of exposed rocks?
6. Have you ever seen a tree growing in a crack in a rock? What effect did the roots of the tree have on the rock?
7. Perhaps you have found pieces of limestone with marks on them that look like roots. How did these markings come to be on the rock?
8. If there is a low, marshy spot on your farm, dig up some of the dirt and note how it differs from the soils on the higher lands. Why this difference? Is the marsh gradually filling up?
9. Notice the bed of a stream and see if you can explain why some soils are composed of large particles and some very fine particles.
10. What is meant by "available" plant food?
11. What part do carbonic acid gas and nitrogen play in making plant food?
12. What plan has Nature for transforming nitrogen into available plant food? Produce a specimen showing that Nature has made provision for such work to be done.
13. In what order have low forms of plants succeeded each other in the soil-forming process?
14. How is plant food removed from the soil? How can it be replac-
?
15. Careful observations will help one to see year by year soil formation processes. What ones can you cite that are not far from your home or school?

The management of the calf during the first year has much to do with its later usefulness. Plenty of water and salt should be given in clean vessels. Avoid sudden changes of diet and practice regularity in feeding. Provide warm, dry quarters in damp weather. Give plenty of roughage and not too much grain so as to develop a large capacity for handling food as is desirable in dairy animals. When the calf is six months to a year old milk may be omitted from its ration and a full roughage and grain diet substituted.—D. H. Otis.

New Brunswick Crop Yields.

Statistics of crop yields as gathered by the Provincial Department of Agriculture show larger yields in all crops but buckwheat. The figures for 1911 and 1910 are as follows:—

	Acres.	Bus.	Bus. per acre
Wheat.....1911	13,226	254,771	19.2
Wheat.....1910	13,988	265,848	19.
Oats.....1911	198,120	5,970,435	30.1
Oats.....1910	196,795	5,847,877	29.7
B. Wheat.1911	55,979	1,173,147	20.9
B. Wheat.1910	656,305	1,390,717	24.6
Potatoes.1911	47,304	3,493,212	179.5
Potatoes.1910	47,744	6,067,276	127.
Turnips...1911	6,473	3,326,793	513.9
Turnips...1910	6,310	3,160,158	500.8

The numbers of Live Stock show decided gains since 1909, though the number of horses for 1911 is slightly less than in 1910. The figures for the three years are as follows:—

	1911	1910	1909
Horses.....	60,329	61,042	57,713
Cattle.....	227,145	215,529	199,481
Sheep.....	150,760	137,489	143,274
Swine.....	91,363	80,022	70,010

The Agricultural Societies in the Province now number an even hundred there having been an increase of 12 during 1911. In 1908 these Societies numbered 58, the increase in the last three years has therefore been 42.

MAKES HENS LAY
MAKES HENS PAY

A CHALLENGE FROM NEBRASKA

D. M. Allan writes: "I am now feeding INTERNATIONAL POULTRY FOOD to my flock of Black Minorca, and I am open for competition against any flock in this or any other State."

1,500 EGGS FROM 30 HENS IN 60 DAYS

"I feed my hens INTERNATIONAL POULTRY FOOD and my 30 hens laid 1,500 eggs in sixty days," says Ira C. Eldridge.

How many eggs are you getting? Think of the money you can make by using INTERNATIONAL POULTRY FOOD. It doubles the number of eggs, by doubling the health of the hens. It keeps fowls in perfect condition—makes them lusty and vigorous—makes them scratch and eat—and lay all winter.

INTERNATIONAL POULTRY FOOD protects fowls against Cholera—in fact, many breeders say that it is the best Chicken Cholera Cure in existence. Price, 25c., 50c. and $1.00. Sold by dealers everywhere.

Write for free copy of our $3,000 Stock Book—of interest to every man who raises horses, cows, sheep, pigs and poultry.

Questions and Anewers.

(Continued from page 255)

same as the electric strain in the cloud pushes toward earth, but the air beneath resists, and the house standing on the earth sticks up through the air, and thus becomes the discharging point for the earth, and in this way the house is charged.

This in your philosophies is called "induction."—the cloud inducing or coaxing a condition or charge into the house. And when the charge between earth and cloud becomes so great, the air can resist no longer, the conditions for lightning are ready and off she goes. Your electrified house flies to pieces, and terror and death is the sequel.

10.—Then before the home is struck are we to understand "the conditions that produced the flash existed already in the house and cloud?"

That is it exactly. As the electricity accumulates in the cloud, it induces an opposite condition of electrification in the house, producing an electric stress between cloud and house. When the charge is big enough it discharges between house and cloud, and the path through the air gets white hot, because the air resists it, and the timbers of the house also being poor conductors, are torn to pieces. But the stove, being a better conductor, and not in metallic connection with the earth, becomes a danger point; it is an easy "way" and your family might get the electric current through the stove if near it. The same is true of the water pipes and screen doors, and tin valleys on your home, and such places should be avoided. Remember, the charge does no harm, it is the discharge that does the mischief. But if there was no heavy charge, there could be no heavy discharge.

11.—Why is a railroad train or steam engine never struck by lightning?

They never get heavily charged with electricity and so the conditions are never right. You see the metal of the train is a good conductor of electricity, and when the cloud attempts to charge the train with electricity the entire electric stress is instantly delivered to the highest point, which is the sharp edges of the funnel, of the engine; there is a continuous silent discharge taking place from the sharp edges of the funnel, and in this way the accumulation is kept down and the conditions for lightning destroyed. This silent discharge is easily seen in the dark and nearly all engineers have seen it during thunder storms in the night time. This is why lightning will not strike a railroad train. If trains were disconnected from earth, as stoves and screen doors and tin valleys are, this would interrupt the silent discharge, and they would be dangerous to stand by.

12.—State again what is necessary to prevent a lightning stroke?

All right. Now listen this time. Lightning is the result of a class of conditions, and cannot possibly occur without these conditions. These conditions are the storage of electric force in the things that are to be struck. When the charge gets big enough, it all goes off at once, and anything that resists this discharge is torn to pieces. Now to prevent the lightning stroke you must not allow the electricity to store up. A railroad train destroys the conditions that cause lightning by discharging the electricity as it accumulates. A house if it is covered on roof and sides with metal, is safe, as it discharges the electricity silently, a little at a time, just as a railroad train does. But on a wooden house you must use good lightning rods, and have them intelligently put on. The rods act as a telegraph line for the electricity; As the rod is in the earth and extends above the house, the electricity finds an easy way through the rod, and instead of storing up in the house, it is telegraphed to the points of the rods and from the points escapes, thus preventing the conditions that otherwise would cause trouble. This discharge is easily seen in the dark. In a nutshell, lightning is caused by electricity storing up in quantity. To prevent it, don't let the electricity store up.

13.—Why are lightning rod points sometimes melted?

The electricity is all trying to escape from the sharp points. If the rod has poor earth connections or has joints, the electricity does not so easily reach the points, but is interrupted through poor conductivity; or if the points are not sharp, the discharge is greatly hindered. This allows too much accumulation in the rod and when the final discharge takes place, it might tear the rod loose from the building. Usually in such cases the ground around the place where the lightning rod enters is blown up, and at the point, the resistance of the air causes such intense heat that the point is melted, and a severe shock is liable to be given the people in the home. A correct lightning rod, correctly put on, properly grounded and sharp pointed, seldom suffers in this way.

The Winners

in 1911 Farmer's Contest, each of whom received

$100 in Cash.

ALBERTA

PRIZE A.—Hays Brothers, Carstairs.
" B.—Tomfohr Brothers, Milk River.
" C.—George Jackson, Cheadle.
" D.—Herbert Elwell, Blackfolds.

MANITOBA

PRIZE A—William Elliott, Silver Plains.
" B.—Mrs. Jonathan Blake, Bradwardine.
" C.—N. Harrap, Woodlands.

What the Prizes Were.

PRIZE "A." $100 given to the farmer in each Province who used during 1911 the greatest number of bags of "CANADA" Cement for actual work done on his farm.

PRIZE "B." $100 given to the farmer in each Province who used "CANADA" Cement on his farm in 1911 for the greatest number of purposes.

PRIZE "C." $100 given to the farmer in each Province who furnished us with a photograph showing best of any particular kind of work done on his farm during 1911 with "CANADA" Cement.

PRIZE "D." $100 given to the farmer in each Province who furnished the best and most complete description of how any particular piece of work shown by photograph sent in was done.

THE contest was successful beyond all expectations. Hundreds of entries were received from all parts of Canada, and their excellence proved beyond question that Canadian farmers are fully aware of concrete's advantages. Arrangements are now being made for the

1912 Contest.

Have you received your free copy of the handsome book,

"What The Farmer Can Do With Concrete?"

If not send your name and address to-day. It will cost you nothing, not even postage.

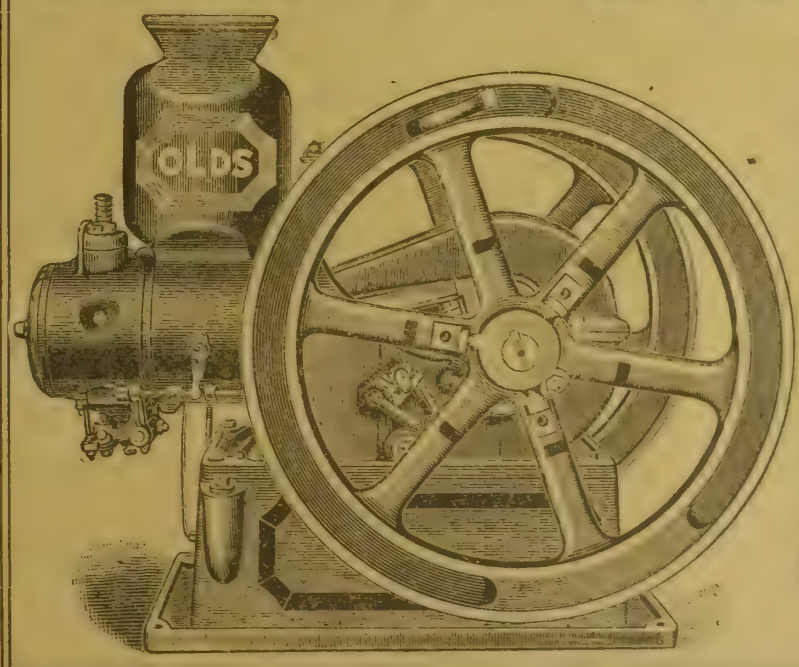
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Load This Wagon To the Fullest Capacity

Every dollar invested in a T-K Handy Farm Wagon will be repaid over and over again in saving work loading and unloading besides this wagon will carry as heavy a load as any pair of horses can draw without tireng them, It earns money for you and makes farm work easier.

T-K Wide Tire, Steel Wheels and Handy Farm Wagons

The success of our Wide-Tire Steel Wheels has been unprecedented in the history of wheel manufacturers. They solve the problem of getting over the worst roads without lightening the load or tiring the horses. Mud won't clog them, bad roads won't injure them. yet they are cheaper than wooden wheels.

FALLING SICKNESS

Fits, Epilepsy, St. Vitus' Dance, Nervous Troubles, Etc., positively cured by LIEBIG'S FIT CURE. We will send trial bottle FREE if you will mention this paper. Write the LIEBIG CO., Spadina Avenue, Toronto.

14.—Do lightning flashes vary in intensity?

Very much indeed. An electric discharge through a very dry atmosphere is exceedingly bright and hot. An electric discharge through an atmosphere with a little humidity is not so hot and varies in color from red to pale. And in very moist atmosphere, such as a fog, there is no lightning at all. So it often occurs, during a storm that lightning will cease after the rain has fallen for an hour or so, and in such cases the air is getting too moist and becomes so good a conductor of electricity that lightning ceases. In a dry climate like Colorado, lightning is terrific, while on the coast, where it rains much, the air gets so damp lightning is rare and mild.

15.—Are all metals equally good for lightning rod purposes?

No; silver is best, but copper is most available. The relative conductivity of metals is as follows: Silver, 136; Copper, 100; Gold, 74; Zinc, 28; Iron and Steel, 16; Tin, 15; Lead, 8. From which it appears that copper is more than six times better than iron as a conductor of electricity.

16.—Why are wire fences so dangerous to stock during a thunderstorm?

Wire fences are not in metallic connection with the earth and cannot well receive and discharge the stored electricity. Animals standing by such fences become the means of connecting the fence to earth electrically, as the posts are poorer conductors than animals. But if the ground wire was put on every fifth post no animals would be killed, as the wire is a better conductor than the animals. To put on this wire you can use a wagon rod to punch a hole two feet deep, stapling the wire to the post so it touches the fence wires. This wire may stick an inch or two above the post. You can protect a pasture of 160 acres for seventy-five cents if you throw in one-half day of your time to do it. Telegraph lines have now such a wire on every fifth pole and damage has almost ceased. Telephone companies as a rule, don't yet know enough and lightning works fearful havoc with their lines.

17.—Where are the most dangerous places in a house without a rod during a thunderstorm?

Near the stove, or the water pipes, or screen doors. If the stove pipe is tall, the stove is probably the most dangerous place, as the pipe will try to be a lightning rod and discharge the electricity through that part of the house. If however, the stove pipe is not tall, other places may be more dangerous; perhaps where the water pipe comes into the cistern. If your house has a wing, look out for the tin valley, in the angles of the roof. If a screen door is beneath the tin valley, it is a very dangerous point to stand in times of severe lightning. In 1882 the writer came within fifteen seconds of eternity while standing in a screen door beneath a tin valley, but left just in time to see the door posts, against which he had been leaning, torn out by lightning; that incident inspired this work.

18.—Where is the safest place in the house during a thunderstorm?

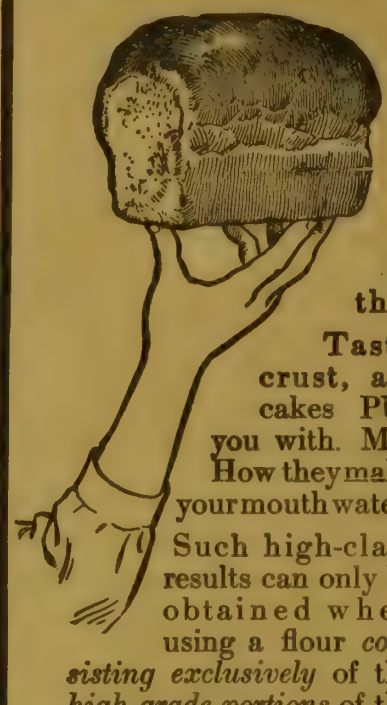
This may surprise you, but at night the safest place is sleeping in an iron or brass bed. To stand by the metal bed is very dangerous, for you are taller than the bed, but lying in it is safe, as the bed extends above and below you, and the current will not leave the bed to pass through you, but the walls above the bed and the floor beneath, would be ripped to pieces. Contrary to popular opinion, feather beds are not safe to sleep on, unless they are in a metal bed. If you are sleeping on steel springs in a wooden bed, the springs would save you if you are in the center of the bed, while the bed posts would be split to pieces, and possibly the bed would be set on fire. During the day the safest place is in the center of the room if away from the stove. Open doors and windows cut no figure as lightning does not come in at opeh doors as many people imagine.

19.—How should a house be rodded?

This is a very important matter and should be done only by a man who understands the system. But the essential things are good ground connections and sharp points. Ground connections should be made where water pipes come down, and be deep enough to be in permanent moisture. Do not bury them in charcoal or gravel or in cisterns as some pretended philosophers suggest, but in the pure, damp earth and at opposite parts of the house as much as possible. But this must be modified by the locations of the water pipe, as water pipes are rival conductors and would try to take part of the electric

Be Fair. Buy a sack or barrel before judging PURITY FLOUR

SOME people have attempted to judge PURITY FLOUR before knowing the facts about it—before using it. So we ask you to be fair and to buy a sack or barrel of PURITY FLOUR and give it a thorough try-out before attempting to arrive at a judgment.



Look at the beauty and loftiness of the golden-crusted, snowy-crumbed loaves, fit for a king. Count them and see how many more of them PURITY yields to the barrel than ordinary flour does.

Taste the creamy, flaky pie crust, and the deliciously light cakes PURITY FLOUR rewards you with. My! How they make your mouth water!

Such high-class results can only be obtained when using a flour *consisting exclusively* of the *high-grade portions* of the *best Western hard wheat berries*.

And remember, that, on account of its *extra* strength and *extra* quality, PURITY FLOUR requires *more* water when making bread and *more* shortening when making pastry, than you are accustomed to use with ordinary flour.

PURITY FLOUR

"More bread and better bread"

Buy a bag or barrel of PURITY FLOUR. Test it for a week. Then pass judgment.

Add PURITY FLOUR to the grocery list right now.

1115

discharge. For that reason the pipes and the rod should act in harmony, in which case the pipes assist the rod. Sharp points should be placed at the gable ends, and all should be connected together, and also to the tin valleys and water troughs and other metal parts. The rods should be nailed tightly to the building, and not put through glass insulators. Insulators are a damage to a rod as they cause it to be torn off, and have not one redeeming quality in them.

20.—What proportion of insurance losses are caused by lightning?

One hundred and eleven companies report that fully three-fourths of all their losses are caused by lightning. These losses are paid for buildings not rodded and for cattle near wire fences without ground wires. This information was collected by the president of the National Mutual Insurance Association in 1902 and read before the Iowa State Insurance Conventions in November, 1902, and published in the Mutual Insurance Journal at Lincoln, Neb., in December, 1902, and is destined to be the basis of one of the greatest reforms in insurance ever known.

21.—What proportion of lightning losses can be saved to insurance companies by a skillful system of rodding?

In 1905 fifty-three insurance companies of Iowa reported $34,386.48 losses on buildings not rodded, and only $1.00 loss on buildings that were rodded.

An Artificial Thunder Storm.

The people of the Maritime Provinces are being educated in the laws and nature of lightning and how to protect life and property, through the Dodd and Struthers Maritime representative, Mr. Armitage, 25 Peel St., St. John, N. B. with their wonderful artificial Thunderstorm. He

E. M. Armitage,
25 Peel Street, St. John. N. B.
Maritime Representative for Dodd & Struthers, Lightning Rod Manufacturers, Sherbrook, Que.

has given demonstrations at the Amherst Winter Fair and several other public gatherings throughout the Provinces.

The Dodd Thunderstorm is a most ingenious piece of electrical apparatus with which Mr. Armitage convinces the skeptical. It is Professor Dodd's invention, a thing which he worked out with infinite pains and by the expenditure of no small sum of money. Seeing is believing.

It is an impossibility for any man to witness Mr. Armitage's demonstration with this Thunderstorm Machine without being convinced of his power over lightning.

The actual conditions of a thunderstorm are reproduced on a small scale. You are made to see and understand how a building becomes "charged" with electricity, and why

KING COLE
TEA
Here is a real tea-treat that will surpass your fond recollection of 'the nicest cup of tea I ever tasted!' King Cole Tea will truly make an even nicer cup of tea an everyday reality. Such richness, such vigorous fullness of flavor, such pleasant smoothness were never concentrated so deliciously in your tea-cup before.
And the cup you enjoy a month hence will be as nice as your very first sip. Its delicious flavor never varies. You will love it more and more.
YOU'LL LIKE THE FLAVOR.

the lightning must "strike" under certain conditions.

You are bound to be convinced when you see the actual lightning flash.

And you are made to see how true lightning rods, properly erected, destroy the conditions which produce lightning and how impossible they make it for a building to become "charged" or that there should be a lightning "stroke."

The Dodd & Struthers Lightning Rod System, advertised on another page of this issue, has been highly recommended by the New Brunswick Board of Fire Underwriters and many other Fire Insurance Companies in Canada.

This Company is wiring several large buildings in the Maritime Provinces such as the Christ Church Cathedral of Fredericton, N. B., which was damaged by lightning in July 1911 to the extent of $70,000.

Each building, however, is a separate problem. Failure to rod right is total failure. You have absolute protection, or you have no protection at all.

Do you not believe it is the wisest plan to entrust this delicate matter to the firm which you know combines the right theory with the right practice and is known to erect the kind of rods that give protection in a way that absolutely protects?

Charlottetown Markets.

GRAIN—Oats, White 44 to 46c.; Black, 46 to 48c.

FEEDSTUFFS—Bran, Retail, $1.40 to $1.45; Shorts, $1.50; Middlings, $1.50; Oil Cakes, $2.50 to $2.75' Corn Meal, $1.85.

LIVE STOCK—Butcher's Cattle, 3¾ to 5c.; Stockers, $18 to $30.00; Milch Cows, $25 to $40.00; Sheep, 3¼ to 3¾c.

DRESSED MEATS—Beef (carcass), 6½ to 7½c.; Beef (retail), 8 to 14c.; Mutton (carcass), 7 to 8c.; Lamb (ex cold storage), 9½c.; Pork, 6½ to 7½c.

HORSES—Drafters, $125 to $225; Roadsters, $150 to $250; Carriage, $160 to $225.

DAIRY PRODUCTS—Creamery Butter, 25 to 28c.; Dairy Butter, 22 to 25c.; Cheese, 15 to 15½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 24 to 28c.; Fowl, 10 to 11c.; Chickens, 10 to 14c.; Ducks, 15 to 18c.; Geese, 14 to 16c.; Turkeys, 20 to 25c.

FRUIT—Apples, $1.75 to $4.00.

VEGETABLES—Turnips, 37 to 40c.

MISCELLANEOUS—Hay (pressed), $12.58 to $14.50; Hay (loose), 70 to to 75c.; Straw (loose), 30 to 35c. per cwt.; Wool, 25c.; Beef Hides, 10c.; Sheep Skins, 70 to 90c.; Lamb Skins, 70 to 90c.

Since last report market has remained firm and prices are about as before. There is no vegetables being offered at present consequently no price to quote. An odd small lot of potatoes comes and sells for local use at about 37 to 40cts. Dressed poultry is also scarce and very little of any thing offered except a few fowls. Oats and hay is also scarce and there is little or no oats stored in the city this winter. Pressed hay is also scarce farmers being inclined to hold for higher prices. Considerable loose hay has been offered lately at prices 73 to 78cts. Beef is plentiful but quality is poor and first class stock almost impossible to get and if obtainable would command higher prices than our quotations. Pork is plentiful considering time of year and demand is good. Select hogs selling at outside price 7⅞cts. and light and heavy according to quality down to 6½cts. Feeds of all kinds are scarce and hard to secure and stocks will be exhausted long before opening of summer navigation and prices therefore are likely to go higher. Trade in general has been quiet since the New Year as may be expected at this season of the year.

Every Farmer Keeps House

and he uses every sort of housekeeping convenience used by his city cousin. Moreover, he generally owns his house and so equips it permanently. He can and does buy better grades of merchandise for this very reason. When he buys a piece of furniture there is no thought of buying cheap "because it may not fit in the next flat."

When he buys a stove, he does not want one that will do for a year or two only "because the next house may have one installed," or have no room for a range of good size.

He wants a stove that will last him for years and which will not keep him sending to town everyfew months for repairs. He wants one that is modern and up-to-date—and yet a reliable range, not a faddy one. In short, he wants an—

ENTERPRISE MONARCH STEEL RANGE

because he has the makers' guarantee that it will do the work required of it and stand the wear and tear of daily use in a farm kitchen.

If you keep house you need a MONARCH in your business. Send for circular.

The Enterprise Foundry Co., - - Sackville, N. B.

Nova Scotia Fruit Growers' Convention.

(Continued from page 260).

iff, etc., and further said that apples sent to that market must be packed in boxes and be extra fine in quality and appearance.

The western market came in for a fair share of attention. Mr. Moore regretted that some lots shipped there were not properly packed. It will take many years to eliminate this impression. Our apples are not as well packed as in Ontario, and not as carefully graded. The barrel used here is not as attractive as the one used in Ontario, and many figures were quoted to substantiate this. Box packing is highly recommended, especially for gravensteins. They were too fine apples for barrels, as they could not be packed tight enough to stand a long journey. The barrel he considered the best package for the majority of apples, but for the finest apples he considered the box the best.

NOVA SCOTIA BARREL.

Mr. Innis, in the discussion which followed, protested that the barrel used in Nova Scotia was all right, and was established on a scientific basis. He proposed that the delegates to Ottawa report that the N. S. F. G. A. are satisfied with the present 96 quart barrel. The motion was carried.

Mr. P. U. Parker, of the D. A. R. office, Kentville, spoke briefly of a suggestion made by a C. P. R. official in Montreal recently. The Valley shippers should have a special brand, and it was proposed, "The Land of Evangeline Brand," and bearing the motto, "Grown for the taste." Each barrel to bear a guarantee or certificate of honest packing, and marked with a brand, so that the packer might be easily traced. If this guarantee was not fulfilled, the packer would lose his certificate and mark. This was made as a suggestion, and was to be independent of Government inspection.

FIGHTING THE PEST.

Mr. Payne, who has charge of the party in search of the brown-tail moth, spoke for a few moments, asking for co-operation in their work.

Prof. Cumming further emphasized the remarks made by Mr. Payne, and spoke of the difficulty in getting the co-operation of the people in the districts most infected. He cited the case of the New England States where the people were driven to work by the terrible depredations of the pest. "Face the situation squarely and recommend a policy whereby we can fight it," he said, "for it needs more than Government aid. The section west of Bridgetown is, perhaps, the worst in the Province, and here the people practically reluse to give aid, and offer ridicule instead." These were very plain statements, but Prof. Cumming said that if we were beaten out, the brown-tail moth would have possession of the Provinces.

CONSUMPTION OF APPLES.6

Mr. W. T. Macoun, Ottawa, gave a paper on the subject: "Is Apple-Growing being overdone?" He did not enter into figures largely, but gave his own ideas on the subject. Probably 50 years ago, growers began to talk on this subject, and it was still talked of, but not taken seriously. He caused some laughs as he pictured how the people of Canada could alone use 42,000,000 barrels per year. Better and quicker distribution of fruit was what was needed—and with this the growing could not be overdone.

One of the pioneers of co-operation in the Valley, Mr. J. N. Chute, gave a good address on "The Progress of co-operation." In 1907 the first co-operative society was formed, and now there are 21 in the County of Kings alone. He dealt with the uniform packing and grading of fruit, and so showed the value of the co-operative society as an educator in the business of apple packing. In connection with the co-operative society in Berwick, they ran an evaporator, which was a very paying proposition.

WANT DUTY INCREASED.

The discussion which next engaged the meeting was on the resolution "That the Dominion Government is requested to raise the duty on apples coming into Canada to equal that levied on Canadian apples going into the United States.

Mr. S. C. Parker moved that the delegates to Ottawa be instructed to oppose this resolution. Mr. W. W. Pineo spoke against the motion and the discussion grew general and most heated.

Mr. Robert Starr brought out the point that we were all Canadians that what we might do would seriously affect all the Dominion, and asked that the question be carefully considered before it was voted on. Mr. E. E. Archibald introduced the amendment to increase the duty in Canada to equal the duty in the United States. The amendment was carried.

OFFICERS FOR 1912-13.

President—S. C. Parker, Berwick.
Vice President—A. C. Starr, Port Williams.
County Vice Presidents:—
Annapolis—G. C. Miller, Middleton.
Kings—J. S. Bishop, Auburn.
Hants—Mrs. Wm. Sangster, Falmouth.
Halifax—G. C. McAloney, Halifax.
Lunenburg—W. A. Hebb, Bridgewater.
Digby—H. M. Rice, Bear River.
Yarmouth—S. A. Porter, Deerfield.
Shelburne—C. S. McGill, Shelburne.
Queens—Josiah Smith, Brookfield.
Colchester—Prof. Shaw, Truro.
Pictou—C. R. B. Bryan, Durham.
Cumberland—Sanford Purdy, Amherst.
Antigonish—F. R. Trotter, M.P.P., Antigonish.
Guysboro—Mrs. Alex. Anderson, Baddeck Falls.
Cape Breton—Dr. Kendall, Sydney.
Inverness—Rev. Fr. McPherson, Glen Dyre.
Richmond—Donald Urquhart, West Bay.
Secretary—M. K. Ells, Port Williams.
Treasurer—G. W. Munro, Wolfville.
Auditors—W. M. Black, J. Elliott Smith.

"It Took Me Fifty Years to Know How to Give You Better Roofs than any other Man"

"I tell you, every farmer in Canada should realize the big share a good roof has in making a good barn. That is my life-work—making roofs. I have been making my roof better and better for more than fifty years. What I have done for farm roofs is one of the biggest things ever done for people who farm."

"You ask me why a barn roof is so important. I will tell you. You build a barn and expect the roof to protect it many years. You put thousands of dollars' worth of produce under that roof while it lasts. Every pound of this produce costs you hard work. If a poor roof lets it get spoiled by wet, you lose money year after year. This lost money is many times the roof cost. Some roofs will last for several years. Some roofs will last if they are kept painted. But a roof is mighty hard to get at. It is not too safe to work on anyhow. Once a roof starts to leak, it is often left as it is. The result is the things you have in your barn spoil. This is lost money, and soon amounts to more than the cost of a good roof."

A Roof for Any Man

See What a Good Roof Can Do!

"I have spent my life making a low-cost roof that any man on his tinsmith could lay right. This roof of mine saves the stuff stored under it. It saves the barn framing and beams. It saves the foundation. This roof of mine doesn't need special roof timbering at all."

Good for 100 Years

"The big point about my roof is that it cannot develop leaks after you have had it up a year or two. It is a real roof from the first year it is on your barn to the last year. And do you know when that 'last year' will be? You will use that barn, and your son will use that barn, and your grandson will use that barn before that 'last year' comes. I want to pound the fact home to you that when you get a roof from me, you get a roof that is good for one hundred years. Think of getting a roof that makes your barn good for a hundred years. And that at about the price of an ordinary roof."

"That is why I say, 'I have helped the farmer more than any man ever did.' My roof will protect a good $100,000 of produce in your barn in 100 years. A roof that will do that is worth going after a good long ways."

Stands the Arctics

"This roof is so good that the Canadian Government Bernier Arctic Expedition used it for the Arctic regions. Here is immense cold and sweeping winds and ice and poor foundations to stand up under. The North-West Mounted Police use it. The Canadian Government has found no better roof for them. My roof is a good roof for the Arctic Circle. It is a still better roof for milder climates elsewhere."

Stands the Tropics

"But that is not all. My roof is used in the West Indies. Here is a temperature of 135 degrees at Porus, Jamaica. My roof stands it. In Jamaica during rainy season at Montego Bay, rain falls 10 inches in a single day. My roof stands it. In Ontario rain falls 30 inches in a whole year. My roof in Jamaica stands in 24 hours the rainfall it has easily 4 months for in Ontario. Is that a good roof? Is a roof that stands the severe conditions in both Arctics and Tropics good enough for you? You get exactly the same article, made on the same machines."

Used All Over the World

"Not only that, go down to South Africa. Go to the farms there. Go around Port Elizabeth, or Durban, or up in the Transvaal. You'll see my roof there. People will go around the world for my roof, because it is the best roof in the world. It will last 100 years. People use my roof in Japan—an earthquake country. They get it from me. They have searched the world for a roof that would stand earthquake straining. My roof will."

This Took 50 Years

"You are beginning to see something of the big work I have done. I have made a low-cost roof that stands terrific cold and heat, that stands tremendous rains, that stands ice, that stands earthquakes. In fifty years, I have made Pedlar roof better and better by little points added every year. It has world sales to-day, just because it is the best roof in the world at its very moderate price."

MY LATEST TRIUMPH

"Then, a few years ago, I put my finishing touch that made my roof wonderful. I had been troubled, not by my roof design, but by the metal in it. It seemed impossible to get a metal which would not rust. I had to take the best metal I could get. The design was all right. I had been making that design better for fifty years. At last I struck a clew in Europe."

"You know they have cathedrals there that are hundreds of years old. Yet the iron hinges on the doors are as good as ever to-day, though they were hammered out hundreds of years ago. I said to myself, 'Why not make up my roof in this peculiar kind of iron, so my roof will last like those door hinges?' Well, sir, that was a hard job. It was hard to get that iron duplicated. I worked for a long time and my chemists worked with me to get it. I stuck to it just as carefully as I had stuck to bettering my roof. And I got it at last. That's the metal I use to-day."

You Get the Benefit

"My roof is the only roof in the world with this kind of non-rusting iron in it. I am the only man a farmer can come to and say, 'I want a hundred-year roof at about the price I would pay for cedar shingle.' I am the only man that can deliver that kind of goods.

"My roof will not rust to the leaking point within 100 years. It saves the barn and its product from the weather. It saves the barn from thaw-water and lodged ice, because the seams cannot be gouged apart. It saves the barn from fire, because sparks cannot burn it. A burning stick on the roof will not harm it, or harm the barn under it. Lightning cannot burn a barn with my roof on it. My roof is a perfect conductor of electricity. My roof has 'give' in it to defy heat and frost, and protects in winter and summer. It protects even though the rafters sag. Wind cannot blow my roof off a barn. This is because it is a ventilated roof. It keeps your barn ventilated and stands the heaviest winds safely."

Get My Barn Book

"I want to send you my book 'ROOFING RIGHT.' This lets you dig into more facts about the Pedlar roof. You will see how clean it is. It gives the best cistern water you can gather, as it is self-cleaning. This book shows scores of good barn designs—the best barns in Canada. Every one has my roof on it. You will get big help from my book, and I will send it free for a post-card, because you can plan your barn [illegible] whether you use my 100-year roof or not."

"I am the best friend the farmer has, because I have given him one of the best roofs in the world at a very low cost. I want to send out more of my barn books, because I want to see good barns built. I send a book free to you, if you will ask for it. Write me to-day."

Executive Board—The President, Vice President, Secretary, Wm. O'Brien, Windsor Forks, Hants Co., R. J. Messenger, Bridgetown; C. O. Allen, Kentville; S. B. Chute, Berwick.

Publication Committee—The President, Secretaty, A. C. Starr, Port Williams.

Delegates to Farmers' Association—E. H. Johnson, Wolfville; R. J. Messenger, Bridgetown. @ ...

Delegates to the Ottawa Fruit Conference—R. J. Messenger, Bridgetown; John Chute, Berwick; F. A. Chipman, Round Hill; A. C. Starr, Port Williams.

At the closing session, the newly elected president, Mr. S. C. Parker, gave a brief review of the work of the Association during the twenty years he had been identified with it and promised a review of the Association's work since its inception at the next meeting.

RESOLUTIONS.

"Whereas, the system of inspecting apples in the Province of Nova Scotia which has been the practice the past few years, mainly at the port of shipment is not entirely satisfactory, inasmuch as it is only possible to inspect a very small percentage of the apples at the ship and then many shipments made through other channels, where they escape inspection;

"And whereas under the present Fruit Marks Act, the Inspectors are not authorized to inspect open package.

"Therefore, resolved, that the Nova Scotia Fruit Growers' Association now in session respectfully request that the Dominion Government to have made such changes in the 'Fruit Marks Act' as well as provide for a more thorough system of inspection at the packing houses, ports of shipment and elsewhere including open packages, when or where advisable and also to issue certificate of inspection when circumstances and conditions warrant doing so."

This resolution was moved by Col. S. Spurr, seconded by Miles Chipman.

Different speakers on this important issue were: R. S. Eaton, C. O. Allen, M. K. Ells, A. H. Starr, R. E. Harris, A. S. Banks and J. N. Chute.

In the course of his remarks Capt. C. O. Allen gave some interesting information. He said that at the evening meeting Tuesday, there was a decided feeling that the complaints concerning apples that went West were all directed against Co-operative Companies. In talking with Mr. Moore, Capt. Allen learned that this was not so. Not one of the twenty-five recommendations for fines, etc., were directed against co-operative companies, but in every case against private individuals. This explanation caused a feeling of satisfaction, as a large number of men prominent in Co-operative movements were present and resented the imputation put on this good name. Resolution carried unanimously.

The second resolution was: "Whereas, the Dominion Act regulating the size of apple barrels is not being complied with in the fruit districts of the Province,

And, whereas, it is important that all barrels containing apples should be fully up to the standard required by the Act.

"Therefore, be it resolved that the department to which it may belong be requested to add to the duties of the Apple Inspector, the inspection of the barrel as well in which the apples are packed,

"And also that the Act be so amended as will require all coopers who manufacture barrels in which apples are packed and offered for sale to brand their name and address on the side of each barrel made by them, and also making such manufacture of barrels subject to a fine of twenty-five cents for each barrel so made by them not complying with the Act."

The third resolution affected the College of Agriculture, and asked that the Government build a suitable dormitory for the students in attenddance.

Another resolution referred to the District Horticultural Exhibition. It is claimed that the influence is not as wide as a more extensive exhibition held in Halifax and it was asked that the Fruit Growers' Association express itself in favor of a larger and more comprehensive exhibition to be held in the capital city similar to Horticultural Exhibitions held in Vancouver, Toronto, etc.

A resolution regarding the growing of tobacco for experimental purposes on the Government Farm was introduced at the instance of the W. C. T. U., and some lively discussions ensued. A large number of members expressed their views that such an action would be detrimental to the youth of Nova Scotia, and the resolution carried.

The definition of No. 3 apples was discussed, and it seemed to be the general opinion of the Association that the shipping of No. 3 was detrimental to the apple trade. The definite size for grading apples was thoroughly discussed and a motion requesting the Government to define the size of the different apples, No. 1 and No. 2.

Votes of thanks were tendered to the Mayor of the Town and the people of Wolfville also to Mr. Black for the use of the opera house, and to the C. P. R. for their very courteous treatment to all delegates. The meeting then closed and the Association regard it as one of the most important in its history.

LOCAL TREATMENT FOR WOMEN'S DISORDERS

The health we enjoy depends very largely upon how the blood circulates in our bodies; in other words, if we have perfect circulation we will have perfect health.

There is a constant wearing out of the tissues in every part of the body. The blood flowing through the veins carries off this waste or dead matter, while the blood coming from the heart through the arteries brings the fresh new living tissue, the essence of the food we have digested, to replace what has been carried off. This constant wearing out and expelling of the dead matter and the replacing of it with new matter, atom by atom, goes on day and night, until in about 7 years a complete change has been effected. Thus every man and woman has an entirely different body in every particle of it from what he or she had 7 years before.

It sometimes happens, however, from a variety of causes, that the blood becomes congested in certain portions of the body. This means that the blood vessels in these parts become weakened, and the circulation in that section of the body becomes sluggish and stagnant. The consequence is that the dead matter in that part of the body is only partially carried away, and that but little of the new, vital matter is introduced there to build up and strengthen the tissues and nerves.

This condition invariably exists in all cases of female disorders. The dead matter retained in the circulation, which should have been expelled, causes irritation and inflammation of the delicate memberane, and oppresses the nerve centres. This condition is the cause of the grievous physical and mental suffering which accompanies female troubles.

To obtain relief it is evident that the first thing to be done is to get rid of the dead matter which is being held in the circulation. If this dead matter is allowed to remain there a species of blood poisoning will result and nature will endeavor to get rid of it by forming ulcers, tumors, etc.

The above explanation will also show why **ORANGE LILY** is so successful in curing this condition. It is a local treatment, and is applied direct to the affected organs. Its curative elements are absorbed into the congested tissue, and from the very start the dead matter begins to be discharged. A feeling of immense relief, both mental and physical, accompanies it, and the improvement is constant and positive. This feature of the expelling of the dead matter is always present to a greater or less extent, and in some cases it is so marked as to be amazing. The case described in the following letter is not exceptional:

Dr. Cooney—I am thankful to Mrs. F. E. Currah, your Canadian representative, for my health restored by your wonderful remedy. I have suffered for 17 years, but not so bad until 3 years ago. Then I had a doctor, who told me I had a tumor, and could live no more than a year. If I went through an operation I would not live through it. A year later I sent for him again, and he gave me up to die. My husband then sent for another doctor, who performed an operation, and it did me much good. I doctored with him 3 or 4 months, but became so bad again that I thought I could live no longer, and I began to long to die. One day my husband came home and threw a slip of paper to me with Mrs. Currah's address and told me a lady had advised him to write to her for a treatment that would cure me. I said it was too late, that I would die anyway. I could not lift a teacup without hurting me. Then the first doctor told me I was worse than ever. However, my husband sent for **ORANGE LILY**, and the third treatment brought away one tumor. Others followed, until 7 tumors had been expelled, 3 large ones and 4 small ones. I know if it had not been for **ORANGE LILY** I would have died, for I could not live much longer. I would have thought it cheap at one hundred dollars for a month's treatment, instead of one dollar. It is worth its weight in gold.—MRS. GEO. LEWIS, Huntsville, Ont.

The above letter is published with Mrs. Lewis' permission. All letters received are treated as being sacredly confidential, but occasionally some patient feels so grateful for being cured that she is willing to make the matter known for the benefit and encouragement of her suffering sisters.

ORANGE LILY is a positive, scientific remedy for all disorders of the female functions. As explained above these troubles are of local origin, and require local treatment. It is just as sensible to take medicine internally for female troubles as it would be to take medicine internally for a bruise, a boil or an ulcerated tooth. In all these cases some dead matter is being retained, and the cure is effected by employing local methods for expelling the dead matter. **ORANGE LILY** has antiseptic, soothing and healing properties, and also tones up and invigorates blood vessels and nerves. I am so anxious that every suffering woman may satisfy herself, without cost to her, that **ORANGE LILY** will cure her, that I hereby make the following

FREE TRIAL OFFER

I will send, without charge, to every reader of this notice who suffers in any way from any of the troubles peculiar to women, if she will send me her address, enough of the **ORANGE LILY** treatment to last her ten days. In many cases this trial treatment is all that is necessary to effect a complete cure, and in every instance it will give very noticeable relief. If you are a sufferer, you owe it to yourself, to your family and to your friends to take advantage of this offer and get cured in the privacy of your home, without doctors' bills or expense of any kind. Address MRS. FRANCES E. CURRAH, Windsor, Ont.

SUNNY SIDE STOCK FARM.

The Ayrshire herd now headed by "Greenslack Great Fortune" (imported), his dam had a record of 12840 lbs. of milk 3.9 fat in 45 weeks. At present I am offering for sale in Ayrshires, one bull 18 months, one 12 months, two 5 months and two young calves. Females any age. In Guerneseys, one bull 12 months, one young heifer calf. In Chester White Swine, young sows 3 months old and am booking orders for March litters from two aged brood sows. Inspection invited. Intending purchasers met at I. C. R. Station.

Riverside Holsteins For Sale

Either sex, all ages, out of heavy producing show cows, also high grades, well grown and in good fit; sired by some of the best bulls in Canada. LEA & CLARK, Victoria, P. E. I

The Seed Commissoner's Report.

We have recently received a copy of the report of the Seed Commissioner from January, 1905, to March, 1911. The work of this Branch is such that the results scarcely warrant the publication of an annual report, supplementary to the report of the Minister of Agriculture. In lieu of such report, it has been the practice of the Seed Branch to issue bulletins dealing with particular phases of the work.

The purpose of this report is partly to provide a record of the work done and partly to explain the meaning and the application of the new Seed Control Act. The Commissioner has endeavored to illustrate the relative qualities of the different grades of timothy, alsike, red clover and alfalfa seed and to describe noxious weeds and other useless or harmful plants.

We would strongly advise each and every one of our farmer readers to procure a copy. The Seed Commissioner, Department of Agriculture, Ottawa, will gladly forward you one without money and without price. Send for it to-day. It will be a valuable addition to your library.

The Sheep Industry Commissioner's Report.

We have received a copy of the Report of the Commissioners upon the Sheep Industry in Canada, Great Britain and United States. Our readers will remember that, in July 1910, Messrs. Dryden and Ritch were appointed, as a special Commission, to investigate the conditions affecting sheep raising in this and other countries. It is believed that the Report in which the Commissioners have embodied the results of their investigations is by far the most exhaustive treatise which has yet appeared in Canada, relative to the raising of sheep and the production of wool. In view of the indifferent attitude, with respect to the keeping of sheep, manifested by too many Canadian farmers, this Report appears at a very opportune time. The Commissioners, at the end of the Report, have made a number of recommendations the adoption of which would, in their opinion, lead to the encouragement and development of the whole industry.

We are pleased to announce that the Report is now available for distribution and that a copy may be obtained, by any interested party, upon addressing the Live Stock Commissioner, Department of Agriculture, Ottawa.

The Horse a Man's Companion.

No foot, no horse, is as true today as when the old aphorism first fell from the lips of man. Domestication of the ancient "companion of the wind," has caused him to be put to many uses, and the constant reproduction of hereditary defects has changed him into a very short lived piece of machinery, which is often out of repair.

A horse as a domestic animal is, of all the animal tribe the largest sharer with his master in his liability to accidents and dangers which are among the incidents of civilized life. While travelling he may pick up a nail from the road, or slip upon an icy street. No matter where this faithful animal is there is no hour when he is not in danger of incurring injuries which may demand the best skill to repair.

This is a good time to organize an agricultural club in your neighborhood.

The cow that is allowed to fall off in her milk flow is seldom made to regain it at a profit.

IT MAKES LIVE MEN OUT OF WRECKS

Many people would give all they possess to regain the health they have lost. Many have spent their last cent in its pursuit—and thrown their money away.

Such people are misled by custom and the well-meant advice of friends. They take every new drug under the sun and find them useless.

Yet here is a simple, natural remedy, Dr. McLaughlin's Electric Belt, that does what other things fail to do. It does not poison the system nor depress the spirits. On the contrary, it starts the life current anew and produces health. It invigorates the mind. Without knowing how, the patient jumps from despondency to health and ambition.

There is nothing wonderful in this change. It is all so natural. Think what the effect would be if you were suddenly deprived of all the electricity in your body. You could not live an instant. No mental or physical life could exist without Electricity. Naturally, when the amount is below normal, you are less vigorous, less ambitious.

Then is the time my Belt does great things for you. It recharges your nerves with life-giving currents. Soon strength and vitality are restored. You feel the old, stimulating glow of health. You now have the right amount of Electricity, and you feel "equal to anything."

What is my Belt? It is a body battery, made for the purpose of applying Electricity to the human system in the most scientific and effective way. It is made on an entirely different plan from the worthless devices known by "Electric Belt." Its current is of guaranteed strength and constancy. It is provided with a regulator. This enables you to change the current to suit varying needs. You wear it at night. Its soothing currents send you to sleep. You wake up refreshed and invigorated. Before long you feel like a different person—and you are different. Your friends tell you so.

The benefits of my Belt are being daily demonstrated by thousands of patients, and it is heartily endorsed by those who have been cured.

If you are sick or weak, and your doctor isn't helping you much, you ought to try my Belt. It's a grand remedy. All such troubles as Indigestion, Constipation, Torpid Liver, Tired Feeling, Weak Kidneys, Rheumatism, Neuralgia, Lame Back, Lumbago, Sciatica, Sleeplessness, Nervousness and Headaches are cured completely with Electricity applied with my Belt; it overcomes all signs of weakness or breakdown in men and women. My Belt not only cures the sick, but gives the well a greater zest in life.

If you haven't confidence in Electricity, let me treat you at my risk. I will give you the Belt on trial, without one cent of risk to yourself. Give me reasonable security, and I will take your case, and

WHEN YOU ARE CURED PAY ME

Hurt Back — Caused Partial Paralysis.

Box 497, Nelson, B.C.

Dear Sir, — I have much pleasure in telling you that I am much improved by using your Electric Belt. As you know, I got my back hurt, and it produced partial paralysis of the lower extremities. I have now used your Belt continuously every night for three months and have almost regained my usual strength. I can now lift one hundred pounds, whereas three months ago I could not lift twenty. You are at liberty to use this letter in any manner you wish. I am, sir,

Yours faithfully, Charles Smith.

Now Able to Win Races.

Little Current, Ont.

Dear Sir, — Your Belt has given me great satisfaction. I won a Marathon race to-day and never felt any trouble of being tired nor any more pains in the back. I never was known to be a good runner before. I thank you very much for your Belt as it is well worth a hundred dollars. I will advertise it whenever I can to let people know how good your treatment is.

Yours sincerely, Mike Lewis.

Cure of Chronic Constipation and Dyspepsia.

North Nation Mills, Que.

Dear Sir, — I write to let you know that I am highly pleased with the work your Belt has done for me. It has done what no medicine would do. For years I have had to take medicine every night for constipation, and now your Belt has completely cured that trouble, also dyspepsia. I cannot thank you too highly for what you have done for me. I am recommending your Belt to all troubled with similar ailments, and no doubt you will hear from some of them soon.

Yours truly, J. Allan.

Kidney Trouble and Weak Back.

Morrisdale, King's Co., N.B.

Dear Sir, — Just a few lines to let you know that I am a well man now, where before I was a sick one, thanks to your Belt. I think it is the best in America or in the world. You may publish this letter anywhere you want to, and I will be pleased to tell anyone of your Belt who may come or write to me. I remain,

Yours truly, Jas. A. Ross.

FREE BOOK.

If you cannot call and see me personally, you can write for my book. It will cost you nothing, and will tell you lots of things you ought to know. Send coupon for this beautifully illustrated 84-page Free Book to-day "Electricity is Life." I know best how to apply the remedy, and thousands of men owe their health and happiness to-day — their success in life — to DR. McLAUGHLIN'S ELECTRIC BELT.

A Windsor Lady's Appeal.

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 309, Windsor, Ont.

Here is a remedy that will cure your cold. Why waste time and money experimenting when you can get a preparation that has won a world-wide reputation by its cures of this disease and can always be depended upon? It is known everywhere as Chamberlain's Cough Remedy, and is a medicine of real merit. For sale by all Dealers.

Judging Cows.

Judges and experts have realized the importance of ceratin points and have fixed a set scale for judging dairy cows.

Since the flow of milk depends primarily upon the number, activity and efficiency of the milk glands; and secondly, upon the flow of blood to the udder and the nutrients contained in the blood, it is clear that the stomach and udder deserve the importance attached to them; and since the nervous system is closely co-ordinate to the digestive system and directly controls to a considerable degree, the flow of blood to the udder, it also deserves attention.

Since the abdomen and udder are the chief manufacturing points, it is but natural that extreme development in these parts should be sought for, and inasmuch as meat carrying capacity and inclinations are not considered essential in highly specialized dairy cows these have been neglected. This has resulted in a general type, that has been found to be good in milk production.

There is no reason why a dairy cow must be narrow in front or wedge-shaped, but because of the extreme development of certain portions of the body and neglect of the other portions, such a wedge-shaped type has resulted, and is considered desirable by dairymen.

The refinement about the head and neck and the lightness of the fore-quarters indicates that the animal is not disposed to lay on flesh, but rather devotes her food to milk making.

A strong constitution is necessary, and this is secured in the dairy cow by a deep chest with good width, particularly on the floor of the chest rather than by great spring of rib. Thus, in the beef animal the strength of constitution is secured by a deeper chest, egg-shaped with end down.

As the supply of nutrients furnished through the blood to the mamary glands is governed by the efficiency of the digestive organs, a large barrel is very desirable, and is insured by long, well sprung ribs, set wide apart. The open jointedness of the black is merely an indication of the general openess of the skelton which, as it gives a large roomy body, large for weight, is considered desirable.

The broad loin accompanied by width of hind quarters and roomy barrel. The young animal is nourished before birth, by blood vessels passing through the navel, and if large, it is considered to indicate that the foetus was well nourished before birth and as an animal born strong and vigorous invariably makes a better animal than one born weak, there is some reason back of the demand for a large navel.

The width of hips, length and width of rump, and width between the pin bones are all indicative of a large roomy pelvic region, well adapted to sustain the udder and to the demands upon the female in giving birth to young.

Viewing the cow from behind and on the inside of the thighs, it will be noted that the hair is inclined to grow in an opposite direction from that on other parts of thebody. The portion so noted is known as the escutcheon, and its importance is due to the fact that it is to some extent indicative of flow of blood to the udder. It is believed that a well developed escutcheon is only found in connection with large arteries.

Knowing the structure of the milk secretion it is clear that a long udder containing a great number of glandular structures which make up milk glands, is favorable to a large secretion of milk; and this length of udder is secured by an high attachment behind and by an extension well forward on belly of the udder.

Inasmuch as there should be in the udder only glandular structures, connection tissue, blood vessels, nerves

Don't Dally with a Cold!

It's a dangerous visitor—show it the door. The quicker you get rid of it, the less likely it will be to return.

NA-DRU-CO Syrup of Linseed, Licorice and Chlorodyne

offers probably the quickest, most effective means of doing this. It promptly relieves that stuffed-up feeling, soothes the irritation that causes the cough, loosens the phlegm, promotes expectoration, and drives out the cold completely.

It contains nothing injurious—in fact, we'll gladly give your physician or druggist, on request, a full list of its ingredients.

Burdock Blood Bitters

CURES ALL

SKIN DISEASES

Any one troubled with any itching, burning, irritating skin disease can place full reliance on Burdock Blood Bitters to effect a cure, no matter what other remedies have failed.

It always builds up the health and strength on the foundation of pure, rich blood, and in consequence the cures it makes are of a permanent and lasting nature.

Mrs. Richard Coutine, White Head, Que., writes:—"I have been bothered with salt rheum on my hands for two years, and it itched so I did not know what to do. I tried three doctors and even went to Montreal to the hospital without getting any relief. I was advised to try Burdock Blood Bitters, so I got three bottles, and before I had the second used I found a big change; now to-day I am cured."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

LUMBERSOLE BOOTS

Our Lumbersole Boots are made of fine Grain Kip uppers, lined with thick brown felt about 1-4 inch thick, as the name suggests the soles are made of specially selected wood which resists the water, and keeps feet warm.

For Farmers, Drivers, Fishermen, Builders, Sailors and all outdoor workmen they are worth four times the price.

Send for Catalogue of bargains in Shoes and Clothing and Free Premium Lists.

When you want a reliable medicine for a cough or cold take Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all Dealers.

and such fibrous tissue as is necessary to sustain the udder, no fleshiness should be apparent; if present, it indicates the presence of an unnecessary amount of tissue and which can be of no use, which may interfere with the working of the milk-secreting glands.

The teats merely, serve to draw the milk from the udder, and the only necessary requirements are that they shall permit of the passage of a good stream of milk, and shall be of a size easily grasped by the hand. The milk veins discharge most of the blood which passes through the udder, and hence, are useful in determining the blood flow.

Large, long, tortuous milk veins, branching and entering the body by large milk wells almost invariably characterize heavy milkers.—G. L. McKay.

Canadian Pulpwood in the United States

In a Pulpwood Forest Products Bulletin shortly to be published by the Dominion Forestry Branch, statistics are given of the amount of pulpwood exported from Canada into the United States during 1910. Nine hundred and forty-three thousand cords of pulpwood (sixty percent of the total Canadian pulp-log cut) worth six million, two hundred and ten thousand dollars, were shipped across the border in a raw state, without undergoing any form of manufacture. This pulpwood export was cut from the various provinces in the following amounts and values: 779,000 cords worth $5,090,000 from the timber limits of Quebec; 90,000 cords worth $647,000 from New Brunswick and 74,000 cords worth $473,000 from Ontario. It is interesting to note to what extent provincial industry would have been increased if the pulpwood exported to the United States had been converted into woodpulp on Canadian soil. The seven hundred and seventy-nine thousand cords exported from Quebec would have supplied material for a year to fifty-six pulpmills of the average size operating in Quebec. In Ontario, five mills of the average size could have been kept running with the pulp logs exported from this province. The ninety thousand cords shipped from the ports of New Brunswick would have produced the most startling results if the amount had been domestically manufactured into pulp. The amount exported was sufficient to supply with wood twenty-four mills of the average size, with the result that five times the number of mills operating, would have been at work if Canadians in New Brunswick had been farseeing enough to manufacture their own raw products.

When Fire Breaks Out.

Before the flames that consumed a $2500 farmhouse had finished their costly work, a neighbor said to me, "I have one good fire extinguisher now and I'm going to get some more right away." And he will. A few disastrous fires in the same community show how inadequate is the fire protection and means of fighting a fire on the average farm. On every farm some preparation against a like calamity should be made.

I was at this fire in less than 15 minutes from time it was discovered, and I know that the building could have been saved had there been a good ladder and some pails to carry water to the blaze, but there were none to be had. As for ourselves, we have a supply of ladders always on hand, being interested along fruit growing lines, but the average farmer falls short when in need of a good, strong, long ladder. When it comes to fire protection, our city brethren have an advantage over us. Yet all of us could be better prepared for this unannounced visitor with mighty little expense to us.

Whatever ladder we may have should have its nook for holding it in place and in the dry. We have a shed midway between house and barns, where we keep a 12-foot and a 16-foot ladder, and it is well worth while to have them in the dry, as well as knowing where they are when wanted.

Still another thing. More than one-half of our farms have a supply water tank, located high enough to force a stream of water over the average building, but so few have any means of getting that water where wanted, as could be done by a hose; and that hose ought, by right, to be 30, 40 or 50 feet long. And say! could you put your hand on a pail if you wanted one for any reason whatever?

We also all know the value of fire chemicals, fire extinguishers, etc., and possibly one-fifth of the farmhouses are thus equipped. However, the loss in money is not all that a fire means; far too often the deeds or the farm home abstracts, receipts, certificates and so on are destroyed and these in a great many cases cannot be replaced. Two mighty safe and easy ways to protect such documents, of course, are available: one the safety deposit vault in the local bank, and the other a small, but fireproof safe of sufficient size to hold such papers of immeasurable value. To the farmer and his children, the vault can usually be rented for $5 or less a year, and a safe may be purchased at from $15 to $25 that will last almost forever. These may seem extravagant, but fires come unannounced usually, and every farmer that has lost such articles would gladly give three or four times the cost of a safe for the original documents.—R. E. Rogers in N. E. Homestead.

SPREADING THE GOOD NEWS

Prominent Ontario Man Recommends Gin Pills For The Kidneys

Found at last—a genuine cure for Kidney and Bladder Troubles. Mr. Bauer knows about it. Mr. Simpson knows about it. And they are telling all their friends and neighbors what Gin Pills did for them. Here is Mr. Bauer's letter. Study it.

DAVISVILLE, ONT.

"I had trouble with my Kidneys and Bladder so I got a sample of GIN PILLS and followed directions. I felt better after the first dose and I kept taking them for a month.

One day, Mr. Simpson of this town told me about the trouble he had with his kidneys, and I recommended him to try GIN PILLS, and gave him one to take. The next day, he bought some for himself, and both he and his wife have derived great benefit from them."

HERBERT H. BAUER.

Every man who has any Kidney Trouble or suffers with Rheumatism should do just as MR. BAUER did—take GIN PILLS—and cure himself, as MR. BAUER did.

You see, GIN PILLS do cure Kidney and Bladder Troubles. Gin Pills ease the pain in the back and stop those sharp, shooting pains. Gin Pills give strength to weak kidneys, soothe the irritated bladder and correct incontinence and suppression of urine. You don't have to take our word for all this, or even buy Gin Pills before trying them. Write for free sample—try them—see how good they are—and then buy the regular size boxes at your dealer's—50c, or six boxes for $2.50. Write for the free sample. National Drug and Chemical Co. of Canada Limited, Dept. M F Toronto.

A SPEEDY CURE

Kentville, N. S., January 1st, 1910.

Messrs. C. Gates, Son & Co.,

Gentlemen,—This is to inform you that I have been a sufferer for the last fourteen years from kidney and stomach trouble, brought on by severe colds. Having been laid up every winter during that time. Last year I was laid up for seven months, so that I could not go out of the house. Dropsy set in, and my stomach swelled so that I was six inches larger than my usual size, had two doctors in attendance, but I grew worse and they were going to tap me—my friends despaired of my life. At this time I was recommended to use

Gates' Life of Man Bitters and Invigorating Syrup No. 1.

and in one week after commencing their use, my size was reduced two inches, and in four weeks was reduced to my usual size, so that I went to work in my mills, and have been able to continue it ever since. By continuing the use of your BITTERS and SYRUP, I hope to get a cure of the kidney and stomach trouble so far as it is possible, as it always helps me when I take it. You may make these truths known for the benefit of sufferers.

Yours very gratefully,
John W. Margeson.

Factors Affecting the Percentage of Fat in Cream.

One of the constant sources of friction between creameries and their patrons is the variations in the richness of cream. In order to arrive at a better knowledge of the factors affecting the percentage of fat in cream, experiments were conducted by O. F. Hunziker, of the Indiana station, and C. H. Eckles and H. S. Wayman, of the Missouri station.

In testing the effect of speed with five different makes of hand separators on richness of cream, the Missouri station found that with one exception, set for thin cream, the greater the speed of the machine the higher the percentage of fat in the cream, and this effect was much more marked when the cream screw was set for thick cream. Within ordinary limits the greater the speed the less the amount of fat remaining in the skim milk. This did not vary to any marked extent whether the separator was set for thin or thick cream. The rate of inflow was uniformly increased by the speed. The explanation given for this is not that the greater the speed of the separator the more milk will run through it in a given time, but that it is due to suction caused by the flow of air through the machine. The capacity of the separators did not vary to any extent whether set for thick or thin cream. By varying the speed of the separator the Indiana station found the cream to vary in fat content from 10 to 65.5 per cent. The work of both stations proved that, contrary to the general assumption, the higher the temperature of the milk separated the thinner the cream. This was found to be more marked when the separator was set for thick cream than for thin cream. The colder the milk separated the greater the loss of fat in the skim milk. That the percentage of fat in cream varies practically in direct proportion with the percentage of fat in the milk separated, or, in other words, that the ratio of cream to skim milk is not changed by the variation in the richness of the milk separated, was demonstrated by both stations. Prof. Hunziker found that by varying the rate of inflow the percentage of fat in cream varied from 23.5 to 70, the greater the rate of inflow the thinner the cream. This was substantiated by Profs. Eckles and Wayman, who found that even the height of milk in the feed can affected the fat content of the cream to some extent. Acidity had but little effect according to the Missouri station, except that with sour milk there is a tendency for the percentage of fat in the cream to be increased, especially when the cream screw is set for thick cream. A small obstruction in the skim-milk tube, due to dirt or some other foreign substance, does not as a rule make any marked change in the operation of the machine. If the cream opening is partly closed, however, the cream becomes smaller in quantity and richer. The accumulation of separator slime sometimes results in a larger quantity and thinner cream due to a partial obstruction of the skim-milk tube. To show definitely the effect of the amount of water used to flush the bowl on the richness of cream, Prof. Hunziker conducted experiments with the following results. When no water was used the average percentage of fat in the cream was 37.8; with water equal in amount to the capacity of the bowl, 37.3; with sufficient water to cause the cream discharged to appear watery, 35; and when twice the amount of water needed was used the percentage of fat in the cream was 33.5.

These experiments prove conclusively that, even though there is a wide variation from day to day in the cream tests, it does not necessarily follow that the creamery is dealing dishonestly with its patrons. They also show the necessity for uniformity in the care of milk on the farm, especially as regards separation, and in the sampling and testing of cream at the creameries.

If cream is tested correctly and if the tests of different lots of cream from the same patron vary, then these variations must be due to variations in the richness of the cream. It is impossible to procure cream of exactly the same richness from different skimmings from the gravity can. The richness of cream from a farm separator is primarily determined and regulated by the cream screw. The richer the milk the richer the cream if all conditions remain the same, for the ratio of skim milk to cream remains constant. During early summer months the milk is usually comparatively low in fat. Advance in lactation period and change from succulent to dry feed cause milk to become richer in fat. The first drawn milk is much poorer in fat than the strippings. The greater the amount of milk running into a separator of a definite capacity per hour the thinner will be the cream. The greater the speed of the separator the richer the cream. If the speed is too low a large amount of the fat is lost in the skim milk. Warm milk produces more and thinner cream than cold milk. The proper temperature to separate milk on the farm is from 90 to 95 degrees F. and immediately after it is drawn. The more water or skim milk used to flush the bowl of the separator the thinner will be the cream. The most satisfactory cream for the creamery is that which tests about 35 to 40 per cent fat.

If the tests are to be uniform and accurate, the cream must be in such condition, when sampled that a fair and representative sample can be taken. If, at the time of sampling, the cream is too thick, is tough, dry and leathery on the surface, is partly churned or curdy, it is very difficult to secure a fair sample, and tests of such cream are likely to be irregular as well as inaccurate.

In order that the cream may be in proper condition for sampling and testing upon delivery to creamery, the farm separator should be thoroughly cleaned and scalded after each separation; after separation, the cream should be immediately cooled and kept cool by setting in cold water; the cream should be stirred occasionally; the cream should be delivered in clean cans not less than twice per week in winter and three times per week in summer; in transit the cans should be covered with a dry blanket or jacket in winter, and with a wet blanket or jacket in summer; cans should be reasonably full of cream in transit to prevent churning.

"Bissell" rollers are a specialty

The "Bissell" Rollers are built by men who have made a life study of this work, and are SPECIALISTS IN THE BUSINESS. Search as you may, there are no such perfect Land Rollers on the Continent as the "Bissell." Make a note of these points and compare the "Bissell" Rollers with any other Land Roller in America. If the "Bissell" does not convince you that it is the best Roller, then don't buy, but you ought to know the facts, and it will do any person good to make the comparison. No need to send special travellers to sell "Bissell" Rollers. Practical farmers see the difference and prefer the "Bissell."

The 18 cold rolled anti-friction Bearings ½ inch thick with lathe cut ends, held in the one piece Malleable Iron Cage, is a single point placing the "Bissell" Roller away ahead.

Look for the name "Bissell" on every Roller. No other is genuine. Ask Dept. M for free catalogue. 51

IF THE LIVER IS LAZY

STIR IT UP BY THE USE OF

MILBURN'S LAXA-LIVER PILLS.

They stimulate the sluggish liver, clean the coated tongue, sweeten the breath, clean away all waste and poisonous matter from the system, and prevent as well as cure all sickness arising from a disordered condition of the stomach, liver and bowels.

Mrs. Matthew Sullivan, Pine Ridge, N.B., writes:—"I had been troubled with liver complaint for a long time. I tried most everything I could think of, but none of them seemed to do me any good, but when I at last tried Milburn's Laxa-Liver Pills I soon began to get well again; thanks to The T. Milburn Co. I would not be without them if they cost twice as much."

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, for sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

TO HUNTERS AND TRAPPERS

Having large orders to fill and considering the advance in market prices, we are now paying from 20 per cent. to 25 per cent. above the quotations given in our November Price List for Raccoon, Skunk and Rats. Ship your furs to us and get the full benefit of the advance.

Lubricating Domestic Machines and Tools.

A wise and busy housewife will realise the importance of keeping a lubricant in a handy place, so that all kinds of household machinery, vehicles, and garden tools, shears and scissors that need oiling may be attended to at least once a month. It saves time and temper if a machine or implement works easily. Little oil is required for the bearings of small machines, such as wringers, washers, sewing-machines, perambulators, if the oil holes are kept free from stale oil and dust. It spells trouble in the laundry should this sticky mess get on linen or clothes of any kind—the stains are not easily got rid of. Door-hinges, locks, knobs, latches, window fastenings, roller-blind brackets, and a multitude of other home contrivances need cleaning and oiling. Window fastenings and doors that are difficult and noisy to move at nights, the wheels on which the sash lines run, will repay the few moments' attention given regularly. Although oil is necessary in most cases it may be made into a paste with blacklead for large machines, and is also a capital thing for the bicycle chain. Blacklead alone is an excellent substitute for the oil-can—in fact, it is the only lubricant that can be used with safety on the runners of drawers; it makes them glide out quite smoothly and without jarring. Any wooden article that has to be drawn out on a groove is easier to pull out if only a blacklead pencil is rubbed on the runners.—M. M.

Apply Potash Salts Early.

The application of potash salts does not always produce the anticipated good results, and a German professor has conducted trials to asceratin the causes of such failures. His experiments have led him to the conclusion that the potash in the fertiliser is absorbed by the plant more quickly than the acids with which the potash is combined in the fertiliser. The acids are left in the soil and make it sour. He found that the use of lime with kainit and other potash salts was very beneficial. Potash salts do best in soils plentifully supplied with lime, and should be applied—kainit especially—in the autumn so that the lime may have time during the winter to combine with the acids in the fertiliser, and carry them down out of the reach of the plants.

Sweetening the Meat Barrel.

Before butchering time, look well to your meat barrels, if you would have success with your winter supply of pickled meats. Here is one method of sweetening the barrels that is recommended by one who has tried it: After washing and scalding and rinsing until you think the barrel is perfectly sweet, fill the barrel half full of sweet, clean hay, pour boiling water on it, covering the barrel at once to keep in the steam. The water must be boiling, and there must be plenty of it. Let it stand covered until cold, and you will find it will not taint the meat.

It is a matter of note that can be easily verified, ride through the country as you will, whenever you pass a live stock farm, it looks better, has better improvements, the soil conditions are better and in every way appears more prosperous than the farms that are given over wholly to the production of grain and other products that are sold off the farm in the raw state.

A cow's pedigree is proof that she ought to be a good cow, not an absolute proof that she is one.

MAXWELL'S HIGH SPEED CHAMPION

See How the Whole Top Opens Up

The Wringer Board extends from the side, out of the way of the cover. This allows the entire top to open—makes it easy for you to put in and take out clothes—gives you plenty of room to work.

MAXWELL'S HIGH SPEED CHAMPION is the only washer with this big opening. It is also the only washer that can be worked with a Crank Handle at the side as well as with the Top Lever.

The Tub is RED CYPRESS—the wood that grows in water and is unaffected by water. Red Cypress will last a lifetime.

Maxwell's High Speed Champion is the best constructed, the easiest running, the handsomest finished washer on the market.

Write us for catalogue if your dealer does not handle it.

Biggest Bargain in the Province

228 acres in rich hay and famous apple section; only 3-4 mile to P. O., near store, school and advantages; 50 acres machine-worked fields; brook-watered pasture for 30 head; 50 acres heavy wood and timber; 8-room painted house, nearly new, commodious barn, maple shade, good view; 300 bushels potatoes and 2 1-2 tons hay have been harvested per acre; $1900 is the remarkably low price, a tremendous sacrifice for quick sale.—E A. STROUT FRAM AGENCY, Wolfville, N. S.

If your children are subject to attacks of croup, watch for the first symptom, hoarseness. Give Chamberlain's Cough Remedy as soon as the child becomes hoarse and the attack may be warded off. For sale by all Dealers.

Winnipeg Show.

The Winnipeg Exhibition of 1911 was favoured by good weather and an attendance that gave receipts of $16,000 more than last year. Hackneys were few. Whitedale Swell, owned by Mr. Neil A. Love-Carman, was first. For best Mare Mr. J. A. Knott won with Lady Cleidere, a dark bay, almost black, a seven-year-old, and a good square mover. Magnetic by Caxton won for Brood Mare. A good pair of Yearling Fillies by Inverness Royalist were shown by Mr. Alex. Steele. Ponies were a good class, Shetland and Welsh being favourites. The Harness classes were better filled.

The Clydesdales were a great class. Sir Wm. Van Horne, from his East Selkirk farm, sent many winners. Lord Ardwell by Barron's Pride was his champion stallion, and his big roan mare Lady's Pride by Baron o' Buchlyvie was the champion mare, and with her mate, another roan by Sylvander, made the best heavy draught pair an the ground. The Shires were few, seven stallions and two mares. Six of the stallions were shown by Messrs. F. Schroeder and Son. They were by Quania, Harold, Grand Chief, Bodenham King, and Childwick Champion. Percherons, where competing for Heavy Draught classes, were beaten by the Clydesdales. For best five Heavy Horses, Any Breed, Age or Sex, Sir Wm. Van Horne won with Clydesdales against George Lane with Percherons; and in the Province contest for best ten, Manitoba with Clydesdales beat Alberta with Percherons.

Spraying Potatoes.

As the result of an experiment carried out by the Agricultural College at Wye and the University College at Reading, with the main object of deciding—

(1) Whether early or late spraying is the more profitable,

(2) Whether spraying twice is more profitable than spraying once,

The following conclusions have been arrived at:—

1. That spraying late in the season is more profitable than that which is carried out at an earlier date.

2. That spraying once has given better financial results than spraying twice.

3. That Scotch seed potatoes have given better results as regards yield and disease resisting powers than Irish seed of the same variety.

Flues Should be Kept Cleaned Out.

In most cases where we read of a house being burned down in the country "a defective flue" or "a burned-out stovepipe" is given for the cause of the fire, and if the truth were known in many instances the collection of soot in the smoke passage is the direct cause. Sometimes this catches fire and so heats the pipe or flue that it sets fire to the surrounding shingles of the roof or leaks through some small aperture in the pipe or flue. At other times it burns so intensely that the flames leap out at the top of the chimney, the sparks falling on the roof and setting fire to the building.

Most of these costly accidents could be easily avoided by keeping the flues and pipes well cleaned out, especially during that part of the year in which so much fire is needed. Some set the soot on fire and watch it to prevent its setting the house on fire, but this method is too dangerous, as the wind is liable to rise or a spark be overlooked on the shingles. As winter approaches all pipes should be taken down, unjointed and thoroughly cleaned out, a small brush on the end of a light stick serving the purpose very well. Great care should be taken when putting the pipe back up, that every joint is so put together that not the slightest spark can creep through.

In cleaning out chimneys the best method is that of securing a small rope or strong cord, twice the length of the flue, and tying a piece of cloth in the middle of it. This cloth should be of such a size that it will brush against the sides of the flue when drawn through the smoke passage. Arrange a large box or a tub just under the stovepipe hole in the ground floor room to catch the soot. One person should be situated at the top of the flue on the roof, another in the room containing the stovepipe hole. Drop one end of the rope from the top of the chimney, letting the person below secure it and pull the rag down the smoke passage. This will loosen and brush down the soot. The operator at the chimney's top then may draw the cloth back up the passage, which further loosens the soot, when the person in the lower room again draws it down the chimney, continuing thus till it is brushed out clean. The cavity just below the point where the stovepipe enters the chimney also must be kept well cleaned out; if it is not it will be but a very short time till the accumulation of soot in it will begin to pile up and roll back down the pipe, blocking the draught and causing the stove to smoke and not draw as it should.—M. A. Coverdell.

$325.00 Piano
AND
$100.00 Cash
GIVEN AWAY
Absolutely Free
In this great puzzle contest

VALUE $325.00

1st Prize---MAGNIFICENT UPRIGHT PIANO AND STOOL TO MATCH. VALUE $325.00
(It is on view any business day from 9 to 5 at our factory.)

Shubenacadie, N. S.

Let The Book Shown Below Tell You How The Peerless Incubator And The Peerless Way Can Double Your Profits

WE publish a handsome book which tells all about The Peerless Way. This book, "When Poultry Pays," must not be confused with The Peerless Way. It does not contain the plans, working-drawings, specifications and blue-prints that go with The Peerless Way. But it does explain—and fully—just how you can put The Peerless Way to work for you. It gives statistics showing the condition and possibilities of Canadian poultrying; tells how the Peerless Incubator and Brooder were evolved at the Poultry Yards of Canada, Limited, and how these and other things we learned about Canadian poultrying, made our own farm the most successful of its kind in Canada; and it tells, further, the story of a poultry system that is revolutionizing poultry raising in this country. The book is too expensive to send out haphazard; but if you are interested in "poultry-for-profit," have a little money, the average amount of common-sense and the willingness to look after your business, send us the coupon and we will send you one copy. Remember, we are not offering you any "something-for-nothing," or "get-rich-quick" plan, but we are offering a straight, legitimate, business proposition, which, if you go into it seriously as it deserves to be gone into, can double and treble your profits from poultry, and raise it from a side-line of your farm, to your most profitable branch of agriculture. Do you care to—

LET THIS INCUBATOR AND THE PEERLESS WAY MAKE POULTRY RAISING YOUR MOST PROFITABLE BRANCH OF AGRICULTURE

YOU can do it—can do just what 20,846 other farmers and poultrymen have done and are doing in Canada to-day. You can adopt The Peerless Way, take the Peerless Incubator and Brooder and with the experience that we have spent years in acquiring and which we offer you freely, double or treble your poultry-profits. Per head of population, the United States produces three dollars of poultry products to every dollar's worth produced in Canada. That means Canada should produce $75,000,000 worth instead of $25,000,000 worth. Canada is an under-supplied poultry market with rising prices—for example, seven years has seen the price of eggs alone just doubled. We have been so blinded with big things in Canada, that we have overlooked how really immense some of the smaller things are. The Peerless Way affords a real way to increase poultry-profits.

Let The Peerless Way Teach You Exactly What Profitable Poultrying Really Means

THE profits in any enterprise don't come from the amount of capital invested; profits come from knowledge of what to do—and, even more important—what not to do. As operators of the Poultry Yards of Canada, Limited, the largest and most successful poultry farm in the Dominion, we are prepared to teach you how to make money in poultry. You can either come to Pembroke and take a course at our poultry farm here by paying a small fee for the course—or we will teach you through the mail free all about the methods we have made so successful.

Let The Peerless Way Show You How You Can Meet The Climatic Conditions of Canada In Poultrying

OVER half the failures in poultrying in Canada are due to improper methods. Incubators, brooders, poultry-houses, etc., built for warm climates, never have and never will give, in the cold winters of the Dominion, the full possible results. The Peerless Way is the only system of poultry raising that gives recognition to this important fact. The Peerless Incubator and Brooder has been specially designed and built for Canadian use and the blue-prints and working-drawings furnished for the erection of poultry houses, are made from houses that have actually been used and proven successful on our own poultry farm at Pembroke.

Let The Peerless Way Show You About Co-operative Marketing And Higher Prices

MORE money for your poultry and eggs—that's the secret of greater profits! To followers of The Peerless Way—those 20,846 poultrymen who use Peerless Incubators and Brooders and have adopted our methods,—we have taught co-operative marketing. We have shown them how to get top-notch prices for large or small quantities of poultry or eggs, and how to sell to the best advantage. Working along the lines that we have proven to be so successful, is making an increased revenue from poultry. You, too, can have the benefit of all our experience; for our Poultry Advisory Board is ready to teach you all these things. They are ready to give you freely all the experience that has taken them years of toil and exhaustive study to acquire, ready to set you in the right track and enable you to make profits right from the minute you start. But there is not room here to tell you all about it—the book will do that. Send us the coupon and we will send you, postage paid and without charge, "When Poultry Pays".

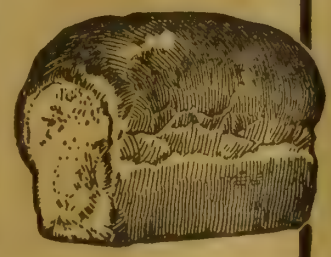
You will be proud of the bread you'll make with PURITY FLOUR



AFTER seeing a batch of big, golden-crusted, snowy-white loaves, that you have baked from PURITY FLOUR, you will, indeed, be proud of your cooking-ability—and proud of your wisdom in deciding to pay the little extra it costs to procure such high-class flour. You will admit, too, that we are justified in the pride we take in milling this superb flour.

PURITY FLOUR

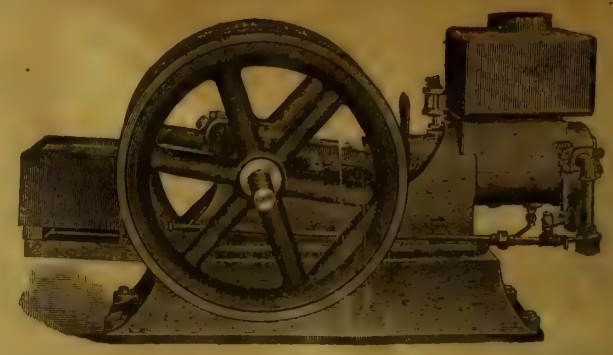
"More bread and better bread"

PURITY FLOUR is milled exclusively from the best Western hard wheat—the world's finest. More than that, PURITY FLOUR consists *entirely of the high-grade portions of the wheat.* The low-grade portions are separated and excluded during the PURITY process of milling. Such high-class flour, of course, expands more in the baking. It makes "*more bread and better bread.*"

It makes lighter, flakier pastry, too, if you just take the precaution to add *more* shortening. On account of its unusual strength PURITY FLOUR, for best results, requires more shortening than ordinary flour.

Progressive dealers, everywhere, sell PURITY FLOUR and take pride in recommending it.

Add PURITY FLOUR to your grocery list right now. 106



The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

DE LAVAL
CREAM SEPARATOR

NEW AUTOMATIC OILING

The most important Cream Separator improvement since the introduction of the present type of De Laval machines.

The new automatic oiling De Laval Cream Separators are now being supplied in all sizes, and this improvement constitutes another great step forward in cream separator construction — the one thing possible in betterment of the previous De Laval machines of the present type.

The new system of De Laval automatic oiling is distinctively different from any other splash or spray system in that there is a constant regulated feed of fresh oil and discharge of used oil. Other splash systems use the same oil over and over, until it soon does more harm than good.

In the new automatically oiled De Laval machines all gears, shafts and bearings practically float in a mist-like spray of oil and literally never touch each other during their operation.

De Laval agents will be glad to exhibit the new machines and demonstrate the working of the new automatic oiling system, which more than ever enhances De Laval superiority in every feature of cream separator practicability.

Farmers Ought to Know

That

MOLASSINE MEAL

Is the only Stock Food Containing Molasses that can be fed freely to horses, cattle, sheep and pigs without fear of injury.

IT IS NOT A MEDICINE, REMEMBER, BUT A PERFECT FOOD made from an English moss, to which has been added the STRONGEST and BEST that the VEGETABLE KINGDOM HAS TO GIVE for producing in cattle more and better beef and larger quantities of richer, creamier milk. Fed to sheep, it makes better mutton and a higher grade of wool, while in hogs, it ensures choicer pork and more of it. Horses fed on MOLASSINE MEAL are stronger, healthier, stand more hard work and their coats are always fine, soft and glossy.

IT IS CHEAPER to feed your live stock on MOLASSINE MEAL, because THEY BRING THE BEST PRICES, and are READY FOR MARKET SOONER.

HORSE BREEDING LEGISLATION.

Shall We Label Our Stallions?

An Address by Prof. M. Cumming Before the Recent Nova Scotia Farmers' Association at Yarmouth, N. S.

A Prize Winning Clydesdale Stallion

Showing Quality of Bone and "Feather" and Sloping Pasterms Typical of the Scotch Breed of Draft Horses.

I DOUBT if there is a single person in Nova Scotia who is satisfied with the present status of horse breeding in the province. Those who have money to buy good horses, cannot get them and those who are producing and selling horses, realize that they could make much greater profits if they could only breed the right sort. What can be done to improve the present state of affairs ?

Unquestionably, there is more private enterprise directed towards horse improvement in this province than ever before. Besides, the Government has accomplished a good deal by importing high class stallions and mares, which have been distributed through the province, as well as by maintaining a first-class stud at the Agricultural College, Truro. Can anything more be done ?

Whatever is done must be done by either private enterprise or the State. Moreover, everyone agrees that, no matter whether the state interferes or not, private enterprise must be relied upon if great results are to be achieved. It may be, however, that just as, in the control of society, the State passes laws which make it necessary for everyone to live up to a certain legal standard, so, in the realm of horse breeding, the state should pass laws to compel each individual to do that which is in the highest interest of the horse breeders as a whole. It is in this connection that many countries and provinces and states have passed Legislation aiming at the compelling of all horse raisers to breed to approved pure bred sires. Should any such Legislation be passed in Nova Scotia ?

A Grade Hambletonian Stallion.

Shown at his home and hitched back of the cart in which he "Travelled for Service," is 13.3 hands in height and weighs 650 pounds. The owner says "Billy is not for sale at any price"

There are those, who would unhesitatingly answer the question in the affirmative and there are those who would, with equal promptness, say No ! The latter would say : You can educate us, you can show us how to feed and care for our horses, you can so demonstrate the value of the pure bred sires that we cannot fail to be impressed with the lesson ; but you have no right to compell us to follow your example. If we are determined to produce ordinary horses or even bad horses, it is none of your business. This is a free country and we will do our own will.

Those who favor remedial Legislation say : The prosperity of the country, and so the good of the people as a whole, demands a better class of horses ; the mass of the people will not improve their horses unless they are practically compelled to ; besides, the State owes it to protect the interests of those who have invested their money in high class stallions. This latter point may require elucidation.

A private citizen, actuated partly by personal and partly by altruistic motives, invests his money in a high class pure bred stallion, calculated to improve the stock of the country. In order to reimburse himself, he has to charge a higher stud fee than ordinarily prevails. But he is able to say to his clients : The stock from this horse will generally be so much better than from those cheaper horses that you will be paid back many times for your small extra fee. The best breeders of the country appreciate his enterprise and patronize him. But the majority (we have to say it) will consider the little extra present outlay and will patronize the cheaper horse. The result is that the owner of the pure bred horse does not get enough patronage to pay him for his investment and unless he is a very keen horseman and can afford to lose money, may cease from his efforts to improve the stock of his country. And more follows for, if this horse is a good sire, colts of his, the progeny of grade mares, will succeed him in the country and his pure blood will become diluted until it loses almost all its impressiveness. Then everybody suffers. Those, who want good horses, cannot get them and those, who need remunerative prices for the horses they raise, cannot get them. The stock is too inferior. We can think of instance after instance where such has been the history of the efforts that have been made by private citizens to improve the stock of the country.

Three-Year-Old Percheon Stallion "Shoking".

Winner of Breed Championship at Wisconsin State Fair.

Now I realize that there may be readers of this article who will seek to off-set the very essence of the argument by stating that grade sires are just as good and oft times better than pure bred sires. By way of anticipation of any such criticism, let me only remind such readers that in those countries of the world where horse breeding is carried on extensively on a paying basis, the pure bred sires is "King". Consider, if you will Kentucky in the United States. LaPerche in France, the Clydesdale, Shire, and Thorobred breeding countries of England and Scotland, in fact all those countries of the world where horses of uniform excellence are bred. No other argument is required. The facts of

An Unsound Stallion "Retired from Service."

Note Ringbone on Left Hind Pastern

An Unsound Stallion "Retired from Service."

Note [illegible]

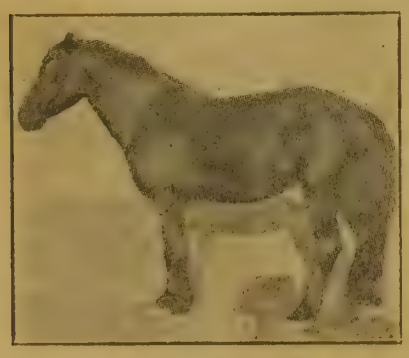
An Unsound Stallion.
Note crooked, unsound hock joint.

history, past and current, point in no uncertain way to the paramount importance of the pure-bred sire, free from hereditary unsoundness.

We have, thus, briefly indicated the problem and will proceed to discuss Legislation. Let it be understood, however, that we are not, at this stage, pretending to advise the Government to Legislate. Rather, we aim to provoke discussion and perhaps interest people in the matter. For, no matter what Legislation the Government may pass, if there is not public sentiment behind it, it cannot be made effective. Do the people of Nova Scotia want such Legislation passed in the interests of horse improvement? Or, do they believe that the end can and will be accomplished by other means—education for example. What think you horse breeders of Nova Scotia?

In considering the problem, it will assist to learn what is being done in other countries of the world. In France, in addition to establishing studs, the Government carries on a system of public Veterinary Inspection. Government Veterinarians examine stallions for unsoundness and classify them according to merit into different classes. If the horses prove unsound they are excluded from public service. If they are up to a certain standard they are designated as "Subsidized" and a cash bonus, ranging from $60 to $100 per year is paid the owner for keeping them in the country available for public service. Horses of not quite so good grade are designated "Authorized," and the owners are given a card which is a Government recommendation of the sires to farmers. A third class is designated "Approved," of which there are but few. They are permitted to be in service, but neither bonus nor special certificate is given to them. Since 1885, the Government has excluded from public service all stallions not coming within these classes. Somewhat similar Government control exists in several other European countries.

In America a large number of the States of the Union have passed laws with a view to controlling the stallions of the country and in Canada, similar legislation is enforced in Manitoba, Saskatchewan and Alberta. The most complete system of Legislation and that from which other States and Provinces in America are more or less patterning their systems of Legislation, exists in the State of Wisconsin. As the Wisconsin Legislation is considered one of the standard systems of America, we herewith submit it too. For the benefit however, of those who do not care to read the full law, we preface a brief abstract of it.



A Mistake.
A certain Stallion owners idea of the qualities and characteristics entitling a grade Shire to be returned and used for public service, note that the characteristic feather of the Shire breed is missing from this horse's legs.

ABSTRACT OF THE WISCONSIN STALLION LAW.

No person shall offer for public service any stallion unless his name is enrolled by the Department of Horse Breeding, of the College of Agriculture, University of Wisconsin. This certificate of enrollment must be prominently printed in every bill or poster used for advertising such horse. Such certificates of enrollment make provision of enrolling stallions in four classes: 1,—Pure-Bred; 2,—Grade; 3,—Cross-Bred; 4,—Non-standard. In accordance with this law a man advertising, for example, a grade stallion would have to put, as the very first words, on his poster, the words, in large type—"The Grade Stallion; etc."

In order to obtain such license, the owner must either swear or obtain a Veterinary certificate that his horse is free from hereditary unsoundness. The presence of such unsoundness disqualifies him for public service.

Following is the law in full:

Unsound Stallion.
Unsound from Side-Bones said to be caused by "wire cuts."

THE WISCONSIN STALLION LAW WITH AMENDMENTS AND ADDITIONS.

"Original Act, approved April 22, 1905, Chap. 116, Laws of 1905; Amendment approved June 27, 1907, Chap-437, Laws of 1907; Amendment, approved June 9, 1909, Chap. 317, Laws of 1909.

Section 1494-31. No person, firm or company shall use or offer for use for public service in this state any stallion or jack unless and until he shall have caused the name, description and pedigree of such stallion or jack to be enrolled by the department of horse breeding, of the college of agriculture, University of Wisconsin, and shall have procured a certificate of such enrollment from said department and shall have recorded the same in the office of the register of deeds of the county in which such stallion or jack is to be used for public service.

Section 1494-32. 1. In order to obtain the license certificate herein provided for, the owner of each stallion or jack shall make oath before a notary public or any officer duly authorized to administer oaths that such stallion or jack is, to the best of his knowledge, free from hereditary, contagious or transmissible unsoundness or disease, or in lieu thereof, may file a certificate of soundness, signed by a duly qualified veterinarian, who shall be a regular graduate of a recognized veterinary college, or by a registered veterinarian who shows proof that he was in practice in this state for a period of five years prior to the year 1887, and shall make oath to said certificate before a notary public, or an officer duly authorized to administer oaths, and shall forward this affidavit or veterinarian's certificate, together with the stud book certificate or registry of the pedigree of the said stallion or jack and other necessary papers relating to his breeding and ownership to the department of horse breeding of the college of agriculture.

2. The presence of any one of the following named diseases shall disqualify a stallion or jack for public service:

Cataract; amaurosis (glass eye); periodic ophthalmia (moon blindness).

Laryngeal hemiplegia (roaring or whistling).

Pulmonary emphysema (heaves, broken wind).

Chorea (St. Vitus' dance, crampiness, shivering, string-halt.

Bone spavin; ringbone; sidebone; navicular disease.

Bog spavin; burb, with curby formation of hock.

Glanders, farcy; maladie du coit; urethral gleet; mange; melanosis; and the department of horse breeding is hereby authorized to refuse its certificate of enrollment to any stallion or jack affected with any one of the diseases hereby specified and to revoke the previously issued enrollment certificate of any stallion or jack found on investigation by the department to be so affected.

Unsound Hock Joint.
This stallion was patronized last seas on.

Section 1494—32m. When a complaint is made to the department of horse breeding that a stallion or jack is unsound and, an investigation and examination is by the department deemed necessary, such examination shall be made by the graduate veterinarian in charge of the department, or his accredited graduate veterinary deputy; but the owner of the stallion or jack shall have the right to select some recognized graduate veterinarian to act with the veterinarian representing the department, and the said recognized graduate veterinarian, on receipt of such notice, shall so act jointly with the veterinarian representing the department, and in case these two shall fail to agree they shall appoint a third graduate veterinarian to act as referee, and his decision shall be final.

Section 1494—33. The officers of the department of horse breeding of the said college of agriculture, whose duty it shall be to examine and pass upon the merits of each pedigree submitted, shall use as their standard of action the stud books and signatures of the duly authorized officers or the various horse or jack pedigree registry associations, societies or companies recognized by the department of agriculture, Washington, D. C., and shall accept as pure-bred and entitled to a license certificate as such, each stallion or jack for which a pedigree registry certificate is furnished bearing the signature of the duly authorized officers of a government recognized and approved stud book.

A Grade Stallion.
Note lack of proportion and symmetry.

Section 1494—34. The owner ol any stallion or jack used for public service in this state, shall post and keep affixed during the entire breeding seasons, copies of the license certificate of such stallion or jack, issued under the provisions of the next succeeding section, in a conspicuous place both within and upon the outside of every stable and building where the stallion or jack is used for public service at his home or elsewhere.

Section 1494—35. The license certificate issued for a stallion or jack whose sire and dam are pure breeding and the pedigree of which is registered in a stud book recognized by the government department of agriculture, shall be in the following form:

University of Wisconsin,
College of Agriculture,
Department of Horse Breeding.

CERTIFICATE OF PURE BRED STALLION OR JACK.

No .....

The pedigree of the stallion or jack (name .....

(Signature) .....
Dean of the College of Agriculture.

3. The license certificate issued for a stallion whose sire and dam are pure bred, but not of the same breed, shall be in the following form:

University of Wisconsin,
Department of Horse Breeding,
College of Agriculture.

CERTIFICATE OF CROSS-BRED STALLION.

No. .....
The pedigree of the stallion (name) .....
Owned by .....
Described as follows:
(Color) .....
Foaled in the year.....has been examined at the College of agriculture and is found that his sire is registered in the .....and his dam in the .....
Such being the case, the said stallion is not eligible for registration in any stud book recognized by the department of agriculture, Washington, D. C.
(Signature) .....
Dean of the College of Agriculture.

4. The license certificate issued for a "Non-Standard Bred" stallion shall be in the following form:

CERTIFICATE OF NON-STANDARD BRED STALLION.

No. .....
The pedigree of the stallion (name) .....
Owned by .....
Described as follows:
(Color) .....
Foaled in the year.....has been examined at the College of agriculture and it is found that the said stallion is not eligible to registration as Standard Bred, and for the purpose of this license is not pure bred, although recorded in the Non-Standard department of the American Trotting Register.
(Signature) .....
Dean of the College of Agriculture.

5. The license certificate for a stallion that has neither sire nor dam of pure breeding shall be in the following form:

Two Splendid Prize Offers

One for Shepherds and One for Potato Growers

Do You Keep Sheep at a Profit?

Here is $50.00 to Tell What You Do.
To the Shepherds we are offering $50.00 for articles telling *How I make a profit with Sheep.*

THIS is an opportunity for shepherds who have been successful in starting and operating a flock of sheep on a commercial basis. There are men with capital living in cities who have expressed a desire to engage in sheep raising on a commercial basis and for their information as well as that of our farmer readers who are planning to engage in sheep raising more extensively, the articles we want must deal with the cost of land, fencing, pasture and forage crops, buildings, cost of help, farm equipment, management, marketing and alll other incidentals leading up to a well equipped sheep farm.

We want you to tell the MARITIME FARMER *readers how you do it.* Give the number of sheep in your flock, breed, percentage of lamb crop, feeding methods and general care and management of the flock. We want the accounts clear, interesting and helpful. You do not have to confine yourself to the questions suggested, you are at liberty to give any information that you think would be helpful to other sheep breeders. No story is to contain more than 5000 words.

The Prizes Will Be Awarded as Follows:

$25.00 for the Best Story	3.00 for the Fourth Best Story
15.00 for the Second Best Story	2.00 for the Fifth Best Story
5.00 for the Third Best Story	$50.00 in All for the Contest

To facilitate reading, all manuscripts should be typewritten if possible. If this is out of the question they should be written in ink, clearly and neatly. They should be written on only one side of the paper. Postage need not be enclosed, as manuscripts will not be returned under any circumstances.

We hope to receive a great deal of valuable and interesting material in response to our offer. And we must reserve the right to withold any or all of the prizes if we do not feel that the contestants have succeeded in reaching the standard of excellence that we require. However, we expect excellent material that will be well worth our offer. This contest will be open till March 20th, 1912. No stories received after that date can be considered.

Do You Grow Potatoes Successfully?

Here is $50.00 If You Tell How.

THE most vital potato growing question today is how to grow the largest crop for the least money. Some farmers have made a study of this question and have learned by practical experience. THE MARITIME FARMER wants to hear from these men. So it offers $50.00 for the best five articles which wlll tell

How I Grow Potatoes on a Business Basis.

Each article must not exceed 5000 words. The story must be a real one of actual achievement explaining the various details in connection with the practical work involved in securing the best results.

We Want you to tell the MARITIME FARMER *readers how you do it.* Give a statement of the value of the land, how the land is prepared and fertilized, kind and quantity of fertilizer used, methods of planting, cultivating, spraying, harvesting, marketing, and the place the potato crop occupies in your system of crop rotation. We want the accounts clear, interesting and helpful.

The Prizes Will be Awarded as Follows:

$25.00 for the Best Story	3.00 for the Fourth Best Story
15.00 for the Second Best Story	2.00 for the Fifth Best Story
5.00 for the Third Best Story	$50.00 in All the Contest

CERTIFICATE OF "MONGREL OR SCRUB" STALLION.

No. .....
The breeding of the stallion (name) .....
Owned by .....
Described as follows:
(Color) .....
Foaled in the year.....has been examined at the College of agriculture and it is found that the said stallion is of mongrel breeding and is therefore not eligible for registration in any stud book recognized by the department of agricultdre, Washington, D. C.
(Signature) .....
Dean of the College of Agriculture.

Section 1494-36. Each bill and poster issued by the owner of any stallion enrolled under this act, or used by him or his agent, for advertising such stallion shall contain a copy of the stallion's Certificate of enrollment printed in bold face type not smaller than long primer on said bill or poster and the first mention theron of the name of the stallion shall be preceded by the words "pure-bred", "grade", "cross-bred", "non-standard bred", or "mongrel or scrub," in accordance with the wording of the certificate of enrollment; and it shall be illegal to print upon the poster any misleading reference to the breeding of the stallion his sire or his dam or to use upon such bill or poster the portrait of a stallion in a misleading way; and each newspaper advertisement printed to advertise any stallion for public service shall show the enrollment certificate number and state whether it reads "pure-bred", "grade", "cross-bred", "non-standard bred", or "mongrel or scrub".

Section 1494—37. A fee of two dollars shall be paid to the horse breeding department of the college of agriculture, University of Wisconsin, for the examination and enrollment of each pedigree and for the issuance of a license certificate, in accordance with the breeding of the stallion or jack as above provided; and a renewal license fee of one dollar shall be paid to the department of horse breeding every other year from the date of the issuance of the original license certificate.

Section 1494—38. Upon a transfer of the ownership of any stallion or jack enrolled under the provision of this act, the certificate of this enrollment may be transferred to the transferee by the department of horse breeding of the college of agriculture upon submittal of satisfactory proof of such transfer and upon payment of the fee of fifty cents; and a fee of fifty cents shall be paid for a duplicate license certificate issued where proof is given of loss or destruction of the original certificate.

Section 1494—38m. The department of horse breeding shall keep an account of all moneys received and disbursed and shall make an annual report thereof, said report shall be published with and as a part of the annual report of the Agricultural Experiment Station, college of agriculture.

Section 1494—39. Violation of any of the provisions of this act is hereby made a misdemeanor and shall be punished by a fine not less than ten dollars nor more than fifty dollars or by imprisonment in the county jail not more than sixty days or by both such fine and imprisonment; and it is hereby made the duty of the district attorney of the county in which the violation takes place to prosecute the action."

In reviewing this law, the reader will note that the Wisconsin Government does not make it illegal to travel a grade stallion. It does make it illegal to keep for public service a stallion that has certain unsoundnesses (see Sect. 2), that are recognized to be hereditary. But under this law the man who keeps a grade stallion

ORDER YOUR SEEDS EARLY.

The excessive heat of last summer injured to a very large extent many of the seed crops, particularly, Beet, Carrot, Sugar Beets, Mangels, Parsnips and Peas. Planters should exercise the greatest care in ordering their supply of seeds this year, as many low-grade, old stocks will be offered. It's a good plan to send to reputable seed houses for their catalogues and then order your seed early in the year. As their stocks run down the seedmen will naturally fill orders with whatever they have on hand and it is safe to assume that the best seeds will be the first to go out. Another advantage in ordering seeds early is the opportunity it affords of testing their germinating qualities. If they do not test satisfactorily they can be exchanged and other seeds can be obtained in time for early planting. Still another consideration is the danger from delays in transit. This is particularly true in sections where the transportation facilities in many of the communities are rather slow. It is a safe plan for the farmer to make up his seed order right away. He can plan his spring work with profit in advance and thus get a good start. Many men are apt to put off ordering seed until the last minute with the result that they get the culls and have to plant without testing, besides running the risk of their seeds arriving too late or not arriving at all.

A CONTEST FOR THE BOYS IN THE GROWING OF FARM CROPS.

Prof. M. Cumming informs us that a former Nova Scotian, now living in New York, seeking to lend his aid to the improvement of agriculture in his native province, has made arrangements with the Department of Agriculture at Truro for two contests in the growing of Turnips ; one in Colchester County and the other in Cumberland County. The complete details have not yet been drawn up, but we are in a position to announce the general features.

Briefly, any boy between 14 and 20 years may enter, provided the assessed value of his guardian's property does not exceed a certain amount (probably $3,000). Prizes will be given for the best crop of turnips that can be grown on one acre of land, and the prizes are substantial ones. 1st $100 ; 2nd, $50 ; 3rd $25. The donor has wisely provided that the prize money must be spent in some definite way, to be agreed upon by the Committee placed in charge of the contest, who are to be Charles Hill, Central Onslow; F. L. Fuller, Truro; M. Cumming, Truro. When the judges, who will be appointed by the Local Department of Agriculture, announce their decision, this Committee will confer with the prize winners and arrange that the money be spent in one or the other of the following lines : 1st, In pursuit of an agricultural education. 2nd, In purchase of improved stock. 3rd, In under drainage. Probably other options will be added.

The full particulars of this contest will be available shortly but, in the meantime, any one who is interested should write Mr. F. L. Fuller, Agricultural College, Truro, N. S.

To properly plow the land, cultivate and harvest an acre of turnips will cost from $45 to $70. The crop will brobably average 900 bushels and for stock feeding purposes will be worth, at least, $90, and will oftimes realize more when disposed of in the local market. The boys will, therefore, be amply repaid, even if they do not gain a prize. But the fortunate ones who win a prize will certainly have a most substantial profit for their year's work.

Come on boys of Colchester and Cumberland and get ready for the contest.

SHALL WE LABEL OUR STALLIONS ?

At the Nova Scotia Farmers' Association held in Yarmouth, January 23rd to 25th last, Prof. Cumming, Secretary for Agriculture, discussed Horse Breeding Legislation. He showed that in nearly all the European countries and in 18 States of the U. S. A., and in Manitoba, Saskatchewan and Alberta, in Canada, there are in force more or less drastic systems of legislation aiming at the improvement of the horse breeding business. He quoted as the pattern legislation for America that which is in operation in the State of Wisconsin. According to this Wisconsin Legislation, all stallions used for public service must be enrolled in the Agricultural Department of the University of Wisconsin. They are to be enrolled in one or other of the following five classes : 1, Pure Bred. 2, Grade. 3. Cross Bred. 4, Non-Standard Bred. 5, Mongrel or scrub. And to quote exactly, "no person, firm or company shall use or offer for use for puplic service in this State any stallion until he shall have caused the name, description and pedigree of such stallion to be enrolled," etc., and further "each bill and poster issued by the owner of any stallion enrolled under this act or used by him or his agent for advertising such stallion shall contain a copy of the stallion's certificate of enrollment, printed in bold face type, not smaller than long primer, on said bill or poster, and the first mention thereon of the name of the stallion shall be preceded by the words "pure bred" or "mongrel or scrub," etc."

According to this law, it is further declared illegal to travel a stallion that has any of the hereditary unconsciousness, such as spavin, etc.

In other States of the Union and in Canada the Legislation is sometimes more and sometimes less drastic than the foregoing, but the essential feature which the Nova Scotia Farmers' Parliament unanimously agreed should be put in force in this province is that all stallions should be labeled as to whether they are pure bred, mongrel, etc., and also as to what unsoundness they possess. According to this it would be legal to travel any stallion, but the owner is compelled to let the public know exactly what he is.

When this law was put in force in Wisconsin in 1905, there were enrolled 35 p. c. pure bred stallions and 65 p. c. grade or mongrel. Last year there were 52 p. c. pure bred and 48 p. c. mongrel or grade. The result has been to enlist public sentiment to gradually drive out these scrub stallions. The ultimate result will be to prepare the way for more drastic Legislation.

Prof. Cumming's address on this subject appears in this issue. We trust the horse breeders of Nova Scotia will openly come forward and express their view on this matter.

Now that the Nova Scotia Farmers' Parliament has declared itself so unanimously in favor of such Legislation, we seek to ascertain the feeling of the rank and file of the horse breeders of the Province. Shall we label stallions ? What say you, horse breeders of Nova Scotia ?

BOOM THE MARITIME PROVINCES.

S. S. "Ula,"
Singapore, India,
Dec. 18th, 1911.

The Secretary,
St. John River Valley Farm & Fruit Land Co., Ltd.

Dear Sir :

Having seen your advertisement in the Colonizer, and being desirous of obtaining further information regarding the fruit and farm lands you have for sale ; I shall be much obliged if you will forward me full particulars. Will you also inform me the capital required to start on a good basis ; kindly address care of B. I. M. S. Club, Post Box 35, Calcutta, India.

I am, Yours sincerely
(Sgd) W. S. Broome.

When people in foreign claims are beginning to sit up and take notice of the possibilities in Maritime Canada is it not high time for the fathers of our land to do their usmost to keep their boys on the farm? Take the boys into your confidence ; give them a share in your business ; you will be more successful ; the boys will be better contented and very soon the strangers without our gates will hear more of the East and will be induced to come and cast their lot in Maritime Canada.

Nova Scotia Farmers' Annual Convention

(Continued from last issue).

COUNTY ASSOCIATION REPORTS.

KINGS COUNTY.

Mr. W. H. Woodworth reported for Kings County as follows:—

In making our report, for the year 1911, we can again report progress. County Farmers' meetings have been held in Kings County for the past eight years, and from their inception the farmers have taken a great interest in them.

To one living in the country, very many improvements can be noticed, and farmers, in large numbers, are ready to bear testimony to the usefulness of the Institute Meetings.

Among the things learned by farmers are: More thorough cultivation of the soil, The economic use of fertilizers, Sowing of cover crops, Growing larger crops of roots, Maintaining the humus in the soil and the rearing and caring for a much better class of dairy cows and draft horses. Large numbers from the county attend the Short Course at Truro and several young men are taking the full course. We held a seed fair and conducted an excursion to Truro. Our membership is large and we try to secure the best men as lecturers.

We are not satisfied yet with what we have accomplished and we are anxious to see more practical work done. Our farmers, in several localities, are asking for a monthly meeting. Ladies' institute meetings are talked of, and we hope the day is not far distant when steps will be taken to enlarge the work.

LUNENBURG COUNTY.

was reported for by M. B. DeLong:—

1911 has been the most successful year since our Association was formed. Our membership, 164, was the largest in our history. This number entitles us to four delegates. We held eleven meetings including 'our Annual Meeting, with an attendance of 445. These meetings were addressed by W. H. Woodworth and L. D. Robinson of Berwick, and some of our local men.

At all of these meetings we had lively discussions along the lines of farming in all its phases. The effects can be seen all through the country in the raising of better vegetables, grain and fruit.

Some years ago the dairy school visited our country, and we have seen a marked change in the butter making. The people would like to have it come around again next Summer.

Our Farmers' Association is being more appreciated every year. Over one hundred and thirty of our members subscribed for the Maritime Farmer last year, and we expect to have more subscribers for this year.

PICTOU COUNTY.

Mr. Howard Kennedy reported for Pictou County. Eighteen meetings with an average attendance of thirty-three had been held. The large mining and manufacturing interests in Pictou County were problems that Pictou County farmers had to contend with as the greater majority of the young men were drawn away from the farms. The County Association was, however, taking steps to interest the boys in the possibilities of the farm and he hoped for good results.

QUEENS COUNTY.

Mr. Hunt, of Queens County said the County Association had purchased a Babcock Milk Tester and some of the members were availing themselves of the opportunity of testing their cows. They were planning for monthly meetings in the various districts of the County and a qiarterly meeting of the County Association.

YARMOUTH COUNTY.

Mr. S. P. Goudey, gave the following report of the year's work in Yarmouth County:—

During the year just closed, we have held 15 meetings, with a total attendance of 1463. Three of these were addressed by Harvey Mitchell, New Brunswick. Eleven regular and one special meetings were entertained by local talent.

Our membership for the year was 251.

Our regular picnic was held in August. About 2000 attended. Professor Cumming was the principal speaker. The proceeds from the last four picnics have been applied to purchase land and erect sheds thereon, at Dayton. We have had 12 splendid sheds and land enough to build twelve more upon and are free from debt.

We feel that we are doing good work, with the milk testing department of our Association. About 200 samples are tested annually, which shows that our people are keeping an eye out, for the cow that does not pay her board.

Our Association imported its usual quantity of seeds. Owing to the very dry season, some of these did not give as large returns in crops as might have been hoped for. The members are persistent, however, and have ordered another supply for 1912.

Twelve good men and true have been selected to entertain the members, at their regular monthly meetings during the year, and their subjects have already been assigned to them. These men are expected to open the questions and also to provide some entertainment of a social nature.

We are hoping for splendid results during the year upon which we have entered. If all who are interested in Agriculture will become members of our Association and render us what assistance they can, the success of our institution will certainly be assured.

NOVA SCOTIA AGRICULTURAL SOCIETIES.

Mr. F. L. Fuller reported the standing of the Agricultural Societies by Counties. There are two hundred Agricultural Societies in the Province an increase of thirteen during the year. The total membership is 8576 an increase of 261. The total amount subscribed is $13,137.45 an increase of $405.00. The Government aid to these Societies amounts to $10,000.00.

THE PARLIAMENTARY COMMITTEE'S REPORT.

The Committee appointed at the 1911 Annual Meeting to interview the Government re the resolutions passed by the Nova Scotia Farmers in Annual Convention last year reported:

The Government will give assistance to any man or company of men, to introduce a ditching machine in any county in the Province.

The Government did not feel inclined to take any action re the extermination of the Ragwort in Eastern Nova Scotia.

Owing to the shortage of revenue caused by the strikes in some of the Collieries, the Government is unable to increase the Grant to Agricultural Societies.

The Government agreed to render assistance re the Exchange System of Sires and the Superintendent of Agriculture Societies is now in a position to take action in the matter.

The Government is convinced that a Dormitory for the N. S. A. C. is a necessity and is inclined to favor the building of one as soon as the finances of the Province will permit.

The Committee interviewed the Superintendent of Education and the School Inspectors, and they favored inaugurating a scheme by which the teachers in the rural schools would receive instructions in the teaching of Agriculture, and would receive an increased grant for doing so.

The Committee interviewed the Manager of the Provincial Exhibition and the Commission subsequently decided not to increase the entry fees.

Re Agricultural training in the rural schools, Prof. Cumming announced that as a result of this matter being brought to the notice of the Government by the farmers' representatives, thirty-seven teachers will this year receive an increased grant for teaching Agricultural Subjects in their schools.

Exercising The Bull.

The above system for exercising a bull is self explanatory. A stout post is driven in the centre of the yard and a long arm is then bolted across the top of the post, in such a way that it revolves readily as the bull who is attached to one of the ends of the arm walks around in a wide circle

HORSE BREEDING LEGISLATION

was the subject of an interesting paper read by Prof. Cumming on Wednesday afternoon. The substance of this paper is published in full on other pages of this issue.

After considerable discussion by Messrs. G. Nichols, A. S. McMillan, W. W. Black, F. W. Foster, R. J. Messenger, C. C. H. Eaton, Wm. O'Brien, Wm. Murray, J. R. Webster, Andrews and F. L. Fuller, whose general trend of opinion was that the time has come when the scrub and unsound sire should be legislated out of existence, a motion favoring such legislation was unanimously carried and a committee consisting of Messrs. A. S. McMillan, Wm. O'Brien, W. W. Black, D. R. Nicholson and F. L. Fuller was appointed to bring in a resolution re this matter for presentation to the Government.

THE VALUE OF THE PROVED SIRE.

Prof. J. H. Grisdale, Director of Dominion Experimental Farms, followed the discussion on Horse Breeding Legislation with an address on The Value of the Proved Sire. He linked his address with the Horse Breeding Legislation question which had just been discussed and congratulated the Association for the progressive steps they had assumed re this matter.

The Value of the Proved Sire was too often overlooked. The sire was half or more of the herd. The points to look for in the selection and retention of a sire were conformation, breed type, vitality, fertility, prepotency and impressiveness.

The performance of a sire's progeny was, however, the main proof of the value of a sire and the guage by which he must be measured when the time arrived for his retention or disposal.

It was a grave mistake to dispos? of young sires until they had been weighed in the balance of the performance of their offspring.

Mr. F. L. Fuller said a large percentage of the bulls owned by Agricultural Societies would be improved by having their keeping methods improved. Thr bull was more than half the herd. The 200 Agricultural Societies in Nova Scotia kept 350 bulls. The average age at which these bulls was bought was fifteen months and the price in the vicinity of $100.00. These bulls were rarely kept after they become four years old and the average price at which they sold was in the vicinity of $50.00.

Mr. R. J. Messenger thought one of the reasons why bulls were not kept until they were older was that very often they became vicious through confinement and lack of exercise. He had stretched a heavy wire between two trees. On fine days he was accustomed to attach the bull's tie chain to a sliding ring on this wire and as the bull walked back and forth from tree to tree he got ample exercise.

Mr. F. W. Foster said that the choice of a sire was either the making or the marring of a herd. He was a firm believer in giving a bull a lot of exercise. The method he followed was to make the bull pump the water, separate, churn, etc., by putting him on a one horse thread, the power by which his various machines are driven.

Discussions re Farmers' Banks and Rural Telephones occupied the remainder of the Wednesday afternoon session.

PROBLEMS CONNECTED WITH CREAM GATHERING CREAMERIES.

was the subject of an interesting address, on Wednesday evening by Mr. Geo. H. Barr, Chief of the Dairy Division, Ottawa.

The two main essentials for the successful operation of a Cream Gathering system of Dairying, the only ideal way, were honest makers and the co-operation of the patrons. The speaker showed up the advantages the Cream Gathering systems had over the Whole Milk gathering systems. He strongly advocated the delivery of a rich cream as by that system the amount of skimmilk lost to the farm was reduced to a minimum. He illustrated his address by the use of carefully prepared charts. One chart showed the value of butter fat lost in skimmilk from a herd of forty cows in one year:

Value of butter fat lost in one year when separator is carefully handled and in a normal condition, $24.45.

Value of butter fat lost in one year when separator is washed only once per day, $48.91.

Loss when milk is too cold when separated at say 60 degrees F., $58.69.

Loss when separator is run 20 revolutions too slow, $102.17.

He also showed the temperature and acidity of cream kept in water and ice at different periods.

He had visited the creamery that is in course of construction at Yarmouth and urged all the dairymen within its reach to patronize it. The creamery was being built and equipped along modern lines and the young men who were responsible for its erection deserved all the encouragement Yarmouth County farmers could give them.

Mr. Barr's lecture was followed by a selection rendered by the Yarmouth Male Quartette after which Mr. W. A. MacKay, Manager of the Scotsburn Creamery spoke of the natural facilities for dairying in Nova Scotia. Progress had been slow in the past but the future showed gleams of hope in the rapid development of this important industry. He gave a history of the manner in which dairying is progressing in Pictou County after which Prof. E. S. Archibald delivered an interesting talk on the

BUSINESS PRINCIPLES OF WINTER DAIRYING.

Suitable feeds for summer and winter feeding, breeding, testing, weighing, weeding and many other incidentals connected with the profitable management of a dairy herd producing milk under winter conditions were discussed. Much interest in Prof. Archibald's address was evidenced by the questions which came thick and fast from all parts of the hall and to which the Professor made instructive replies.

THURSDAY MORNING.

The election of officers for the ensuing year resulted as follows:—

President—R. M. Jackson, Jacksonville; Vice-President—H. W. Corning, Chegoggin; 2nd, Vice-President—Wm. O'Brien, Windsor Forks; Directors—R. J. Messenger, Bridgetown; A. S. McMillan, Upper South River; G. R. Nichols, Berwick; Daniel McDonald, Sylvester and Samuel Freeman, Amherst; Secretary-Treasurer—Mr. C. R. B. Bryan, Durham; Auditors—Profs. J. P. Landry anh E. S. Archibald, Truro; Exhibition Commissioners—Messrs. R. S. Starr and W. W. Black; Legislative Committee—Wm. O'Brien, C. H. Black and W. H. Woodworth.

RESOLUTIONS.

Whereas, in 1909 and 1910 there was a larger number of live stock imported into Nova Scotia, through the Port of Yarmouth than through the port of Halifax, and

Whereas, Western Nova Scotia is in serious need of a quarentien station, with suitable accomodation for all kinds of live stock,

Therefore resolved, that this Nova Scotia Farmers' Association request the Hon. Martin Burril, Minister of Agriculture, to provide such a station at Yarmouth, in the interest of the live stock men of Western Nova Scotia.

* * *

Whereas a number of our Nova Scotia Farmers are going to Ottawa to attend the Fruit Growers' and Live Stock Conventions from Feb. 12th to 16th,

Therefore resolved, that the N. S. F. A. empower these delegates to approach the proper authorities at Ottawa to press the claims of Nova Scotia for more aid in advertising and extension of her Immigration Policy.

* * *

Whereas, the Ragwort and other noxious weeds are alarmingly spreading in the eastern part of Nova Scotia, and it has been demonstrated by experiments made by the Department of Agriculture of the Dominion of Canada, that tne Ragwort has been the cause of the Cattle disease, and,

Whereas, it has been demonstrated that this noxious weed may be exterminated by sheep at the same time thriving thereon, and

Whereas, we believing sheep to be among the most profitable stock on a farm, and regarding with apprehension the diminution of the sheep raising industry in this province, and believing that the eastern part of Nova Scotia as a whole to be best adapted to sheep raising and being the area at present most infected with Ragwort. Therefore we, the Nova Scotia Farmers' Association, in session at Yarmouth, recommend that the Dominion Government, having already done considerable work along the line of investigating the noxious weed question, be memorialized through our federal representatives, requesting that body to establish an Experimental Sheep Station somewhere in Eastern Nova Scotia with a view to stimulating the sheep raising industry.

* * *

In the opinion of this Association the time has arrived when the Government of Nova Scotia should enact legislation making it compulsory for owners of Stallions, the service of which are offered to the public, to have said Stallions classified and enrolled.

* * *

Whereas, the production of beef in Nova Scotia has diminisned to such an extent, that our farmers are not producing sufficient to supply its own wants, and

Whereas, we believe that in the interests of both consumer and producer alike, some steps should be taken to impress upon our farmers the benefits to be derived by further development of this most important branch of Agriculture, and

Whereas, demonstrations stations for the purpose of fattening cattle, hogs, sheep and poultry are the order of the day in many parts of this Continent, and

Whereas, our Federal Government through its Premier, Hon. R. L. Borden, has placed itself on record as being convinced that the time has come when greater aid and encouragement should be given to the basic industry of agriculture, and that to this end a measure will be introduced, under which it is hoped that there may be co-operation between the Dominion and the various Provinces for the purpose of assisting and encouraging farmers to secure the best results in production, and at the same time preserve the fertility of the soil.

Therefore be it resolved, that in view of the suitability of the Province of Nova Scotia for fattening cattle by reason of its excellent pastures and the large production of hay, much of which is now exported, a practice much to be deplored, and against the principles of the maintenance of the soil fertility; that this Nova Scotia Farmers' Association desired to place itself on record as being in favor of the establishment of such Demonstration Station, and

Further resolved, that a copy of this resolution be sent to the Minister of Agriculture at Ottawa.

* * *

Whereas, considerable dissatisfaction obtains regarding the high tolls and curtailed advantages given the Subscribers by the Maritime Telephone Co.

Therefore resolved, that the Nova Scotia Farmers' Association ask the Provincial Government if possible to take over the telephone system of the Province, and operate the same for the betterment of the people.

* * *

Whereas, as compared with the financial aid given to other provinces of the Dominion for advertising and Immigration purposes, Nova Scotia is not receiving her proper proportion of money, and,

Whereas, the Immigration Department at Halifax is seriously handicapped in placing the advantages of our province before possible settlers because of the limited appropriations which the local government can afford,

Therefore resolved, that the Nova Scotia Farmers' Association do petition the Immigration Division of the Federal Department of the Interior to give more attention and larger appropriation to encourage immigration to our Province.

* * *

The Committee to whom Exhibition Commissioners' Report was referred for action reported as follows:

1st. We recommend that the commission use their own judgment with regard to the number of days that the general features, including horse racing, be carried on; but we strongly urge them to consider the advisability of limiting the number of days during which live stock be kept on the grounds from Saturday to Thursday.

2nd. We recommend that the Commission provide better accomodations for exhibitors and attendants of live stock; to be specific that a shed which need not cost more than $200 be erected and fitted with sleeping bunks, and with sufficient room for placing oil stoves, etc., for cooking.

3rd. As a means of increasing the attendance, we would recommend that the commission devote special attention to securing cheaper railway and lodging rates, the latter of which prominently advertised would undoubtedly bring a larger number of visitors.

4th. We recommend that the Government repeal the legislation prohibiting the use of the plant for purposes other than the Provincial Exhibition, and that the commission be enpowered to rent the grounds for any legitimate purpose with the understanding, however, that all proceedings be under the same control as now exists in connection with the exhibition.

SHEEP BREEDING IN THE DOMINION OF CANADA.

was discussed by Mr. W. T. Ritch, of the Sheep Commission. He gave an interesting account of the work done by the Commission and went into the details of sheep management in the various countries that had been visited by the commission. had been visited by the Commission. His talk on wool and cross breeding methods was much appreciated. He would have the practice of tub washing wool done away with as it was an antiquated system. Wool should be sold in the grease and care should be taken that every fleece was tied up properly and separately, so that the manufacturers could sort out the various grades, a matter which is impossible when wool is tub washed at home. When this system prevails in Canada better wool prices will be realized..

Considerable discussion on the value and profitableness of keeping sheep took place at the close of Mr. Ritch's address. Mr. C. C. H. Eaton contributing an interesting share by relating his own personal experience in the sheep raising industry. ...

At the close of the discussion on Sheep, the meeting adjourned to take advantage of a chance to visit some of the most important industries of the town and the Lawndale and Hillside Farms owned by Dr. Lovitt and H. W. Corning, M. P. P. respectively.

THE CLOSING SESSION

took place on Thursday evening. Past President Woodworth retired the various persons who had so ably the Association.

new President, R. M. Jackson.

An address by Prof. J. H. Grisdale on The Formation and Cultivation of the Soil and a Paper on Varieties of Fruit Suitable for Outside the Annapolis Valley interspersed with some solos by Mrs. D. R. Saunders were the concluding features of the programme.

Prof. Shaw's paper appears on another page of this issue. We hope to publish Prof. Grisdale's address at a later date.

Before adjournment was made hearty votes of thanks were tendered to the various persons who had so ably helped to entertain the members of the Association.

The Yarmouth County Farmers' Association did nobly and well. Everything that could possibly be done to make the delegates' stay in Yarmouth as profitable and pleasant as possible was attended to in a kingly manner. The unanimous verdict of each and every member of the Association as they returned to their homes was that the reception received was fully in accord with the hearty invitations that have gone fortn asking the Nova Scotia Farmers to make Yarmouth their next meeting place.

Canadian Guernsey Breeders in Annual Session.

The annual meeting of the Canadian Guernsey Breeders' Association was called to order by the President, Daniel G. McKay, in the Winter Fair Building, Amherst, N. S., on December 6th. Minutes of previous meeting were read and approved.

The minutes of an Executive meeting of Dec. 7th, 1910, were also read and by motion adopted.

The President made a short address much appreciated by all present.

Mr. E. J. Johnson, Vice-President, also gave a very encouraging address.

The Secretary-Treasurer, H. W. Corning, submitted his annual report and financial statement, which were by motion adopted and ordered placed on record.

SECRETARY'S REPORT.

Officers and Members Canadian Guernsey Breeders' Association:—

In looking over the past year your Secretary feels justified to state at this our eleventh annual meeting, that our Association has made healthy progress during the year ending Oct. 31st, 1911. Your Secretary, as per order of the executive committee, corresponded with the Minister of Agriculture and the Secretary of the A. G. C. C. seeking the equalization of the Canadian and American record books for Guernseys. This correspondence I will read later.

The tabulated pedigree has been arranged and is now in the hands of the breeders. A list of those recommended by the executive as being capable of judging Guernseys was sent to the different Canadain Fair Boards.

The Guernseys made a better show ing at the Maritime Province Fairs in fall of 1911 than ever before, and the demand for them is steadily increasing, which surely shows that they are gaining favor in the estimation of the Canadian dairymen.

Arrangements are being made to send an exhibit of Guernseys from the Maritime Provinces to the Ont. and Quebec Fairs in the fall of 1912.

The Canadian Record of Performance work is gradually being taken up by our breeders although there are others who should now be entering their cows.

We have had the privilege of publishing the records of the first seven cows that have qualified, and there are others that are under test from the herds of your President, D. G. McKay, Heath Bell; John N. Chute, Berwick, N. S.;Henry Cooper, Chilliwack, B. C. Experimental Farm, Ottawa, and H. W. Corning.

There are others who are about to enter cows. There, surely, is no better way to attract more of the attention of the Canadian dairymen than to show them by actual tests that our Guernseys can produce a greater quantity of higher quality dairy products, for the feed consumed, than any other dairy breed.

The Financial sheet which I will now submit also shows progress.

After reading of communications, Mr. J. F. Roach, of Sussex, N. B., spoke to the question sent to the meeting for a ruling by the Accoun-

tant of National Live Stock Records, concerning the fee for registering Canadian bred Guernseys, born since the opening of our Canadian Record for Guernseys that were recorded in the American Guernsey Cattle Club Records. Mr. Roach claimed that as he read "eligibility" in the constitution, all American registered Guernsey cattle should be admitted for the fee of fifty cents, but the Accountant had charged him $1.00 for recording a Canadian born, American registered animal, simply because the animal had been dropped since the admission of Guernsey cattle to the National Live Stock Record.

After considerable discussion by James F. Roper of Charlottetown, P. E. I.; R. Robertson, Nappan, N. S.; John McDonald, Shubenacadie, N. S.; E. J. Johnson, George's River, C. B.; J. F. Roach and Howard W. Corning, the following resolution was unanimously passed:—

Whereas, "eligibility" in constitution reads—"Animals recorded in the Herd Register of the American Guernsey Cattle Club may be re-registered in the Canadian Register at a nominal fee of fifty cents," and

Whereas, our constitution cannot be amended unless "at a meeting of the Association called for that purpose," and

Whereas, the Canadian National Live Stock Records commenced to register Guernsey Cattle about January 1st, 1906,

Therefore resolved, that the Secretary advise the Accountant to admit all American registered Guernseys to our Herd Book for the year 1912, "at the nominal fee of fifty cents per head."

Further resolved, that the Secretary prepare a clause to amend "Eligibility" in the constitution providing that all Canadian bred Guernsey cattle, born since January 1st, 1906 be required to pay a fee of $1.00 for registration in the Canadian Records, and that a notice of motion to so amend the constitution be sent each member with his notice of the next annual meeting.

Mr. D. Drummond of the Record of Performance, told of the very practical way that his department was about to adopt, to ascertain the exact amount of food fed the cows under test, and he hoped by carefully watching the feeders to be able to give the Canadian dairymen an idea as to what the average profit was over the feed cansumed by the cows under test. On being asked, if the strict enforcement of the rule, compelling all cows admitted to Record of Performance to produce a calf within fifteen months of the commencement of test, was not in his opinion apt to bar out some good cows, Mr. Drummond said, that while the rules in the Record of Performance for Canadian cows would not allow the making of such large records as were made by some American record associations, the Canadian Department of Agriculture could not encourage anything but regualr breeding for Canadian cows.

A resolution was passed instructing the Secretary to correspond with the Hon. George H. Murray, Premier of Nova Scotia, requesting that a herd of high class Guernsey cattle be added to the dairy stock of the Government Farm at Truro.

Moved and passed that Principal M. Cumming be requested to secure a number of Guernsey cattle to represent the Guernsey breed at the short course of 1912.

Moved, passed and ordered that the Secreatry supply stationery for use, to the officers and directors.

Election of officers resulted as follows:—

Hon. President—Sydney Fisher, Knowlton, Que.; President—D. G. McKay, Heathbell, N. S.; Vice-President—E. Jf Jahnson, George's River, C. B.; Directors—T. D. Bates, Middle Stewiacke, N. S.; J. F. Roper, Charlottetown, P. E. I.; R. M. Jackson, Jacksonville, C. B.; J. F. Roach, Sussex, N. B.; Hugh Dickson, Central Onslow, N. S.; Auditor—R. Robertson, Nappan, N. S. Mr. James F. Roper was elected Director to act with the President, Vice-President and Secretary on the executive qoard. Committee A—President, D. G. McKay; Secreatry, H. W. Corning.

Growing and Marketing Seed Potatoes

On Pioneer Farm, Upper Sackville, N. B.

C. Fred Fawcett.
Prop. Pioneer Farm, Upper Sackville, N. B.

Editor Maritime Farmer:—

In response to a large number of farmers and friends scattered throughout this country, I will endeavor in a short article to put into print some results we have obtained with our farming operations on "Pioneer Farm" last season.

First, we started to dig up an old orchard. This cost us $5.00 for the man and tools for pulling up the trees. There were about fifty fairly large trees. We accomplished this in one day. Another day was spent in hauling away the rubbish. The plough followed after; then the potato planter and this fall we dug sixty barrels of potatoes where the apple orchard stood last winter. The apples were of fairly good quality but we never got many of them, as hunters and boys helped themselves. This fall we got all the potatoes. This was of considerable satisfaction to us and we consider it a much more profitable use of the land.

We put about ten acres in potatoes this past year. Our hired help for the spring's work on our two farms of about forty acres cleared, amounted to about $100. A man was employed only a part of the summer, the wages amounting in all to about $75.00. Our paid help for the fall's work of taking out our crop and marketing same amounted to $185. Fertilizer on our potatoes cost us $350. This with the cost of sets, clover seed, etc., etc., amount to the total expenses of operation. Our crop consisted of nearly 1000 bushels of grains, about 15 tons of clover hay with one half acre of fodder corn, three-quarters of an acre of turnips and 1300 barrels of potatoes. Looking back over our season's operations we find good reason for satisfaction. Our catch of clover was the best ever seen in this vicinity. Many have spoken to me about this and by their interest they show their appreciation. Of course, as many know, we make a specialty of selected seed potatoes. Our special seed plots of this year gave us most splendid results. Many of these hills planted with one whole round potato gave us ten pounds of marketable tubers when dug. The best hill contained 34 tubers, 28 of which were marketable and weighed 11½ pounds at time of digging. We invited our friends in the forenoon we dug this plot and they did the actual work for us. We were successful in marketing two cars of our potatoes to an Ontario seed house at satisfactory figures. We secured first prize on a standing field crop of barley while our oats were lower down in the list owing to a very severe rain and wind storm just before judging. We used on one field of oats some Nitrate of Soda after the grain was up. This gave us very satisfactory returns. On another field as an experiment we used some potash. The difference between treated and untreated places was very marked. Another thing that is very apparent to a close observer in raising potatoes, with fertilizer especially, is that our outside rows and end hills are most often our best producers. The cause of this, we think, is more sunlight and we find by practice that potato rows should be fairly wide apart.

Our season's work makes it plain to us that more intensive methods, heavier fertilization with plenty and often crops of clover are good standards of farming to follow.

CAN ANY OF OUR READERS EXCEL THESE RECORDS?

In the late papers I notice quite a how-do-do is being made of the fact that Alfred Hutchinson, of Mount Forest, Ontario raised 200 bushels of potatoes per acre in his 1911 field work. This is shown up as being a very high and creditable average and no doubt, it is for that country. From what I have seen and heard in Ontario, it would be a good yield.

Now the point I wish to draw your attention to is that a good many who are supposed to have the good of the country at heart do not wish to recognize the fact that New Brunswick seed taken to Ontario and planted there gives about double the yield given by Ontario grown seed. But still, Ontario farmers keep their money for seed potatoes and continue to send us train loads of feeds, seeds, etc.

I have been and am working along the line of forcing their attention to this fact. Prof. Zavitz is intensely interested in this movement and has been getting his supply of seed for experimental purposes from me and some of my neighbors, for several years. He is going to make the results public when the proper time comes and I think it will make things interesting for some potato growers. The Vegetable Association of Ontario will not listen to me much.

I know Mr. Hutchinson by correspondence and we are both much interested in each other's work. We are going to exchange some seed this year so we can have the benefit of each other's work.

My best plot this year yielded 375 bushels per acre, in field work—quite a contrast to Mr. Hutchinson's yield.

I have been trying to get the Ontario seedsmen to handle my seed potatoes but they dislike to get out of the old rut of buying their supply in the United States, paying heavy duties and then charging about $2.00 to $2.50 per bushel. We can put first-class seed stock down in Toronto in the fall, for about 60 cents to 65 cents per bushel. The results already obtained with our seed show the wisdom of buying our seed. I have got so far as to have the preference of any grower in New Brunswick, from, at least, one seed house and, of course, I am anxious to get in on the ground floor as much as possible because it will make a fine thing for us here and we can co-operate in growing and we can supply No. 1 seed.—C. Fred Fawcett, Upper Sackville, N. B.

Editor's Note:—We have personally visited Mr. Fawcett's farm and were much impressed with the enthusiasm he displays in his work. He is conducting his farm on business principles. From a small beginning he is rapidly mounting the steps that lead to successful achievement. He is not afraid to invest money in any piece of machinery or scheme that will lighten his labors or advance his business along modern lines. Would that many more of our young men were so ready to boost their country and its resources as Mr. Fawcett is. What a change there would come over the Maritime Provinces during the next decade.

The "word of mouth" system of agreement is antiquated, not but people are just as truthful now as they ever were but word of mouth agreements are not business like.

POTATO SALE CONTRACT

MEMORANDUM OF AGREEMENT made between C. FRED FAWCETT of Upper Sackville, in the County of Westmorland in the Province of New Brunswick, hereinafter called the Vendor, of the one part, and ..... of ..... in the County of ..... in the Province of ....., hereinafter called the Purchaser, of the other part.

The Vendor agrees to sell to the Purchaser and the Purchaser agrees to buy from the Vendor the following goods, on the terms and conditions following, that is to say:

Following is the form of contract adopted by Mr. Fawcett for sale agreements.

POTATOES OF THE FOLLOWING VARIETIES:

Early Ohios

1. All goods sold in bulk unless otherwise specified, and quotations are on car lots.

2. The word "about" is to be construed as meaning at least four-fifths the quantity specified and not more than six-fifths of the quantity specified.

3. Carload lots are to be taken as meaning five hundred bushels or over to capacity of car.

HORTICULTURE.

The Best Varieties of Fruit for Outside the Annapolis Valley.

The best varieties of fruit for any locality depend on what succeeds there and what the fruit is intended for, whether for home use or the market. In selecting the trees for an apple orchard, where the fruit is to be sold, some six or seven of those varieties, which grow well in that locality and which are wanted in the market, should be taken. If the fruit is to be chiefly for home use, a larger number of varieties should be chosen and they should be of the quality which suits the tastes of the family. In the commercial apple orchard, it is well to have varieties which mature at different times and distributed from the first of the picking season to the last, so as to make the harvesting easier. In the home orchard, varieties should be chosen so as to give a succession of fruit throughout the year, from August around till June. Why should not this healthful article of diet, the apple, be present in every home eleven months in the year?

In the Annapolis Valley the leading commercial varieties include the Gravenstein, Ribston, Blenheim, Cox Orange, Baldwin, Rhode Island Greening, Stark, Northern Spy, Golden Russet, Fallawater, Nonpareil and Ben Davis. Other varieties grown in smaller quantities than most of these are: Astrachan, Yellow Transparent, Duchess of Oldenburg, Williams Favorite, Wealthy, Alexander, Dudley, McIntosh Red and Mann.

The demand in the markets of Great Britain has chiefly determined the varieties to be largely planted in the Annapolis Valley. Scarcely anyone would think of planting extensively in a commercial orchard more than six or eight of these varieties. In Western Nova Scotia, outside the Annapolis Valley, including the counties of Lunenburg, Queens, Shelburne, Yarmouth, Digby and parts of Annapolis, Kings and Hants, wherever apples can be grown, any of these varieties would likely be successful.

For a commercial orchard, a list like the following might be taken: Duchess or Gravenstein (a few) Blenheim or Ribston, King or Wagener, Baldwin or Stark, Northern Spy or Golden Russet, Nonpareil. For a home orchard, Astrachan, Duchess, Williams Favorite, Gravenstein, Chenango Strawberry, McIntosh Red, King, Wagner, Yellow Bellflower, Rhode Island Greening, Northern Spy, Golden Russet and Nonpareil.

For that part of Nova Scotia from Truro eastward, including the Island of Cape Breton, a good list either for home or for the market. is the following:—Crimson Beauty, Astra-Oldenburg, Wealthy, Alexander, Wolf Oldenburg, Wealthy, A,exander, Wo,f River, Dudley, McIntosh Red, and possibly, Baxter and Milwaukee. To this list might be added for some favored parts, like North Colchester and Pictou County, Ribston, King and Golden Russet. The King should be top-grafted onto hardy stock and so should any doubtful, tender variety. I would not advise the planting of Gravenstein or Baldwin from Truro east, although I have seen some fine Gravensteins grown in Inverness County. A few of these varieties might be top-worked onto hardy stock if the grower is anxious to have them. Of this list, the desert apples are: Wealthy, Dudley and McIntosh Red. Also the Ribston, King and Golden Russet. The Crimson Beauty is one of the earliest apples grown. This and also the Astrachan and Yellow Transparent are used as desert apples because of their earliness. The Duchess and Alexander are excellent cooking apples. The Northern Spy is a hardy variety, but requires a long season to reach its best quality, longer even than we sometimes have in the Annapolis Valley. Wherever there is difficulty in getting a variety to reach full maturity, the owner should plant on early ground and he should certainly keep this land cultivated, BEGINNING EARLY IN THE SEASON. This early cultivation causes the tree to start growth earlier, giving the fruit a longer season in which to grow.

Wherever apples of the best quality are grown and where the grower is catering to the high-class trade, the box is a package worth considering. Especially in parts of this Province where, as yet, only a few apples are grown and, consequently, where barrels are not easily obtainable, the box is to be recommended. Anyone can make the apple box, where it takes a cooper to make a barrel. Good desert apples, such as the Wealthy, Dudley and McIntosh Red, can be grown in almost any part of the Province, and they pack well in boxes. It only requires that the grower exercises care in the pruning, spraying, cultivating, thinning, etc., and he will have apples worth packing in boxes. Sich apples carry to market in better condition than in barrels and bring the highest prices.

Among plums, Moores Arctic, Lombard, Yellow Egg, Washington, Bradshaw, Shropshire, Damson, and Saunders are good varieties to plant. The Japanese varieties are not to be recommended. Even the Burbank is too tender, or does not yield well in eastern Nova Scotia.

Good cherries for eastern Nova Scotia are Montmorency, English Morello and Wragg. The Montmorency is the best. These are all sour cherries. The sweet varieeies do not seem to withstand the climate. Governor Wood and Windsor, of the sweet kinds, do fairly well in the western countries, but they are often short-lived and a disappointment there.

I do not pretend to have named all the varieties for the parts of the Province outside the Annapolis Valley. No doubt there are persons present who can name other varieties equally as good as some given above. If I have said enough to start a discussion on this subject, I shall be satisfied.—Paper prepared by Prof. P. J. Shaw and read before the recent N. S. Farmers' Association at Yarmouth, N. S.

Save Your Old Orchards.

Land owners are waking up to the fact that it is easier and wiser to protect the old trees than to wait the long years which must elapse before new ones can grow to take their place.

Tree surgery and tree doctors are with us and have come to stay. In Unites States alone there are some 20 men making the doctoring of individual trees their sole profession, but their terms are so high as to be prohibitive for the average farmer.

Dr. Frank Johnson, a village forester of Illinois, is one of the best-known tree surgeons in the middle west. The treatments and formulas given below are the result of Dr. Johnson's 20 years of experience with the diseases af trees:

The five most dangerous enemies to mature orchard trees are: Unhealed wounds, improper trimming, insects, rot of the heart and the freezing of water gathered in the trunk.

Make a careful inspection of your orchard at least once a month. Broken bark and broken limbs mean dangerous wounds. Trains of sawdust, cobwebs and drops of gum oozing from the bark are sure signs of bores and vicious insects. Hollow crotches or holes, where the water may gather and freeze, need attention before cold weather. Falling yellow leaves are also a danger signal.

Wherever the bark is knocked off or broken, the insects enter, which lay the eggs from which the borers and winged ants hatch. The leaves of your trees turn brown and the small branches die. The borers multiply rapidly and soon kill the entire tree. The winged ants hatch in colonies which are also fatal to the life of the tree. Their entrance can be prevented by sealing the wounds with a tar mixture made from the following formula:

Pitch tar, 5 pounds.
Pure beeswax, 1 pound.

When trimming your trees, you may unwittingly do the most harm. If it becomes necessary to remove a limb, cut it off so as to leave no projection from the trunk or main branch. Nature will heal a wound in a tree just as in a human being, but the new wood ring and bark cannot form over a projecting stump. Cut the limb off close and then chisel it out until the surface of the wood is below the plane of the bark. Seal the wound with the tar mixture to keep the insects out and the bark will grow entirely over the scar.

All of this seems troublesome perhaps. It is, but not half so much as losing your trees. Careless trimming and lack of sealing cause the death of 50 per cent. of our fruit and shade trees.

Wherever you find a cavity which holds water, you may know that rot will soon start and destroy the heart of your tree. Anotner danger from such an opening is illustrated by a fine old apple tree which decayed in the fork. Rot ate out the heart and water gathered in the hollow. Winter came on and the water froze, bursting the entire trunk. Thus a fine old tree whose Russets had been part of family tradition for three generations was lost, when half a day's work would have saved it for another decade.

In our mature orchards 75 per cent. of the trees are suffering from one or all of these evils. However, this is not so serious as it seems. For the growth of a tree is of such a nature that all of these evils can be overcome.

A tree grows only on the outside. The interior or heart strengthens it but contributes nothing to its life. If you find a hole, big or little, in your orchard trees, take a half day for tree surgery and save the years of waiting which a new tree necessitates.

The tools are simple—a sharp chisel, a brace and bit and a mallet are all you will require. Clean out the rotted wood, then bore diagonally into the wood in different directions from the bottom of the hole that the filling may hold. Fill the cavity with the following cement compound:

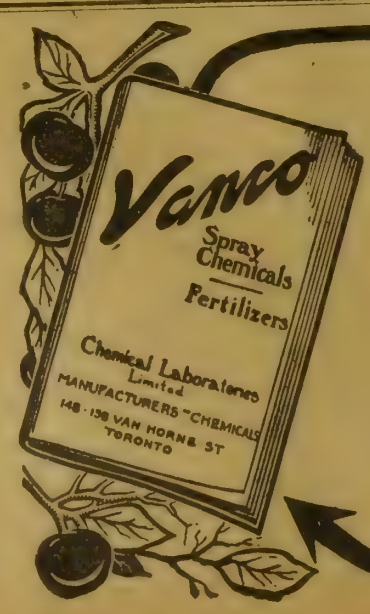
Portland cement, 1 pound.
Sand, 2 pounds.
Cinders, 2 pounds.

Pack the cement in well and seal all around the filling with the tar mixture. Leave no projections beyond the plane of the bark and immediately the wood ring and bark will begin to form over the patch and the tree will ultimately be as good as new. The entire heart of the tree may be cleaned out and filled in this way and the tree will continue to flourish.

This treatment really runs backward, for the best way to save your orchard is to protect the trees from wounds in the first place. Keep nails and spikes out of them. Do not tie ropes or wire about your young trees and do not burn the grass off from an orchard in which you have set out new trees. Three or four days of careful treatment a season will prolong the life of the old orchard indefinitely.—Farm and Home.

Renovating Old Orchards.

Much of the work, and indeed the hardest task connected with orchard renovation, may be done in the fall and on mild days during the winter. There are several reasons why the work should be commenced in the fall, chief of which is that there is more time at that season of the year and the work is likely to be done better than if left till spring, when there are so many other urgent dut-



THIS BOOK READ IN FEBRUARY MEANS PROFITS IN SEPTEMBER.

Vanco Spray Chemicals and Fertilizers.

Vanco Lead Arsenate will destroy all leaf-eating insects—never burns—sticks longer. The largest order ever placed for Spray Chemicals by any Canadian Fruit Growing Co., was for "Vanco" Lead Arsenate.

Vanco Lime Sulphur Solution is strong, uniform, clear, efficient — the strongest perfect solution that can be made. Government Bulletin proves this. Specific Gravity on every barrel, to protect you.

Fertilizers Muriate of Potash — Sulphate of Potash — Acid Phosphate — Nitrate of Soda. We are the only house in Canada selling only straight chemical fertilizers —analysis guaranteed.

BUY WHERE YOU CAN BUY EVERYTHING AND SAVE FREIGHT.

SEND FOR THE "VANCO" BOOK NOW—study it at your leisure, and spray for future profits.

CHEMICAL LABORATORIES, LIMITED, Van Horne Street, TORONTO. 32

ies. Pruning at that time of year gives the large wounds an opportunity to dry out before spring, when they may be more effectively sealed up with paint.

The most important point in connection with the pruning of neglected apple trees is to know how much cutting to do—whether the tree needs dehorning or simply a rigorous pruning. The severity of the treatment will depend largely upon the rigor of the tree. As a general rule, the weaker the tree the more severe the treatment. Complete dehorning is the best treatment for a very weak tree, while the same kind of treatment would probably kill a strong-growing specimen. High-headed trees require more drastic methods than low, spreading individuals.

FORMING NEW HEADS.

With such trees the aim should be to form a new head as soon as possible. This is best accomplished by cutting off the main branches within 1 or 2 feet of the trunk and encouraging the growth of a watersprout or sucker to take its place. If there are no suitably situated sprouts their growth usually may be induced by severe pruning during the dormant season.

With trees that are already supplied with watersprouts, it is a simple matter to select a few of the most desirable ones to form the new head, but when the watersprouts must be produced, it is sometimes difficult to make the selection on account of the vast number to choose from. In either case, they should be chosen with reference to their position rather than their size. Those that are nearest the juncture of the trunk and main branches are most desirable.

With trees that are moderately vigorous some people prefer to encourage the formation of the new head on only one side of the tree at a time, leaving the other side until about two years later. The reason for such treatment is to avoid the severe shock to the tree following the removal of all its main branches. A more satisfactory way consists in giving the tree a very severe pruning and avoiding the dehorning process. The upright growing branches may be removed from the center of the tree and the remaining main branches thoroughly thinned out and moderately headed in. All diseased branches, of course, should be removed. Trees treated in this way will continue to bear fruit and the process of forming a new top is a slower one. The old branches may be removed a few at a time, whenever strong-growing and suitably situated watersprouts appear to take their places. This treatment does not apply to very weak trees, which should always be dehorned.

TRAINING THE WATERSPROUTS.

The work of training the individual water sprouts is very similar to training young trees. The greatest danger is in leaving too many. If a spreading habit is desired, it is necessary to give the young shoots plenty of room. The first year's treatment of the selected watersprouts consists in cutting them back to about four or five buds. Each of these buds may be expected to form side shoots, and these in turn should be cut back to about half their growth. Much may be done in the way of directing the growth of these young shoots by cutting back to a point just above a bud that points in the desired direction. In doing this, however, it is well to keep at least an inch from the selected bud, for the shoot is likely to be killed back for a short distance from the cut surface.

The growth of large branches may be influenced in much the same way, by cutting back to a side branch that points in the desired direction. Furthermore, when cutting back the larger branches it is necessary to cut back to a side branch to insure the healing of the wound. Most farmers nowadays realize the necessity of making close and smooth cuts and avoiding the familiar stubs of old-time practice. Even yet there are some who prefer to cut off a side branch at right angles to itself instead of parallel with the parent branch. The former method makes a smaller wound, but leaves an objectional shoulder that seriously interferes with the healing of the wound.

The smaller wounds, or those less than 2 inches in diameter, will usually heal over before there is any danger from decay and therefore, do not require any further treatment. The wounds over 2 inches in diameter should be protected by paint, but this should not be applied till spring. Ordinary white lead and raw linseed oil is very suitable for the purpose, although some prefer coal tar. On very large wounds it is advisable to tack on a zinc plate, which has been cut so as to cover the woody portion of the wound, leaving the bark exposed so that it will heal over the edge of the plate, making a permanently tight joint. The plate is usually tacked on while the paint is wet, and the tacks are placed near the edge of the plate. Large wounds that are not treated in this way will need to be repainted every year.

Hollow cavities may be treated in the same way by sawing off the surrounding wood, producing a freshly-cut, flat surface on which to nail the zinc. Trees that are badly hollowed out by decay are seldom worth attention, except where they are found around the home and when they possess more than commercial value. The lives of such trees may be greatly prolonged by cleaning out the decayed wood, sterilizing with a solution of copper sulphate, and filling with cement. Cement is necessary only when the tree needs support, for it furnishes no curative effects, as is sometimes supposed.

SPRAYING MAY BE DONE IN FALL

The control of San Jose scale on full grown apple trees is not such a difficult task as was once supposed. In cases of serious infestation, however, it is usually necessary to spray twice, once in the fall and again in the spring. For the spraying of old trees it is generally believed that miscible oil is more suitable than the lime-sulphur wash. By spraying with oil in the fall and the lime-sulphur wash in the spring, good results may be expected.

The former should be used at a strength not less than one to 15, and the latter (commercial brands) not less than one to eight. Either of these preparations may be safely and effectively applied any time while the trees are dormant, providing the temperature is above the freezing point. Thoroughness is the important point in the control of scale, and it should be the aim to completely cover every portion of bark on the whole structure.—Prof. C. D. Jarvis, Connecticut Agricultural College in N. E. Homestead.

A farm that looks prosperous is prosperous. The wise use of paint and varnish adds years to the life of buildings, wagons and implements, and saves you a big yearly loss from rust and decay. Whatever your paint or varnish need around your farm or home, there is a high quality Sherwin-Williams Paint or Varnish that will effectually protect your property.

The Farmhouse will last longer and look better, protected with SWP, Sherwin-Williams Paint, Prepared. Contains only pure lead, pure zinc, pure linseed oil, and the necessary turpentine, driers, and coloring pigments, mixed and ground in the correct scientific proportions by powerful machinery. Look for the "Cover the Earth" trade-mark shown below.

The Buggy properly painted will be in service years after the neglected buggy is past repair. Sherwin-Williams Buggy Paint made in the 9 best colors, will make the saving for you.

The Wagon, The Plow, The Reaper, The Binder and all other tools and vehicles decay and rust when left unpainted. On such use Sherwin-Williams Wagon and Implement Paint, easy spreading, economical and long wearing.

Windmills, Metal Roofs, etc. need special protection. Sherwin-Williams Metalastic is especially made to prevent the decay and rust of metal surfaces.

Barns, Sheds and other buildings of rough lumber can be durably protected by the use of Sherwin-Williams Barn Red—Spreads easily, covers well and resists the weather.

Bridges, Fences and Roofs deserve protection. The refined Creosote Oil in Sherwin-Williams Creosote Paint both preserves and protects at moderate cost.

Floors and Stairs need special attention. The ten handsome shades of Sherwin-Williams Inside Floor Paint are easy to apply, dry quickly, and stand hard wear.

Inside the House Sherwin-Williams Brighten-Up Finishes supply a paint, varnish, stain or enamel for every possible purpose. Write for a complete descriptive booklet.

DAIRYING.

Factoay By-Products.

VARIOUS METHODS OF UTILIZING THE SKIMMILK, BUTTERMILK AND WHEY.

In the manufacture of butter, skimmed milk and buttermilk are the by-products and in cheesemaking, whey is the only remaining substance left. Progressive dairymen are learning to appreciate these useful materials and frequently one hears, that if it were not for the by-products there would be little money in dairying.

The question of the best means of utilizing these by-products must in many instances be governed by local conditions such as convenience to markets and by the market values of the products into which these by-products can be converted.

Skimmed milk is whole milk minus its fat and its greatest use undoubtedly is in the feeding of young animals, particularly calves and pigs and for hens. The value in cash of skimmed milk for this purpose, depends on the value of the animals to which it is fed. Fifteen cents per hundred pounds is probably the minimum value and twenty-five cents the maximum, the value always being increased when the milk is properly cared for. During recent years an outlet has been made for large quantities of skimmed milk in the manufacture of casein, but as yet it does not often yield the farmer as much as he can obtain by feeding the skimmed milk to good calves, hogs, chickens and laying hens. About fifteen cents per hundred pounds of skimmed milk, is as high as most buyers pay for casein above the cost of manufacturc. The time will soon come however, when more money may be realized from this source, as the industries employing and the number of articles made from casein are increasing rapidly.

Immense quantities of skimmed milk are annually made into cheese. A hundred pounds of good skimmed milk will yield about eight pounds of Cheddar cheese, which at times can be sold for as much as ten cents per pound, giving a profit of eighty cents per hundred for skimmed milk. As a general thing however, such cheese sell for about five cents per pound, depending, as with most things, on the quality. Creamerymen located within short distance of towns and cities can usually dispose of considerable skimmed milk in the form of cottage cheese and baker's cheese. One hundred pounds of good skimmed milk yields about fourteen pounds of cottage cheese which retails at from ten to twenty cents per pound when put up in neat packages weighing one-quarter pound each. The small paper pail seems to be a favorite form for carrying cottage cheese. It seems regrettable that a greater use of skimmed milk is not made for food purposes, especially amongst the poorer classes in cities. It is an excellent food for children over one year old and for adults, and if it were sold for one-half tne price of whole milk, many poor families would be greatly benefited and more money would be realized by farmers and creamerymen. The day is not far distant, when the scarcity of whole milk will make the sale of skimmed milk for food a necessity. Towns and cities are offering ever increasing outlets for sour milk drinks and skimmed milk can be profitably utilized for this purpose. In districts where the sale of spirituous liquors is prohibited, buttermilk makes a useful non-intoxicating substitute and the fact that the medicinal effects of buttermilk are so useful in clearing out the bad effects of "booze" makes it an ideal side line for bars and saloons. The greatest outlet for buttermilk is undoubtedly for feeding purposes to hogs and hens. For this purpose it is worth ten to fifteen cents per hundred pounds. Anyone who is fond of buttermilk hates to think of it going to the hogs at this price when it cannot be obtained in the city, frequently at any price. A hundred pounds of buttermilk makes over two hundred glasses, which at five cents per glass gives ten dollars per hundred pounds. A big profit indeed for the retailer.

A very nice grade of soft cheese can be made from buttermilk. It closely resembles cottage cheese but has some additional desirable characteristics and is a profitable side line as about fifteen pounds worth twenty cents a pound retail, can be obtained from a hundred pounds of good buttermilk. The methods of manufacturiog these cheeses and sour milk drinks can be ascertained through late dairy books and bulletins.

Whey is probably the least appreciated of the by-products and yet it represents a tremendous business in itself. The first thing for factorymen to consider in regard to the utilization of whey is the advisability of separating its fat content. This can be determined by testing the whey with a Babcock test and multiplying the fat test by nine-tenths the weight of the milk. This gives the pounds of fat available in the whey and one can easily figure whether this will be large enough to give a reasonable profitable on the money necessary to be invested in whey skimming and buttermaking machinery. Most of the fat from the whey yields greater profit in the form of butter than when fed direct to hogs. One thing is certain, that a pound of milk fat will not put a pound of fat on a hog. Therefore in feeding hogs unskimmed whey, fat worth twenty-five or more cents a pound is fed to produce less than five cents worth of hog meat.

In the average factory, the total cost of a pound of whey butter is about eight cents and in many places a larger profit can be realized by manufacturing whey cream into ice cream, or for regular cream purposes after it has been pasteurized. The great feeding value of whey lies in its sugar content which averages about five pounds in every hundred pounds of sweet whey. One pound of sugar in this form will put just as much or more meat on a hog as a pound of fat will, but the sugar in this form is of smaller commercial value owing to the difficulty of separating it from the other constituents. Pure milk-sugar which is manufactured from whey retails for some forty or fifty cents per pound but the cost of obtaining it is so great the condenseries seldom pay more than five cents per hundred for whey. It is worth at least seven cents per hundred for hog feeding. To obtain the greatest value from the whey however, it must have its sugar content preserved in the best possible condition. This can be accomplished only by pasteurization of the whey at the factory. This adds fully twenty per cent. to the feeding value of the whey and the cost of pasteurization seldom runs over three and one-half cents per thousand pounds. Whey and skimmed milk should always be pasteurized before being returned to the patrons, so that milk carried diseases may not be transferred from one herd to another through this channel. The whole question of the value of the by-products of the dairy in fact, depends on the care they receive and if properly handled they probably yield about as much actual profit as the whole milk itself.—Essay by Charles A. Publow, M. D. of Picton, Ont., awarded first prize in New York State Fair Competition.

Cause of Sour Milk.

Bacteria, ordinarily found in milk, may or may not facilitate the growth of lactic micro-organisms. About 57 per cent. of the associate micro-organisms, when shown in combination with the specific lactic micro-organisms, accelerate their growth and action. The relative number of each micro-organisms introduced into the combination may or may not have a decided influence upon the accelerations of the growth of the lactic micro-organisms of lactic fermentation. Acceleration may occur at the beginning of the fermentation, or at the end, or at any stage between.

The means by which this acceleration of lactic fermentation is produced is not the same in all cases. It appears to be due to products manufactured by the associate micro-organisms, sometimes stable to heat, sometimes unstable; sometimes under alkaline conditions, sometimes under acid conditions; sometimes with apparent digestion, sometimes with no apparent digestion. It is very doubtful wnether these products combine with the inorganic or casein constituents of milk, as is the case of lactic acid, so as to permitlactic micro-organisms to grow more freely.

The period at the beginning of lactic fermentation, during which the number of bacteria is continually increasing may be greatly shortened by vigorous associate bacteria influencing the lactic micro-organisms. Usually the associate micro-organisms disappear with the formation of appreciable amounts of lactic acid, yet the associate micro-organisms may continue or persist, causing an abnormal lactic fermentation.

Associate micro-organisms may influence lactic fermentation by producing "off flavors," "off aromas" and an unusual high degree of acidity. Even the character of the acid may be completely changed. It follows that the elimination of "filth"

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

VELVET CREAM

The wealthiest, most particular and discriminating people on earth use the dining-car service of the great Canadian Pacific R. R., with its ocean-to-ocean trains, and that is why Tubular-made cream alone is served and satisfies the management of that railroad.

It costs them more money, and Mr. John McFadyen's dairy at Parkbeg, Sask., with a Tubular at the head of it, gets the benefit in big profits.

The great New York Central R. R. gets Tubular cream for its dining cars from Mr. Geo. H. Sweet, East Aurora, N. Y., and both the railroad company and Mr. Sweet profit from the velvety Tubular cream.

THE SHARPLES
Tubular Cream Separators
MAKE GREATEST PROFITS

for the keenest, best informed dairymen everywhere. They know they must have Tubulars to get perfect cream and to get it all. Disk-filled or otherwise complicated separators lose cream, spoil its quality and give what is termed a "metallic" or "disky" flavor to it.

Dairy Tubulars contain no disks or other contraptions and produce velvety cream of perfect flavor which brings fancy prices.

Tubulars have twice the skimming force of others, skim twice as clean, wear longer and run easier.

If it's not a Sharples it's not a Tubular, and you are not getting all the profits.

bacteria is the only means of eliminating the product causing lactic acceleration, inasmuch as the products may be so stable as not to be destroyed by ordinary means of milk treatment.

The Origin and Distribution of the Guernsey.

Editor Maritime Farmer:—

During the past few years dairying has made rapid progress in tne Maritime Provinces and we see a greater interest being taken in the different dairy breeds of cattle and also a large increase in the number of pure bred cattle that farmers are keeping.

Perhaps no breed has made such rapid advancement in popular favor as the Guernsey, and this is seen in the large exhibits at our fairs and dairy tests at each one of which they have demonstrated that they have a right to a very high place in the opinion of the farmers of our Maritime Provinces.

The native home of the Guernsey is on the island of that name, one of the Channel Islands situated in the English Channel and distant from France about fifteen miles. The group of islands consists of four large ones: Jersey, Guernsey, Alderney and Sark. It is on the second and third of these that Guernseys are raised. The island of Guernsey is triangular in shape, about nine and one half miles long and six wide at its widest part. Its population numbers about 35,000 and about 5,000 head of cattle are maintained. The climate is very mild the year around and the people, besides raising cattle, make a specialty of growing under glass such crops as tomatoes, grapes, etc., for the London market.

Like many other breeds the origin of this one is somewhat obscure but it is supposed that it is derived from the French cattle of Brittany and Normandy. The dark color and size of the present animals being attributed to the use of bulls brought from the latter place to the island at a very early date.

For many years this breed in its native home has been protected from outside ones as all cattle brought to the island, from any source other than Alderney, had to be slaughtered within twenty-four hours after landing, consequently, we have a comparatively pure breed of cattle and by careful selection on the part of the breeders they have developed a larger breed of cattle than the Jerseys, which are of the same origin, and one that is able to consume a large amount of fodder and convert it into a valuable product.

Guernsey breeders on the Island have long been encouraged to improve their cattle by the Royal Guernsey Agricultural and Horticultural Society, which aimed to bring the breed up to a high scale of excellence. To do this they hold annual exhibitions and the best individuals are carefully inspected and are given a rank according to merit.

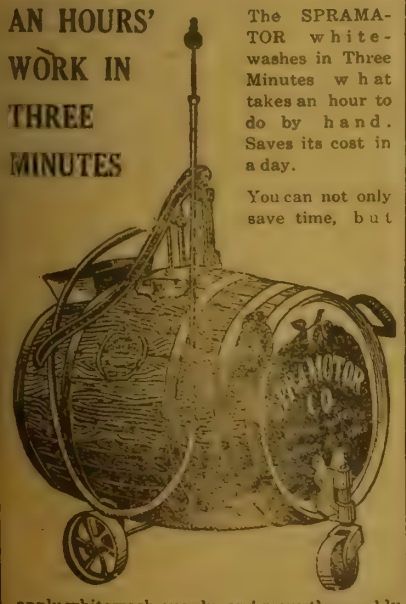
About 1818 we have the first record of the importation of Guernseys to the American continent when a pair were brought from Alderney to Penn. U. S. A. The next importation was made from Guernsey Island about 1830, and the importation has gone on from that time until the present. In 1870 the American Guernsey Cattle Club was orgaized and for some time the Maritime breeders recorded their cattle in this club's books but in 1905 the Canadian Guernsey Breeders' Association was formed and the animals are now recorded in the Canadian National records at Ottawa.

During the early and middle part of the nineteenth century the breed met with rather slow growth on account of the limited number of animals that were imported but in 1893 they attracted a great deal of attention by their record at the World's Columbian Exposition at Chicago and since that their growth has been a rapid and healthy one. At the present time they are distributed throughout the New England States, many of the Central ones, and are rapidly invading the territory on the Pacific slope and we find many herds in California, Oregon and Washington. In Canada we find them strongest in the Maritime Provinces, but they are gradually spreading westward and there are a number of large herds in Quebec and some few in Ontario.—D. G. McKay, Heathbell, Pictou Co., N. S.

AN HOURS' WORK IN THREE MINUTES

The SPRAMATOR whitewashes in Three Minutes what takes an hour to do by hand. Saves its cost in a day.

You can not only save time, but



apply whitewash evenly, and more thoroughly than in any other way, driving the paint in every crack and crevice.

It is easily handled and runs about smoothly in any direction. Nothing to get out of order, and no mechanical knowledge required.

10,000 sold in past five years. Forty tons of paint applied by N. Y. C. Ry. to Buffalo stockyards by the SPRAMOTOR method. THEY KNOW! Write for 88 page free booklet to-day. Paint formula and all directions with machine.

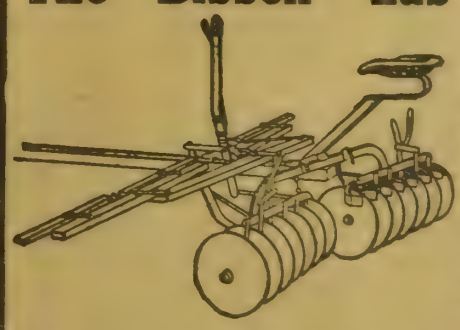
The "Bissell" has the capacity



Because of its capacity, time after time the "Bissell" Disk Harrow has done DOUBLE THE WORK in field competition against all competitors, under the same conditions.

The special shape of the "Bissell" plates cause them to enter the ground naturally and TURN THE SOIL EASILY. Steel scraper blades meet the Disk Plates chisel fashion and keep the plates clean of trash by movable clod irons—the only Harrow that has this feature.

Anti-friction balls (40) are used in the bearings, on every "Bissell" Disk.

The seat is placed back on the Harrow so that the weight of the driver when riding balances over the frame and REMOVES NECK WEIGHT. The hitch is well back, MAKING LIGHT DRAUGHT.

Search the Continent over and you will not find a Harrow with such cutting capacity, easy draught and correct proportions as the "Bissell." A postcard to Dept. M will bring you a free catalogue.

LIVE STOCK.

Warm Food for Pigs in Winter.

In a general way I am not impressed with the necessity or desirability of cooking food for the animals of the farm, either on the score of health or economy, but the pig in winter is an exception. He is decidedly a warmth-loving animal, and he always makes much greater progress in summer than during the colder months, although the food he gets then is generally inferior. All animals, and especially all young animals, thrive best in warm weather, but the pig is especially remarkable in this respect. Indeed, many breeders will not have young pigs about them in winter, not only on account of the tendency to rheumatism, but because they do not grow and thrive or pay for the extra food required for maintenance. Pigs in a state of nature supplement grass or herbage with roots of various kinds, for which they grub, beech nuts, acorns, &c., but domestication has accustomed the pig to a dietary consisting mainly of meals, or starchy foods like potatoes. With the improved breeds, bulky materials are as out of place as straw for a racehorse, and concentrated foodstuffs need to be employed. With this knowledge of the habits and needs of the animal to guide him, the pig-keeper, in his choice and preparation of food, should take care that the selection is such as will enable the animal to make the greatest possible progress in the shortest possible time.

In these days no other system of pork production is possible, and feeding, like farming, has to be intensive to be profitable. A healthy pig will eat almost anything that is put before him—he is literally omaivorous—but there can be little, if any, progress made if the food consumed has the effect of causing the animal to shiver for an hour after it has returned to its bed, or while it is being warmed up to the temperature of the body.

DANGER OF COLD FEEDING.

Dealing with the so-called "cramp" in pigs, Mr. Sanders Spencer ("Pigs: Breeds and Management") says:—"Then, if they are fed on a large quantity of cold slop, they are frequently seen to shake with cold, and return to the damp lair and huddle one on top of the other in the vain attempt to find warmth, and to warm up to natural heat the cold food with which they have filled themselves."

This is what commonly happens in cold weather, say, from December to March, if the pig's food consists of swill or wash and meal, the former taken from a tub or cistern exposed to the weather, and, therefore, at a very low temperature, or the meal mixed up into a thin paste with water that is little above freezing point. If these conditions are reversed and food given that has been cooked, or is warm, the pig may shiver as before, but this is a temporary chill from coming into contact with the colder air outside the sleeping place, and not on account of having swallowed a bellyful of cold swill.

COOKED FOOD.

No better proof of the benefits derived from the use of warm food can be adduced than the appearance of the animals themselves. In ordinary circumstances there is no great gain in cooking food, with the exception, perhaps, of potatoes, as most of the benefits derived from it can be obtained by heating the food with scalding water, but cooked food is generally warm food. The use of warm food for pigs is often objected to on the score of expense, and there is something in it, for time and fuel are important items. Economy in pig feeding is of great importance, because there is not a wide margin of profit under normal conditions of the pig trade, and pig feeders may well hesitate about going to the expense of boiling pig food, or boiling water to scald meals. In summer, when the temperature is high, cooking or scalding for pigs is quite unnecessary; but in cold weather the same quantity of meal gives better results when mixed with boiled mash, potatoes, or garden stuff, or prepared with boiling water, than if mixed with cold swill or colder water fresh from pump, well, or spring. There have been many practical experiments carried out on an extended scale, which confirm individual experience that the gain on warm faod is worth the expense.—Pateley Bridge in Farm and Home.

Sheep the Golden Hoof.

Editor Maritime Farmer:—

What a pleasure it affords me to sit down and write a few lines in favor of one of the greatest gifts of the Almighty to mankind. Bible history tells us that the raising of sheep was one of the earliest modes of business, for was not one of the first family a herder of sheep, and at that time wealth was counted by the number of sheep kept by them. And so it has been handed down to us from one generation unto another until we find ourselves still raising sheep, but by no means the numbers that we might be raising. What a wonderful wealth might be wandering in wooly members o'er these hills of ours, clad with such nutritious grasses as are prevalent in our Maritime Provinces and with a climatic condition favoring the production of the very best grade of wool to be found in our country. What reason have we then to offer against the production of more sheep and better ones? We have no more obstacles before us here than in any other part of the country—but best of all many, very many, advantages. One only needs to travel into the great sheep ranching States or Provinces of the west, and then you would wonder where or how the sheep found grazing in such large numbers, received their living. I am firmly of the opinion that the most of our Maritime farmers are not aware of the good fortune they possess, or of the possibilities that are before them. Let us then be up and doing. That there shall be a growing demand for good lamb there is no doubt. Very hard, severe winters followed by a long drouth has been the cause of 50,000 head of sheep a day being slumped onto the great Chicago market, and who can doubt but that there shall be a scarcity of lamb, for some time to come. Good prices are almost a certainty, but we must bear in mind to share in these good prices we must have the goods.

Then to the would-be sheepman let me say a few words. First in the selection of your flock, see to it that your choice lies in good strong ewes—well wooled—I mean by this that your sheep carry a good heavy fleece, of good quality and covering not being bare of wool on belly and legs. Then choose as to your form, in this case first of all do not look for sheep too nigh off the ground in other words—leggy ones—usually speaking they are hard feeders, therefore try to get them as low to the ground as possible.

Next, following the sheep from the head backwards; try to have as little neck as possible. Coming to the shoulder point have it open or broad on top with strong neck viens and directly behind the shoulder a strong heart girth; this is very essential as a weakness or depression here is what I consider to be a great fault, leaving as it does, lack of constitution.

Then coming to the back, have it straight, with well arched ribs, loin broad and full and hips wide and level and rump carried back as squarely as possible. The twist being deep and full and flank full and even with the underline. Then having chosen your flock of ewes, what about the sire for your next year's crop of lambs? This is by all means the most important issue to your building up of your grade flock. Kindly bear in mind the sire is half the flock. This being the case, you will readily see the value in securing a ram of number one quality. As to the breed, that is a matter of one's own judgment, some prefer one breed while another has his choice, but at any rate, see that you procure a pure bred sire and a good one. Now having selected your sire and your flock, look to your care or management of same.

Sheep do not need pampering nor great care as do other kinds of stock, but still care must be given them to prove of great success to the owner.

Let us direct our attention to the building which we will call our sheep barn or shed. See to it that there is first of all plenty of light penetrating into it and equally as much fresh air. This is very essential. Have the building well enclosed or boarded so that the sheep shall not be exposed to draughts in the cold fall and winter nights. Place inside your pen a serviceable feeding rack being so designed so as to shield the sheep from getting their fleeces full of foreign material that might lodge on them from the hay or fodder being fed.

Starting then in the fall of the year with your flock, be sure and have them dipped in any good reliable dip so that they shall enter the winter free of vermin and have the fleece in a good, healthy state.

See to it also that your ram is not over taxed at the mating season, and don't forget to try to get him a feed of oats and bran, mixed, say at least once a day, and when breeding season is over have him put into a pen and cared for away from the ewe flocks. It is very injurious to have the ram running at large with them during months of pregnancy. When feeding (the ram) is sometimes apt to knock the ewes and this has very often caused abortion. Through these months of pregnancy care must be taken of the ewe flock so that when the lambs arrive they shall be strong, healthy ones. At this time do not over feed with roots of any kind especially Swedish Turnips, but a few are grand feed, and these not more than once a day, a little grain, say once a day a mixture of one part wheat bran to two parts oats is good, and hay, clover if possible where alfalfa clover is fed no grain would be needed. But above all your feeding ration, see that your ewes have plenty of exercise. If they are not inclined to leave the barn, take your hay out a few rods in a sheltered place and so make them travel in and out, and in this way force them to exercise themselves.

And now we come to the most pleasant and interesting part of all—to the shepherd—that of the lambing time. What a welcome bleat is the cry of the first dropped lamb of the season. Now is the time for the shepherd to exercise all of his ability. Save as many of the lambs as possible and see that the little fellows never have a stunt in their growth.

It is an allwise thing when the young lamb, of masculine sex, is from ten to fifteen days of age, to have him castrated, and at the same age, to dock the tails of all. And now the lambs will be looking for a chance to eat. For this purpose I would advise a small enclosure or pen made at one corner of the ewe pen, with spars so that the little lambs could run through, and in a trough with some tempting rolled or crushed oats, wheat bran, and a few pulped roots, help themselves.

It is surprising indeed to see how quickly the lambs will take onto their feeding pen, and they will look for their feed as regularly as do the older ones.

Now is the time to keep watch on the lambs for ticks, which are sure to come off of the mothers, these can be made away with by the dipping process. But make haste and as soon as possible shear the ewes, and a few days afterward dip your lambs and you will in all probability have solved the tick question for a time.

When seeding time comes, don't forget a patch of rape for the lambs; this will be found a great help for summer or fall feeding. It was with great pleasure I read in your valuable columns of the step now being taken for the advancement of sheep in Newfoundland. May this be an object lesson to us, and may we all start fresh again and revive a fallen industry so much in need in our country, and where advantages for same are unexcelled anywhere. Only a little work and energy along this line, and, may I ask where shall our land values be at in a very few years hence?—Jas. A. Telfer, Markhamville, N. B.

INTERNATIONAL STOCK FOOD
is a splendid Pork Producer
The successful hog-raiser is the man who bends every effort to prevent disease and—KEEP HIS HOGS HEALTHY.
He provides his hogs with warm, clean quarters—and adds a little "INTERNATIONAL STOCK FOOD" to every feed.
This wonderful tonic keeps the blood pure—regulates the bowels—makes the animals eat well—and thus fortifies them against those banes of the breeder—Hog Cholera and Pneumonia.
3 FEEDS for ONE CENT
You can easily raise "Fall Pigs" and have them fine and fat for the market in May or June, if you feed "INTERNATIONAL STOCK FOOD."
Your sows will raise TWO GOOD LITTERS of strong healthy pigs EACH YEAR if you feed INTERNATIONAL STOCK FOOD. For fattening pigs for market, at the rate of 2 to 3 pounds extra a day, there is nothing in the world to compare with it.
The big hogs—prize winners, weighing from 500 to 600 pounds—are regularly fed "INTERNATIONAL STOCK FOOD." Why don't you feed it and make more money out of your hogs? 3 Feeds for one cent. For sale at all Dealers.
65
International Stock Food Co., Limited, Toronto

LAST CHANCE FOR FREE LAND.

A reservation of fertile valley land is now open in Mexico. Homesteads free. Only requirement is to have five acres of bananas planted within 5 years. An authorized company will plant the bananas and market them on shares. Your share should bring $200 per acre annually. The Janath Plantation Co., Block 2062, Pittsburg, Pa., U. S. A., distribute Mexican land in the U. S. and Canada. Write for particulars. You need not go to Mexico.

Digestion in the Calf.

In the juvenile ruminant, the abomasum, or true digestive stomach, popularly the "reed," or "rennet," so called because it secretes the rennin or milk-curdling ferment, whose action is necessary to clot the casein of milk, is by far the largest pouch of the gastric mass. Fluids, like milk or substitute gruels with skimmed milk, are carried directly into it, and there meet the secretions most concerned in their digestion, so that there is no great use for the other pouches or compartments which later in life play such an important part in the function of digestion or preparation of the food for assimilation for the purposes of nutrition. This is why the young calf cannot deal properly with hay or other bulky food, and also why bringing it on to bulky or solid material should be a gradual process. In a state of nature, where the cow and the calf run together on the grass, the calf begins very early in its life to pick about with its mother. It takes a little grass and a great deal of milk, but by progressive stages, during which the rumen or "maw" is gradually developed, this proportion is changed, and the first stomach eventually overshadows the fourth in the matter of capacity to an even greater degree than at birth the fourth exceeds the first. This explains why the young ruminant cannot extract sufficient nutriment from hay, and why the mature bovine cannot exist in a healthy, thriving condition on slops, although for some time life may be maintained on it.

Keeping Aborting Cows.

Many a valuable cow has been disposed of at the price of a canner for the simple reason that she has aborted. To substantiate this statement I wish to call attention to the case of a cow that has long held the world's record in her breed. This cow was bought out of a stock yard by one who knew a good cow regardless of her history and surroundings.

The mere fact that a canner may be developed into a champion butter producer ought to satisfy the average person that wonderful work can be accomplished with cows if they receive the proper care and attention. For this reason, do not dispose of cows because they have aborted, or have had misfortunes that make it seem easier to dispose of them as canners than to give them a little special care and attention and develop them into healthy, profitable animals.

Disposing of a cow that has aborted does not necessarily free the herd from exposure. Invariably a cow that has aborted retains the afterbirth. This is often permitted to rot or slough away. The animal is then rendered a hotbed of disease.

If such an animal is not fit to live, why should it be fit to die and be consumed by human beings. Unless a cow is advanced in years, it will pay the owner handsomely to give her a little special care and attention and restore her to her normal health and condition. This can be done at a much less expense, compared with the loss brought about in disposing of her as a canner.

Fails to Breed.

T. A. M., P. E. I., has a six-year-old cow that does not get with calf, although she has been bred to three different bulls. Failure to breed is due to many causes, such as too high flesh and feed, diseased ovaries and uterus, abnormal uterine secretions and adhesions about the mouth of the uterus caused by injury, perhaps at last calf. Give low feed and a dose of a pound of epsom salts a few days before coming in heat, and just before service the hand should be introduced and the mouth of the uterus opened. If this treatment fails I should be inclined to think that there is some local disease.

The Home of True Economy

J. 815—Women's charming waist of finest quality sheer white Persian lawn. Front finished with hand-embroidered panel, in a very pretty floral design, rows of French Valenciennes lace, insertion and tucking; tucked collar; sleeves ¾ length, edged with lace. Positively phenomenal value. Sizes 32 to 44. Price, all charges paid $1.08

THE HORSE.

Horses do Best When Supplied with Different Foods.

A common fault in feeding horses is the lack of variety of feed. With the large number of different grains and feed stuffs available, it does seem that every team owner should provide for his animals a ration that would be perfectly acceptable. It is a fact, however, that not more than 20 per cent. of the horsemen of the country feed a well balanced ration, and, adds the American Agricultural from which paper this article is reprinted, the other 80 per cent. still cling to the old rations of corn and hay, or oats and hay, which practical experiments have long since proved to be expensive and wasteful.

Think of your own appetite, when it comes to feeding of horses. Suppose you are performing hard, manual labor. How long would you be content to eat two articles of food, the same thing for every meal, day after day? It is quite safe to say you would tire of your ration in a very short time. It would be like eating a quail a day for 30 days, and your digestion would soon get out of order.

CAUSE OF IMPERFECT DIGESTION.

A bad digestion and a poorly nourished body is always the result of improperly balanced food. When such a condition exists in either man or horse, the best physical effort cannot be expected. It is impossible. No one or two articles of feed will give your horses all the elements of nutrition their system needs. If you want the best results, feed a ration that contains all the elements of nutrition in properly balanced proportions. Every stockman realizes that corn alone is not a well balanced grain for feeding. Neither is oats, or barley. Of the three grains, oats is probably fed more extensively than corn or barley combined. The latter grain is rapidly gaining favor as feed, however, and when properly combined with the other grains, makes an ideal ration.

The necessity for grinding a part of the ration cannot be too strongly emphasized. The horse owner who fails to do this loses 25 to 30 per cent. of its nutritive value. The hard outer covering of the grain makes it difficult to assimilate and a very large proportion passes through the stomach of the animal in an undigested condition. An examination will show the whole grain and prove the truth of this statement.

ADVANTAGES OF GRINDING.

A ground ration is ready for quick digestion. Your animals utilize it more readily and there is practically no waste. It should be remembered that the horse digests its food quickly and whatever ration you feed should be prepared with a view to supplying the nutrition the horse needs. Horses will work better and keep in better condition on five or six quarts of ground mixed feed than they will on a considerably larger amount of whole grain. Feed a variety of grains properly balanced and have them well ground and you will not only have better horses, but it will cost you less money to obtain this much desired result.

Horse Shoeing.

True economy does not consist in refraining from spending money; to withold repairs at a critical time, for example, may save a labour bill, but it may mean the entire destruction of a building, and that would be a very expensive "economy." So it is with the feet of the horse, unless they are kept in a proper healthy condition the horse becomes practically valueless, for "no foot, no horse" is an axiom the truth of which is very plain. Reasonable expense in the care of the feet is, therefore, the truest of economy. One of the extravagances which country people especially are guilty of, is in allowing the shoes to remain on too long.

HEAVY SHOES.

With this end in view, they insist on the use of shoes that are unnecessarily heavy,—indeed, many seem to hold the opinion, though they would not perhaps admit it, that the best farrier is he whose shoes will wear the longest. It ought not to need saying that if a horse, every time he lifts a foot, has to raise a shoe which is needlessly heavy, a strain is put upon him for which there is no return, and to a certain extent his working powers are lessened. A well-known veterinary authority, Sir F. Fitzwygram, says that he has known very large cart horses burdened with shoes which weighed as much as 7 lb. each. This means an enormous weight of iron to lift if the movements in a day's work are calculated, and in so far as it is unnecessary it is not only unduly wearying to the horse but is a loss to the owner. It is not possible to give any exact weight to adopt for the shoe, for the wear in the case of different horses varies greatly, and much depends on where the work is done. Horses travelling over stone sets, for example, would wear their shoes much more quickly than animals working on the land. Two horses working together may have different requirements as their "action" is different, and it must not be forgotten that the feet themselves vary in character, animals bred in an upland district having generally much stronger feet than those bred in the fens or in other low-lying moist places. But it may be taken as a general rule that no horse should be fitted with a shoe that will last more than a month or five weeks, and that the shoe should be replaced as nearly as possible every month.

THE FOOT A LIVING STRUCTURE.

The foot is not a mere block of horn to which iron is nailed for its preservation when travelling over hard surfaces, but a living structure, continually growing, shedding off parts that are worn out and replacing them with new material; and if the shoe is allowed to remain on too long the horse will suffer and his capacity for work will be impaired, while the foot itself may be permanently damaged. It is, therefore, not in any sense economical to keep the shoes on as long as they will last, and if they are to be discarded as quickly as they should be it is a waste of iron and of the horse's strength to make them too heavy. The owner should study the require-

Horsemen Attention!

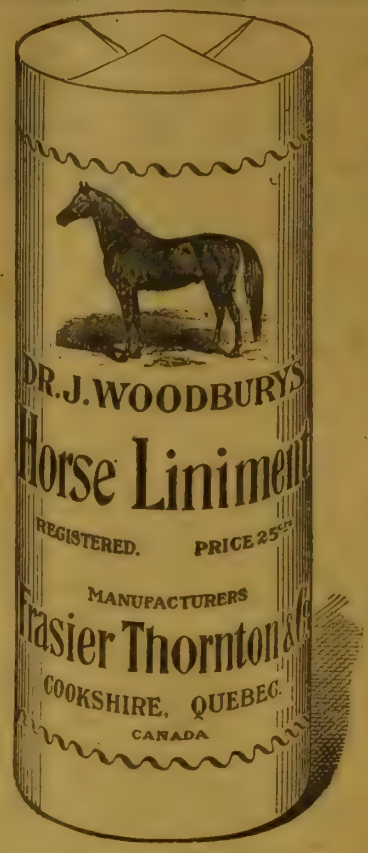
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

Demand

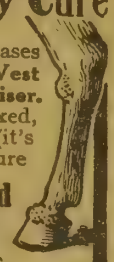
DR. J. Woodbury's Horse Liniment

AFTER USING

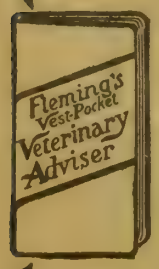
Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

How to Completely Cure

nearly 100 farm stock diseases is told in **Fleming's Vest Pocket Veterinary Adviser.** Write us for this indexed, illustrated 96 page book (it's free) and learn how to cure



Spavin and Ringbone



Soft blemishes like Bog Spavin yield to **Fleming's Spavin Cure (Liquid).** Bony blemishes are cured by **Fleming's Spavin and Ringbone Paste.**

FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S GALL CURE,** a soothing, healing salve, the old time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. Bickmore's Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel, etc.** You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trademark on every box. None genuine without it. Look for it when you go to buy and do not take a substitute. Farm account book is ready. No obligation. Send today.

ments of each of his animals and give him just what shoes are suited to him, if he desires to let the horse work in comfort and do the utmost of which he is capable.

But there is a fashion in shoeing as in most other things, and the treatment of the horse's foot is dictated by fashion, sometimes to an extraordinary degree. Who is not acquainted with the paring out of the sole and the trimming of the frog, and the rasping of the crust, that take place in the farrier's shop, and for which it is to be feared it is not the farrier so much as the owner who is responsible! The owner has his own views, and will have them carried out, if not by this farrier then by that. It would sometimes seem that the object is to make the foot to fit the shoe rather that the shoe to fit the foot, but the underlying reason of the paring and rasping is to make a "neat" foot—to finish it off nicely, so that it may look symmetrical and blocky. The desire for neatness is commendable, but a nice appearance is dearly purchased if the horse is damaged in the process.

What is it that keeps the horn of the foot in its elastic and pliable condition? It is the amount of water that it contains, and it may surprise many a horseman to know that the amount ranges from 25 per cent. in the horn of the crust to 43 per cent. in that of the frog—that is to say, nearly half of the latter is water! Let horn be exposed to sun and air and it quickly becomes so dry and brittle that it can easily be reduced to powder, but if it is soaked in water it remains tough, yet pliable, and is not easily broken. Nature provides the foot with a varnish for the special purpose of keeping the horn moist, and all the parts of the foot have some provision for the same purpose. Now, in rasping the smith takes off this varnish and leaves the horn exposed to the action of the atmosphere, with the result that it quickly dries and deteriorates, and we have all sorts of troubles arising as a consequence.

EVILS FOLLOWING MUTILATION.

Among these evils may, for example, be mentioned sand-crack, which is frequently traceable to this foolish practice of rasping the crust, though it may be due to other causes also. This may cause great lameness and pain, and if it progresses far, so as to expose the sensitive laminae; and it is a troublesome complaint, because split horn cannot unite, and repair can be brought about only by growth, which takes time, during which the services of the horse are lost to the owner. That very painful disease known as laminitis, or founder, may be brought about by the rasping of the crust and the paring of the sole and frog, because of the effect these practices have on the horn. The disease is directly caused by concussion, and when the horn is damaged the sensitive parts are naturally exposed to harder blows than they would get were the foot sound.

These are illustrations of the results of the mistaken practices indulged in by owners and smiths, either in response to the dictates of fashion or because of prejudice. But they do not stop here, for often the paring of the sole and trimming up of the frog are carried on to a much greater extent. Some horsemen will have the sole pared away until it "springs" when pressed by the thumb—a most mischievous thing to do. In order to enable this to be done they make use of filthy stoppings such as cow-dung to soften the horn. Or when this has not been done in preparation, sometimes a shovelful of hot ashes is poured into the hollow of the foot before the removal of the shoe, and allowed to remain long enough to soften the horn and render paring easy. But the sole needs no paring at all, because the fibres break off in flakes when they have attained a certain length, and this constant succession of flakes serves a purpose in keeping the other layers in a moist and supple condition.

THE FROG.

It is similar with the frog, which is sliced away for appearance' sake. Notice the high calks to be seen on the feet of many cart horses. It would seem that many drivers of heavy horses have the idea that something dreadful will happen if the frog comes on the ground, but that is exactly what nature intends it to do, and if the feet have been kept in a healthy condition from the start, the frog will be in a condition to carry on its natural work. It is curious that horsemen will first of all have their animals rasped and cut, and afterwards will apply a "dressing" to keep the feet moist—that is, they first destroy nature's own provision, and then go to trouble and expense to provide something else, for the same purpose, that is not nearly so good!

If we contrast the feet of a horse who has been shod in the conventional fashion for a long time, with those of a colt who has not yet been burdened with shoes, we shall see that the frogs of the former are weak, shrivelled and thrushy, while those of the latter are full, healthy and fleshy. Those of the horse cannot stand pressure, while the colt's are uninjured by work even on hard ground. In dealing with horses not spoilt, let the crust or wall be lowered sufficiently to allow the frog to come to the ground, but never permit the smith to use the knife on the frog or sole, or to rasp the wall above the clinches.

HOT SHOES.

Damage is often done by fitting shoes on too hot. This injures the parts near to those burnt away, and the practice ought to be prevented. We do not mean the practice of fitting hot shoes, but the use of excessive heat in order to burn away portions to make the foot fit the shoe. This we are assured is sometimes the result of "cutting" prices, and it is well to pay a good smith a fair price for doing his work properly. If prices are reduced unduly it is rarely the purchaser who benefits in the long run. In this case the smith lightens his own labour to compensate for the smaller price, but the owner, although he may not realise the fact, is the loser because his horse is injured.—Farmyard Series.

How Do YOU Spread Manure

THE above illustration shows the difference in crops, between the I H C way of spreading manure—and the pitchfork method.

The pitchfork way is slow, hard, and disagreeable, wastes much of the value of the manure, and the results hardly justify the labor and time invested.

The I H C Spreader cuts the manure into fine shreds, spreads it evenly, and makes the work easy. Spreading manure the I H C way is bound to result in better soil, bigger crops, and more profits.

I H C Manure Spreaders

Corn King—Cloverleaf

are simple, strong, and durable. They have many advantages that make them superior to other spreaders.

All working parts are extremely simple and wonderfully strong. The beater driving gear is held in a single casting, so that there is no binding—no cutting of parts caused by the gears springing out of alignment. The roller-bearing support for the apron reduces the draft. The levers are convenient. The feed changing device can be shifted quickly and easily. The wide range of adjustment allows you to spread manure heavy, medium, or light, as your judgment tells you is best for the soil.

Whether you have a large or small farm, or want a spreader for orchard use or truck gardening—there is an I H C that will suit your requirements. Why not see the I H C local agent at once? Get a catalogue from him, or, write nearest branch house.

POULTRY.

When the Amateur Becomes an Exhibitor.

To the amateur who has decided to show his birds the question where he shall make his first exhibit is an important one. He is to be congratulated upon arriving at the decision to become an exhibitor. If he desires to establish a reputation as a breeder of high-grade Standard-bred poultry, it is essential that he show his birds in competition. If it is his intention to breed them for his own satisfaction, exhibiting in competition with others adds zest to his pleasure.

Different motives impel the amateur to place his birds in competition with others. Perhaps he bought eggs or stock at a medium price from some breeder who claimed to have pure-bred stock and he believes that his birds are just as good as those of his neighbor who bought high-priced stock and eggs from some well-known breeder of high-class stock. They look much alike to him, though amateur No. 2 naturally thinks that his birds are far superior. Amateurs usually are pretty certain of the superior excellence of their own birds. Did he not buy good breeding stock or eggs? Were not the chicks that hatched lively and did they not grow fast and are they not the picture of good health and vigor? The proud owner sees nothing but their good points, perhaps through ignorance, overlooking serious defects or even a disqualification. Some think that the good points ought to outweigh even the latter.

Before deciding definitely where to make his first exhibit, the amateur should study that part of the Standard of Perfection that applies to his particular breed or variety. He should also look up tne general disqualifications and then earnestly endeavor to select those birds that come nearest the Standard requirements in every section or the ones that average best. If possible he should call in some experienced breeder, an exhibitor or judge, some one who is familiar with his breed or variety and who knows about how strong the competition is likely to be. His advice should be valuable.

Occasionally an amateur makes his first exhibit at one of the largest shows and meets with success, but we do not advise amateurs to try the big shows first, for there are several things (we might call them tricks, of the trade) that enter into the winning of a blue ribbon at a large show that the amateur can learn only by observation and experience.

THE FALL FAIR POULTRY SHOW.

Perhaps the safest course for the amateur who thinks he has good stock, is to send for a good poultry judge and get his opinion. If this is not practical, then take the birds to some fall show. The poultry shows at our county fairs these days afford good competition and poultry judges of ability are now being employed to place the awards where formerly the judging was done by Tom, Dick or Harry. As a rule, amateurs have very few ideas in regard to properly conditioning their birds and his first exhibit is likely to teach him a great deal. He will learn from older exhibitors many things in regard to preparing his birds so as to bring out their best points.

Of course we always meet the fellow who has "just as good at home," but when finally he puts his birds in competition with others he learns that tne judge discovers many defects that he never saw. The trouble is that most breeders, especially beginners, can see nothing but the good points of their fowls. They watch them grow from shell to maturity and some one bird or some good point stands out so prominently that it overshadows the defects in the eye of the owner, but the judge looks for defects.

Let us not call the fall fair a poultry exhibition. Let us consider it rather as a school of instruction. Suppose the amateur following our advice takes his birds to a fall fair and gets the opinion of the judge and good breeders in regard to them. He is then in a position to select his fowls for his real exhibit, which generally follows the fall fair within a month or two, and the knowledge that he has gained is well worth all the expense to which he has gone. As the largest shows are held generally in December and January, the amateur will have plenty of time to "try out" his birds at some of the smaller shows in November. While it is a fact that birds are at their best just once and it is not advisable to exhibit fowls too often, still the amateur must consider his first show or two as a school wherein he is to learn how to win the ribbons. Therefore, we advise the amateur to select some good show to be held in November that is not too far from home. When one wins all he can, the money barely pays expenses and as expenses are an important item with the majority of exhibitors, it is well to show first at no great distance from home, nevertheless he should seek a show that will have good birds in competition, for that is where he will learn the most and where the honors count if he should win. The poultry journals publish lists of shows that are to be held, with dates and judges and all shows are advertised more or less locally. When he decides where he would like to show, write to the secretary and ask for catalogue and entry blanks, doing so as early as possible. Study the rules printed in the catalogue very carefully so that the entry may be properly made.

A proper understanding of the rules governing the show at which he is to exhibit will save the amateur trouble in the show room. At a majority of the smaller (score card) shows an exhibitor's pen entry is generally selected by taking his four highest-scoring females and his highest scoring male. In such cases he should select his fowls for their individual merit and thus have on exhibition his nighest scoring individuals

If the amateur decides to enter birds in a comparison show where a pen entry consists of four females and one male that do not compete in the single classes, then he must decide whether he prefers to win in the single classes or to win a pen prize. It takes a large string of good birds to win in both the single and pen classes at such shows and the ordinary amateur would not have enough good birds. The first prize pen is considered the best prize to win and first prize cockerel the next. The reason for this is that the first prize pen shows that the breeder has fowls that are well matched, while the first prize cockerel shows that he can produce good stock (and the male being half the pen has the preference), hence in selecting a pen for exhibition look first for uniformity of type and size and then select birds that are as uniform as possible in color. A well balanced pen is what we want. They may all be a little too dark or a little too light in color, a trifle small or large in size, but if they are well balanced they will stand a much better show of winning than if they are uneven in type, size or color.

Be careful in making entries that the leg band numbers are properly listed. See that the fowls entered for pen competition have the proper numbers grouped and are marked "pen entry." It is well to put a brace in front of them as many pen prizes have been lost through birds getting mixed. This is especially true when the exhibitor cannot accompany his birds to see that they are cooped right. Keep a duplicate list of leg band numbers and a record of how each was entered so that you may have something to which to refer in case tne original is lost or delayed in the mails. Be sure to select your birds and make your entries in plenty of time as it saves the secretary a great deal of time and work and avoids confusion.

COOPING AND SHIPPING BIRDS.

The distance, the weather and the fowls must all be considered when cooping and shipping. The coops should be light in weight in order to save express charges, but they must be strong enough to withstand the rough handling given them by the express messengers and draymen. Many exhibitors ship in cloth-covered exhibition coops without knowing that they have to pay double express charges on that style of coop. If you contemplate shipping in such a coop, nail lath on all sides so that the birds cannot escape should the cloth be torn. By doing this you will also get a cheaper express rate, but you probably will have to call the express agent's attention to the fact that you are using something more than a cloth-covered coop in order to get the rate. If the association furnishes the exhibition coops, then it is advisable to ship in a light-weignt, wooden coop.

Have plenty of ventilation as too often shipping coops are piled on top of each other and the birds are smothered. At the same time protect the birds from drafts and dirt by covering the openings with muslin. After the coops are ready, see that the shipping tags are made out according to directions given in the show catalogue. Put in good, clean bedding and see that the inside of the coops is wiped off so that the plumage of the fowls will not get dirty by rubbing.

Before shipping the birds give them a feed of raw onion as it will help to ward off colds. If the birds are well up to Standard weight we would not feed very much of anything except onion, but if they are a little underweight give them a good feed of boiled rice or cracked corn, or both, and put some whole corn in the shipping coop. If they are under-weight and are being sent to a score card show, it is well to mark on the coop tag, "Be sure to feed before weighing."—R. P. J.

Turkeys.

In selecting breeding stock for a market turkey ranch the most important point of all will be to secure good strong healthy birds, not akin, and from stock that has not been in-bred in the past, as in-bred stock is a source of disappointment and failure. It is strange that this habit of inbreeding is persisted in when the disastrous results are so well known. It will pay to mate hens of local stock with pure bred bronze, wild or

INVINCIBLE
INVINCIBLE FENCING
Canadian Made • Canadian Quality
Why should Canadians buy fences made from imported Bessemer "close-wiped" galvanized wire with the thinnest possible coating? Wire "skimped" to swell the sellers' dividends. Witness the rusty dilapidated fences everywhere. Canada for years has been a dumping ground, and fence-factories are still turning this "skimped," imported Bessemer wire into fencing which will come very dear to the user.
The interests of The Steel Company of Canada and those of the Canadian farmer are mutual. On the permanent good will and welfare of the Canadian consumer the Steel Company of Canada places the highest value. Invincible Fencing, made of the finest steel heavily galvanized, and woven by men of long experience, merits the Trade of Canadian Farmers.
It is Canadian made and Canadian quality. Of the finest open hearth steel and honest, heavy galvanizing. The Invincible lock has the grip and tenacity of the British Bulldog.
Invincible Hot Galvanized Gates are a wonderful improvement. They are zinc-clad, rust-proof and indestructible, good for a lifetime, yet cost about the same.
Agents should get promptly in line with the biggest Canadian steel producing company and the most desirable and paying line in the Dominion. Write for agency proposition.
THE STEEL COMPANY OF CANADA, LIMITED
THE FENCE DEPARTMENT, BOX 31. MONTREAL, CANADA.

They Keep the whole system in the pink of condition.

Their singular curative properties discovered by an Indian tribe—introduced to civilization nearly a century ago—compounded since 1857 in the Comstock Laboratories at Brockville, Ontario.

Dr. Morse's Indian Root Pills

have a remarkable record for consistently curing constipation, biliousness and indigestion, purifying the blood, banishing headaches and clearing the skin. 25c. a box everywhere.

28

semi-wild toms even though the cost may seem a little high. It must be remembered that the male is half of the flock, so to speak, and no reasonable expense should be spared to prevent inbreeding.

At the present time the bronze turkey takes the lead and is more popular than all other breeds combined. It meets the requirements of the market, makes a rapid growth, is hardy and a good forager. For the reason that they are so generally bred it is not difficult to secure good breeding stock at a slight advance over the market price and one should be able to buy good hens in the fall of that season's hatching, selected from a large flock, for $2.50 to $3 and gobblers of the same age at $4 to $6 each. Older birds which would be more desirable would cost a trifle higher, however, first class breeding stock, suitable for starting a market turkey ranch could be obtained from $4 to $6 for hens and $6 to $10 for gobblers.

The standard weight of the bronze turkey is 12 to 18 pounds for hens and 20 to 30 for gobblers, according to age and condition. Select turkeys with large frames snugly built, heavy turkeys, owing to excessive fat are not desirable. A hen two years old in good breeding condition weighing from 12 to 14 pounds and toms, the same age, weighing from 25 to 30 pounds will be considered good weight but large stout vigorous hens should be the aim of the breeder.

If inconvenient to secure all the breeding stock two years of age, buy at least part of the flock that have been through one breeding season and the balance from the ealiest poults of the year. In selecting breeding stock it would be best to buy of some reliable breeder who is making a success of the turkey business, whose stock has free range and as far as known have no trouble with disease. Better pay a little more for the right kind of stock to start with.

The breeding stock should be purchased before January in order to become acquainted with their new quarters before the breeding season. In buying this stock it would be best when possible to buy from a place of the same kind of climate as that in which they are to be kept. To ship turkeys from a hot climate to a cold one means a chance of loss and the same when shipping birds from a cold part af the country to a very hot one.

When the breeding stock arrives, place them in the stockade and keep them in until they become accustomed to their new quarters, go among them and feed them what they will eat readily, feed often at first, spend as much time in the stockade as can be spared in order to tame the birds.

After a week or ten days try them out of the enclosure by opening the doors just before it is time for them to go to roost allowing an hour or more to look around outside the enclosure. It is quite important that the birds are watched at this time and see that they all return, for once beginning to roost outside they will give endless trouble. If they are slow about coming in at night toll them with a little grain. The following day the birds may be let out earlier in the afternoon and in this way they will soon become acquainted and may be given their freedom for the entire day.

Having started with good stock it will be an easy matter to improve and build up the future breeding stock by selecting the most promising young birds from the hens having a good record as breeders, this is where the record card will come in very handy. Always keep the best and earliest hatched birds of the flock for future breeders, marketing those with poor records. After a flock has been built up that will produce hens weighing from 9 to 11 pounds and gobblers from 12 to 15 pounds at Thanksgiving time then it will be well to begin looking after the fancy end of the business for selling breeding stock at an advance over the market quotations.

To get the top price for breeding stock they would have to meet competition in the show room. This will cost more than the awards amount to in dollars and cents but not so as an advertisement. All noted poultry breeders who are securing fancy prices for their stock and hatching eggs won honors in the show room.

In breeding for the fancy end of the business health and vigor should not be sacrificed for fine feathers. Gradually by selecting from a large flock, birds that will be proficient for market and show room may be secured. In breeding pure stock a copy of the American Standard of Excellence and two or three good poultry journals will be of great assistance.

During the mating season the proper proportion to divide the sex would be from 7 to 10 hens with one gobbler although it is often the case that successful hatches have been obtained when a much larger number of females have been allowed with one male. Better be on the safe side and have enough males so there will be no doubt of the fertility of the eggs.—Successful Farming.

LUMBERSOLE BOOTS

Our Lumbersole Boots are made of fine Grain Kip uppers, lined with thick brown felt about 1-4 inch thick, as the name suggests the soles are made of specially selected wood which resists the water, and keeps feet warm.

All Sizes $1.75

For Farmers, Drivers, Fishermen, Builders, Sailors and all outdoor workmen they are worth four times the price.

How "Eastlake" Steel Shingles will save you money

Talk No. 5

Exclusive Features

By

The Philosopher of Metal Town

Mr. Farmer, I suppose you know of the big experimental farm at Guelph, Ontario.

Here, the farm buildings have "Eastlake" roofs.

Some of these buildings were roofed 18 years ago—all are in perfect condition to-day.

A pretty stiff durability test, don't you think?

It's the "Eastlake" exclusive features that count.

The single side-lock and gutter, the "Eastlake" counter-sunk cleat and the three-inch lap.

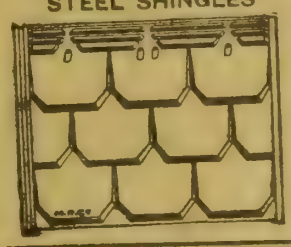
The "Eastlake" single side-lock makes it the easiest and quickest to lay and permanently weathertight.

No rain or snow, no matter how fine, can sift in under an **"Eastlake" Steel Shingle.** There is a full three-inch lap and the counter-sunk cleat holds the bottom of the shingle as tight as though welded in place.

The bold "Eastlake" Pattern is so deeply embossed that only the very best material will hold it.

Let us send you our illustrated booklet, **"Eastlake Metallic Shingles."** Write to-day—just your name and address on a post-card.

"EASTLAKE" STEEL SHINGLES



We also manufacture Corrugated Iron, House and Barn Siding, Metallic Ceilings, Eavetrough, Conductor Pipe, Ventilators, etc.

The Metallic Roofing Co.
LIMITED

Toronto - Winnipeg

FREE TO YOU—MY SISTER FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, your sister. I want to tell you how to cure yourselves at home without the help of a doctor. No one cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhoea or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 2 cents a week, or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhoea, Green Sickness and Painful or Irregular Menstruation in young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all women's troubles and makes them well, strong, plump and robust. Just send me your address, and the free 10 days' treatment is yours, also the book. Write to-day as you may not see this offer again. Address

MRS. M. SUMMERS, BOX H 309 - - WINDSOR, ONT.

Be sure to address your Correspondence to the Maritime Farmer's new home, Clarence St. St. John.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Down at Uncle Bill's.

I want to go to Uncle Bill's,
Where I can have some fun;
Where all the folks ain't findin' fault
With everything that's done;
Where hired girls don't try to keep
Things so all-fined neat,
An' yell when I come up the steps:
"You, Johnny, clean yer feet!"

I want to go to Uncle Bill's,
Wnere folks don't stick their nose
Up in the air becuz I wear
My very oldest clo'es;
Where I can haul my stockin's off
An' go barefoot all day,
An' wade out in the duck pond, er
Turn han' springs on the hay.

I want to go to Uncle Bill's,
They's sumthin' there to do.
I sit up readin' Injun books
As long as I want to.
I ride the horses to the barn,
An' help to milk the cow,
An' go down in the lot to watch
The hired man 'at plows.

I want to go to Uncle Bill's,
I don't have no fun here!
They keep me too all-fired clean,
An' call me "Johnny dear,"
They're allers watchin' out fer words
I hadn't orter speak,
An' make me wash my face and han's
A million times a week.

I want to go to Uncle Bill's,
Where I kin get enough
Of puddin', doughnuts, pie an' cake,
An' all that kind o' stuff.
Where I ain't told I mustn't call
Fer but one piece, but where
They tell me to keep eatin', long
As anything is there.

I want to go to Uncle Bill's,
That's jest the place for me.
They 'se allers sumthin' there to do,
An' sumthin' there to see.
I go in swimmin' when I please,
An' climb around the hills—
O, you can bet the place for fun
Is down to Uncle Bill's!

Love's Barrier.

(Continued from last issue).

CHAPTER XVII.

HIS OWN WIFE.

Helen's lips instantly smiled.

"Why, yes, of course; there is nothing I should like better. I am very fond of Audrey, Mrs. Hayes."

"It is because I know you are that I came to-day. I am seriously concerned about the child's future, and really, Mr. Hayes is so unpractical about everything outside the works that I have simply no one to consult with."

"But what is the matter with Audrey? I am sure she is perfectly happy. She comes in here like a singing bird or a bit of sunshine. She looks well, too, the picture of health. What is there to trouble about?"

"Well, you see, Audrey is nineteen, and she has never been properly brought out. And she is very like her father in his unpractical ways. She's a perfect Socialist in some things. As I said to her father this morning, she would much rather entertain the Girls' Club to tea than meet decent society. And I'm so afraid she may get into any undesirable entanglement."

"But Audrey is not at all that kind of girl, Mrs. Hayes," said Helen perplexedly. She simply never thinks about men, for I suppose it is men you mean."

"Yes, of course, there could not be an entanglement of any other kind that would seriously matter. Audrey is not a flirt, certainly, and in some things she is ridiculously young; but she's impressionable, too. Let me tell you.

"There is a young man at the works called John Ridd, of whom my husband thinks very highly. He has just told me that he may be a partner some day. He is considerably older than Audrey, and, unfortunately, when we were away last summer, he happened to be spending his holiday at Scarborough, and, invited by Mr. Hayes, he came about with us a good deal. Audrey was allowed to go out a good deal alone with him. I was not at all well—the sea did not suit my gout—and I had to be indoors a good deal. And I must say I thought a sober-minded sort of elderly young man like John Ridd was perfectly safe. There is no doubt he fell in love with her. No, of course, he did not say anything to her—he would not have dared, I fancy, without speaking to her father first—but he managed to make an impression on her. She says she likes him better than any man in the world except her father and Mr. Secretan."

Helen smiled.

"And what does Mr. Hayes think about it? Audrey has never mentioned John Ridd's name to me, so I don't think his image can be very deeply engraven on her heart. She talks to me about most things."

"I thought she did, and that's why I've made bold to ask your advice and help with Audrey. You see how it is with us here," said Mrs. Hayes plaintively. "We have not really the kind of society we ought to have, the kind of families into which I should like to see Audrey married. You'll admit, won't you, that she would grace any station?"

"Yes, certainly she would; but she is very young. Let the child have her youth. She will never be as happy again in the world as she is now."

Helen spoke with a kind of quiet passion, which would have impressed a less frivolous and selfish woman than Mrs. Hayes. But she, passing by that warning note, hastened on to the business in hand.

"Audrey ought to have her chance. I had a very good mind to speak to the Duchess at the garden-party last week, but she was kept so busy with her guests, I didn't have a chance. But she has always seemed interested in Audrey, and she has met her here a good deal."

"She thinks her a sweet child, as everyone does. Let her be as she is as long as possible, Mrs. Hayes," pleaded Helen. "There are so few like her, we can't afford to have her spoiled."

"But she needn't be changed in any way, though she were to have more chances. What I should like would be to see her presented at Court next spring, and come really out in London."

"Well, that would not be so very difficult, surely. So many people go now, don't they?" said Helen vaguely.

"Yes, I suppose they do; but, living so quietly as we do up here on these moors, and Mr. Hayes being so void of ambitions of that kind, I am simply blocked. I mean I can't do it unless I have somebody to help me. I thought I could rely on you, dear Mrs. Secretan."

"But I am nobody," said Helen quickly. "I should be abjectly useless."

"But you have been to Court, haven't you?"

"Yes, about ten years ago, in a borrowed frock one of my cousins lent me. I was frightfully bored, and I never was so cold in the whole of my life, I think, as when waiting in a hired carriage in the Mall in a March snowstorm."

"These are small things when weighed against the distinction of being received by the Queen. Where do you think I could get anybody to present Audrey?"

"Wouldn't Lady Durham do it? She's the wife of the lord lieutenant, isn't she? And Mr. Hayes is an influential man in the county."

"She wouldn't; she has snubbed me. Lady Durham is not at all a kindly person from whom one could ask the smallest favour," said Mrs. Hayes eagerly, willing to confess something in her desire to win her way with Helen. "What I should like. and I wonder whether it would be too much to ask, is if you would interest the Duchess in the matter, and—and, perhaps, some day when it would be quite convenient for herself, she might be so good as to present Audrey."

Helen's eyes became round with amazement.

"The Duchess has not been to Court for over twenty years, not since she became a widow, I am certain."

"But she would always have the entry, and I am sure she would do it if you asked her."

Helen snook her head.

"I could mention it to her, but I am as certain as I sit here she would refuse."

"Dear Mrs. Secretan, if only you would mention it, I have great faith in your powers of persuasion; and of course, you are very intimate aren't you?"

"Yes, I suppose we are. But now she is leaving Mardocks, and nobody knows when she will come back—that is not going to be of much use to any of us."

"But she must have a wide circle, she might use her influence," said Mrs. Hayes eagerly, pressing the matter beyond the limits of courtesy. Unless she had been wilfully blind, she must have seen that Helen was now listening with reluctance and evident dislike.

"I'm afraid I can't do much," she said finally. "If I get a chance before the Duchess leaves, I can just mention it to her, but frankly I don't think it is the smallest use. She belongs to the very old school, and I have often heard her declaim at the present elasticity of Court etiquette. I don't think she would care to go any more."

"Ah, but one never knows; and if you will just bear the dear child in mind I shall be for ever grateful. Well, as you are alone to-night, won't you come back with me and dine; then you will see John Ridd. It will not be formal; I shall not even wear a low dress."

"Thank you, but it is impossible Mrs. Hayes. My husband will be home by the late train, I expect, and I should not like him to find me out of the house."

"What a devoted wife you are!" said Mrs. Hayes admiringly. "But don't spoil the Rector. The best of them are easily spoiled. Well, I must go. We are going to Marienbad next month. At least, Mr. Hayes has consented to my taking a foreign cure. I am looking forward to enjoying it, and it will be good for Audrey, too. I understand Marienbad is very full and very fashionable in August."

"I have never been there," answered Helen; "but I dare say you will meet all sorts and conditions of people."

Helen laughed in the depths of her old prie-dieu, after the scheming mother had left the house. She was so transparent in her scheming that a child could see through her. Presently, however, Helen's thoughts flowed into more dear and intimate channels, and she owned to herself how empty the house was without her husband. He had not been gone more than thirty-six hours, and she knew herself counting the hours till his return. Her face even flushed a little, and her eyes became luminous, as she admitted it to herself. Should she tell him, she wondered? Some day soon the veil must be lifted. The love which was growing up in her heart—a strong and gracious power—must soon assert itself. Sometimes she caught herself wishing that his reserve and self-control were less admirable. He had kept his promise to her in the spirit and in the letter, and she knew that he waited for the first advance to come from her. She was in no haste. She was living now in a delectable land of hope and promise, and could wait for fulfilment.

Sometimes Jane, who loved her so well, watching the sweet face in the Rectory pew, discerned there a new tenderness, a something that robbed

AFTER DOCTORS FAILED

Lydia E. Pinkham's Vegetable Compound Cured Her.

Midgie Station, N. B.—One can hardly believe this as it is not natural, but it was my case. For ten months I suffered from suppression. I had

different doctors, tried different medicines, but none helped me. My friends told me I would go into a decline. One day a lady friend told me what your medicine had done for her, so I wrote you for advice and received your reply with pleasure.

I started taking Lydia E. Pinkham's Vegetable Compound, and at the second bottle showed improvement. Now I am regular and never was so well in my life, thanks to Mrs. Pinkham's medicine.

Please publish my letter for the benefit of others.—MRS. JOSIAH W. HICKS, Midgie Station, N. B.

Indian Head, Sask.—Lydia E. Pinkham's Vegetable Compound is indeed a boon to women who suffer from female ills. My health is better now than it has been in my five years of married life and I thank you for the good your advice and medicine have done me. I had spent hundreds of dollars on doctors without receiving any benefit.—MRS. FRANK COOPER, Box 448, Indian Head, Saskatchewan.

The most successful remedy in this country for the cure of all forms of female complaints is Lydia E. Pinkham's Vegetable Compound.

We are grateful that our efforts to do good work are appreciated, and are striving to not only maintain but to increase our reputation.

Catalogues to any address.

S. KERR, Principal.

Here is a message of hope and good cheer from Mrs. C. J. Martin, Boone Mill, Va., who is the mother of eighteen children. Mrs. Martin was cured of stomach trouble and constipation by Chamberlain's Tablets after five years of suffering, and now recommends these tablets to the public. Sold by all dealers.

every feature of the hardness which had marred it when she came first to Midcar. And she kept on praying, first, that God would reveal Himself to Helen's soul, and that through the miracle of Divine love she might begin to understand the human. Jane was not a very great or learned woman, but she was wise with the wisdom which can create the joy of life.

She saw, without making the smallest remark, that the power of the religious life was beginning to be exercised over Helen, and that she took pleasure in what had formerly been a duty. Secretan had been very careful not to press the advantage he had gained, and, professing himself to be grateful for the concession she had made, forebore to advance any claim for personal consideration. These weeks had not been without their lesson for Secretan also. All his life the spirit of selfishness had been paramount, and oddly fostered by his immediate environment; now he had to think continually of the comfort and convenience, even of the caprice, of another. He became more patient, more tolerant, more considerate in every relation of his life. His naturally quick temper often flamed yet, but the flame did not disturb Helen's equanimity. It was a generous temper, always ready to make amends, and without a trace of vindictiveness in its composition. Very gradually these two so strangely wed were being led by a way they knew not towards a more perfect understanding. But the realization of a thousand lovely hopes was not to be accomplished without a descent into the deeps of human anguish.

The late train arrived at Midcar station at ten minutes to nine o'clock. When Secretan stepped off it, and his keen eyes swept the platform, without, however, any expectation of seeing his wife there, Helen stepped forward from the doorway of a cheerfully lighted waiting-room and touched his arm as he was about to stride into the booking-office.

"Here I am, dear! I had been in the house—at least, in the garden—most of the day. I thought I would like a walk."

Therewas a certain shyness in her speech which was exquisite. She had to apologise for her disposition to offer him a wifely welcome.

His face flushed, he passed over his ticket, and drew her hand through his arm.

"Thank you very much. It's the first time you've met me, Helen, of your own accord, isn't it?"

"Oh, don't say that! Well, and are you very tired? How is old Colchester looking, and how did you find Cynthia?"

"Colchester looks charming, and so, I must say, does Mrs. Revell. She sent you her love.

"Was she very much surprised to see you?"

"She did not say, and we discussed the business quite amicably. She wishes to sell the house. She thinks it too big for her."

"But I don't want to sell it, Claude. It could be let quite as profitably. Besides, I know exactly what will happen if she gets the responsibility of the house off her shoulder. These poor children won't have a home anywhere. Don't you see, the house is a sort of anchor for her to keep her from wandering on the Continent and elsewhere?"

"I see your point perfectly, but I don't really think she will be kept from wandering in her present mood. She is thoroughly disgusted with Colchester and all its ways."

"That's because she has put herself outside the pale, in a sense. People don't like her; she has never cultivated the best people, and now the others have got tired of her. Was anything arranged, then?"

"When I got there I found that Mrs. Revell had practically made her

own plans. She has let the house furnished for August and September, and is going to Marienbad or Wiesbaden or some other of the health resorts."

"And the children?"

"She was to send them to Margate with Betty, the nurse girl. You will remember Betty—she asked almost tearfully for you."

"I remember Betty perfectly, of course. She was the general drudge. So the poor things are to go to Margate with Betty! You see what an irresponsible creature Cynthia is. She simply doesn't see that these wretched children spell duty for her."

"I must admit she takes them very casually. Well, as I couldn't bear the idea of them going like that, and they asked so—so affectionately for you, I proposed that Mrs. Revell should send them here for the two months the house is let."

"You did, Claude, without ever consulting me!" she cried, with a little gasp.

"I thought it the right thing to do," he answered quite calmly. After all, they are your father's children, and, besides, they are dear little things; they only want a little guiding. You don't mind, do you?"

"You take my breath away. I'm not sure whether I mind or not. Geoffrey and Margot trapesing over my pretty house, and trampling down my rose-beds! Did she agree, then?"

"Yes; they will be here next Monday, by this very train."

"Why, Claude, you are very masterful. How did you dare to make such an arrangement without consulting me?"

"I thought it the best one in the circumstances. They can run wild on the moor, and when you tire of them you can send them up to Jane. There isn't anything else we can do about the house in the meantime. Perhaps we could both go down to Colchester after Mrs. Revell returns, and try to arrive at some definite arrangement about things. If she can find a purchaser, she is determined to sell. One can see that. And in Colchester, apparently, there is a good demand for houses."

'Yes, of course, there are not enough to go round; but I don't want the house sold. I shall hold out against it as long as I can."

"The matter isn't urgent in the meantime, at least, and that urgent letter of Mrs. Revell's didn't mean anything. You need not have alarmed yourself about it. I felt quite sorry for her. Perhaps if she had had some wiser friends to advise her, she would have been a different woman."

Helen stole a side glance at him, and perceived that Cynthia had not woven her spell in vain. To pose as a misunderstood and unappreciated creature had become an art with her. A slightly qitter smile destroyed for an instant the sweetness of Helen's mouth. Once more she derided in her soul the lack of perspicacity in man. As Ann Coyne truly said, they were all babies from start to finish.

"Now tell me what you have been

about all day?" said Secretan tenderly.

"Presently; I haven't done with Cynthia yet. Did she say anything about me?"

"Why, yes. She spent a good deal of time talking about you."

"But that was unnecessary. You should not have allowed her to go on. She would not say anything kind about me."

"On the contrary, she was all kindness, and I really believe that she misses you. I asked her to come here when she returned to England, and take the children back with her, and she seemed quite grateful for the suggestion."

"Claude, how could you—how dared you? You don't know Cynthia. She would be quite capable of coming here, and, if she happened to feel pretty comfortable, would think nothing of settling down for the winter with us."

Secretan's laugh rolled out on the fragrant dark of the midsummer night.

"I think we might be able to shift her before she attached herself like a limpet to our rock. Let's dismiss Cynthia. I want to know what you've been about since I've been away."

"Yesterday I was most of the day at Mardocks, helping the Duchess to pack. To-day I have been in the garden up till tea-time, when the deluge descended in the shape of Mrs. Hayes bursting with a new project that Audrey shall be presented next spring by the Duchess."

"Good for Madame Hayes! She came to enlist your good offices, I suppose?"

"Yes; and while I did not altogether nip her in the bud, I explained that her ambition was unlikely to be realised—at least, as far as the Duchess is concerned. She is afraid lest Audrey makes an undesirable matrimonial venture. It seems there is one John Ridd."

"I have met John Ridd at High Ridges, a very fine fellow, but certainly, from her mother's point of view, Audrey might do better."

They crossed slantwise through the village, and arrived without further speech at the Rectory gate. It looked so sweet and homelike in the moonlight that Secretan's heart swelled within him with a quickened sense of gratitude.

"A man never knows the true inwardness and dearness of his home till he has seen other places that are homeless," he said in a sudden full tone which stirred Helen's heart. Her hand trembled on his arm. She made a little sudden movement which he did not understand. They came presently to the open door, and lingered a moment on the step. The moonlight lell full on Helen's face, and Secretan's eyes scanning her every feature, he was thrilled once more by its beauty. There was an expression there which he had not seen before, and made him put an anxious question.

"You are not tired, are you, darling?" he asked, with a sudden passionate tenderness. "It was very sweet to see you to be at the station, but I did not expect it, and it was not even necessary."

"Perhaps I thought it was," she said wistfully; then suddenly, without a moment's warning, she turned and threw herself upon his breast.

Secretan's arms closed upon her, and his face bent inquiringly to hers, his breath came quick and fast. There in the soft midsummer moonlight, on the threshold of their own home, was their real betrothal. Love had stolen unawares, and secretly, into Helen's heart, and now, sweeping everything before it, would have its own.

Home Made Candies.

By patience and a little practice you can make a perfect cream candy. Then you have a splendid foundation for any cream you may wish to make. One thing we must always remember, never to cook our sugar in an old or black pan. Always use a bright, new pan.

Place four cups of white sugar and one cup of water into a bright pan on the fire and boil ten minutes without stirring. Test it by dropping some from the spoon, and if it threads remove the pan from the fire. Take out a small spoonful, and rub it against the sides of a bowl; if it becomes creamy, and you can roll it into a ball between the fingers, it is properly cooked. If it will not cream let it cook two or three minutes longer, being careful not to leave it on the fire too long. When it will cream and roll into a ball, pour the whole into a bowl; when cool enough to bear your finger in it, beat it with a large spoon; it will soon look like cream, and as it grows stiffer work it like bread dough. Add flavoring as soon as it begins to cool. It can be packed in plates and cut into fancy shapes, or it can be made into rolls and sliced off; if the cream gets too cold in the working you can warm it. Here are several points to be remembered: If the sugar looks rough when it is cool enough to beat it is because it has been boiled too much or has been stirred. After it is beaten if it looks sandy or sugary instead of looking like lard or cream it is the result of not being cool enough before beating. It should harden and work like dough, if it does not it has not been boiled enough. If this is the condition you can put it back into the pan with an ounce of hot water and cook it a few minutes. When turned into a bowl to cool it should look clear as jelly.

Fruit creams are made by adding raisins, figs or any fruit chopped and added to the cream while it is quite warm.

English walnut creams are very nice and very easily made. Form the foundation cream into a ball, place one-half of each nut upon each side of the ball, pressing them into the ball.

Vitality gives you the manly courage to protect those depending upon you, as portrayed in the picture. No matter what thoughtless action or early indiscretion may have sapped your strength, vitality restores it to you. It makes you over into a strong, vital, manly man, without an ache, pain or weakness. Vitality puts the real VIGOR OF YOUTH into your blood; no matter how nervous or debilitated you may be, it puts the sunshine of vigorous manhood into your life; I make you feel young and keep you feeling young, without the use of drugs, without the necessity of dieting, without one bit of change in your present mode of living, except, of course, dissipation must cease. Just lead a manly life and use my HEALTH BELT; every thing else will come. My HEALTH BELT, worn at night, pours a great, soft stream of VITAL STRENGTH into your blood, nerves and organs during all the hours you sleep; in one night it takes the kink, pain or weakness out of your back, ere long friends will be saying: "How well you look," and you are answering: "Never felt better in my life!" Your eyes will sparkle with health; you will have that pleasing influence to fascinate and control which comes to all full-blooded, strong, vital, manly men. Thousands upon thousands are now using my Health Belt all over the world. With special attachments it cures rheumatism, kidney, bladder, stomach disorders, etc.

Let Me Send You This Book Free....

Here is my latest illustrated book: "Health In Nature," containing a fund of private information relating to weakness of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely no obligation on your part to purchase. I simply want you tc read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.

Dear Sirs—Please forward me your book as advertised free.

NAME ....

ADDRESS ....

Chocolate Creams—Melt one cake of chocolate and keep it hot. Have small cone shaped balls formed of the foundation cream; take the balls on the tines of a fork, pour the melted chocolate over them with a teaspoon, and when well covered slip them from the fork upon the oiled paper.

Cocoanut Creams.—For one cocoanut ream c take two tablespoons of grated cocoanut and half as much foundation cream; work them with your hand till the cocoanut is well mixed in. Add a drop of vanilla.

If the cream is too soft to work into balls, you can stiffen it with confectioners' sugar. These can be dipped into melted chocolate if desired.

Colored Creams.—Make the foundation cream receipt and divide into three parts; leaving one part white, coloring one part pink with fruit coloring, and one part brown with chocolate. Make the white cream into a flat ball, lay on a buttered dish and pat it out flat until it is half an inch

thick; work the pink in the same way and lay it upon the white, then the chocolate and lay upon the pink, pressing them together. Trim the edges off smooth then cut into slices. Work this up as rapidly as possible.

When the Child is Sick.

The child's illness is the mother's opportunity. There is nothing that can so crystallize the love of home as the memory of some childish illness when mother knew just what to do. Men and women brought up under the old, stern regime remember gratefully the season of illness as the time when they were allowed to have a fire in their bedrooms—a luxury at other times unattainable. Nowadays we surround our children with comforts unknown to former generations, but the little illnesses of childhood have not ceased to be times of special privileges, special care, special tenderness.

To a child, the mere fact of being in the house all day, of the foods prescribed as a special diet, of the unaccustomed quiet of the room are features of a drama. But there is danger in this thought that mothers do not always realize. Children are adults in the making, and we all like to feel ourselves important. The delight of being the central figure on the stage, the object of attention from everybody in the house, may, to a child of egotistic temperament so conquer the pain and discomfort of the illness that a morbid, hysterical after-effect will be left. The child should have every possible care and attention, every demonstration of affection—that goes without saying—but it should not be made to feel that an invalid by right rules the house. We have all known nervous, exacting women who make slaves of their families, and drain the family purse and patience, to minister to some ailment that is half fancy. We have all known men who will indulge themselves in some favorite dish, though they know perfectly well what will happen if they do. That sort of thing is not infrequently begun in childhood by the injudicious coddling of mothers, aunts, and grandmothers. It does the child no good to hover about the bed, asking every five minutes, "How do you feel now, darling?" and discussing symptoms with all the neighbors who happen in. If the child is healthy-minded it will be bored by the whole performance, and, if not, it will rather enjoy it and play up to it, which is much worse.

IMPRESSIVE LESSONS.

Another lesson that should be taught in the illness of a child is absolute obedience to the doctor's orders. The habit of this may actually save life. In the hospitals, the doctors speak of certain people who are "good patients," meaning that by intelligent docility they are co-operating with the doctor's efforts to cure. It makes all the difference in the world, in some illnesses, whether the patient is working with the physician or against him and the wilful, capricious invalid who will not obey orders, who has never learned self-control, who makes the most of every symptom, is simply "doing his best possible" to prolong the illness. Habit is everything in such a case. The child can learn that there is a right way and a wrong way even of being ill, taking medicine, etc.

The easiest way to bring about this self-discipline is through the imagination. The small boy knows that soldiers in hospitals show their saldierly qualities quite as well as they do when in battle. There are many good hospital stories in the old war annals. If the boy can dramatize his sprained ankle or his attack of fever as part of the fortunes of war he will be making a hero of himself in the right way. Girls, too, often feel the thrill of such stories as quickly as boys. Tell the children of the heroism shown when great cities have been besieged; give them the stories of the Indian Mutiny, Florence Nightingale, Mother Bickerdyke, and Clara Barton. The advantage of taking the heroic side of illness for one's theme is that it does not tend to prolong the illness, and it is to be feared that some of the old tales of patient and saintlike child-invalids might.

DIET IN SICKNESS.

The diet of the child is naturally dependent on the orders of the doctor for that particular illness. But the food should always be served in a dainty way. A fastidious child will often be absolutely unable to touch food served in a sloppy, unappetizing fashion. One can always have a few odd and pretty bits of china, and fringed napkins, and tiny glasses, for just this emergency. Not only do such trifles help to create the memory-picture, but they are part of the home training every child should have, and when the little girl, grown to be a woman, has other invalids to care for, she will have learned how to do it right. Little glasses or cups for fruit-juice, broth served in one's special silver cup, toast on a plate with the quaint nursery-rhyme picture in the middle—things like this go a long way with a child.

Too much pains should not be taken when convalescence begins to "keep the child amused." It is better for all invalids to take a rest cure than to be stimulated. Some trouble should be taken, however, to make little changes in the room from day to day. It is easy to put up different pictures now and then, to change the growing plant in the window, to shift the position of the bed and give a difference view. Here, again, one can save up for such an emergeocy. When stray magazines have lovely colored frontispieces or covers, save them when the magazine is thrown away, and keep the pictures in a box out of sight. Have two or three frames of a size to fit the different pictures—one large enough to take in a large picture, the others of the right size for the usual magazine frontispiece. These pictures may be hung on the bedroom wall and from time to time changed when the child is asleep, and in case of contagious illness, they can be destroyed when their use is over. Even a better plan is to hang them from the screen which every sick-room should have, to fold around the bed and shut off drafts or light. An easy way to make such a screen is to tack soft-colored cambric on a folding clothesrack. When the child is well enough to read, little verses and pictures can be pasted on one side of the screen, one or two being added each day.

A large box of scrap pictures is most convenient in providing amusement for the child's convalescence; so are paper dolls, tin soldiers and puzzle pictures of a simple kind.

Among the special comforts of illness may be counted sand-bags to keep small chilly toes warm. Make a round bag eight or 10 inches across, fill it laosely with good dry sand and sew it up. Then make a cover in the shape of a hunched-up rabbit or a cat out of flannel or eiderdown. Such a sand-bag will heat on the top of a radiator or in a moderate oven, and if you have two for each cover, can be changed in a moment, while the child's fancy will be taken with the quaint iittle bunny or pussy. In Japan the earthen hot-water bottle is made in the form of a curled-up kitten and is called "neko" (kitty).

For a very little child one of the blankets with borders of animals will afford amusement, but for an older one try a geography coverlet. It takes some time to make, but when made it will last indefinitely and older children used to map-drawing can do it. Use for the upper side of such a coverlet pale blue cotton, and draw on it a large map—a map of the world if you like. Then, either go over its outlines with black embroidery cotton or cut out the continents, islands, etc., in colored cambrics and applique them on, drawing the rivers, cities, and mountain ranges in indelible ink. The outlines need not be absolutely accurate or very detailed, of course. The material used should be washable. Then, with the tiny china figures that one can buy for two or three cents at any shop where they sell favors, there will be chance for all sorts of travel-plays. A favor-shop is an excellent place to pick up toys for small invalids for next to nothing. Water-flowers, rice-paper pictures, tiny paper animals and birds, and all sorts of trifles are sold there, and have the advantage of weighing nothing in the languid little fingers which are to handle them.

But the main point in providing amusements and accessories for a child's illness is that they should be kept for such a time. The ability to provide a seemingly inexhaustible store of new playthings in an emergency is one of the faculties which make a child feel that mother knows everything.—L. Lamprey.

After 22 Years

Quaker Oats has become the world's breakfast.
It now outsells all other brands combined.

And this is the reason:

For this brand we pick just the rich, plump grains. We get but ten poundsof Quaker Oats from a bushel.

Then these grains are prepared in a way which retains all their exquisite flavor.

The result is oatmeal at its best — the most delightful oat food in existence.

And it costs but one-half cent per dish.

Quaker Oats

The Quaker Oats Company

PETERBOROUGH, ONT.

Trade Mark on Quaker oats are on every package.

Every Farmer Keeps House

and he uses every sort of housekeeping convenience used by his city cousin. Moreover, he generally owns his house and so equips it permanently. He can and does buy better grades of merchandise for this very reason. When he buys a piece of furniture there is no thought of buying cheap "because it may not fit in the next flat."

When he buys a stove, he does not want one that will do for a year or two only "because the next house may have one installed," or have no room for a range of good size.

He wants a stove that will last him for years and which will not keep him sending to town everyfew months for repairs. He wants one that is modern and up-to-date—and yet a reliable range, not a faddy one. In short, he wants an—

ENTERPRISE MONARCH STEEL RANGE

because he has the makers' guarantee that it will do the work required of it and stand the wear and tear of daily use in a farm kitchen.

If you keep house you need a MONARCH in your business. Send for circular.

A Talk to Farmers' Wives.

As I sit and watch the first snowflakes of the season dancing around the buildings and scudding along the pavement, my mind travels back to the many times when from the window of a little farmhouse on the prairie I watched the first snowflakes and thought of the long winter before me, just as many of you are doing to-day.

As I look back to life on the farm I feel like one who, from a distance, watches a game, and feels that he can tell the players what to do; so, because I am outside of the game, I can perhaps warn you, who are in the thick of the struggle, of a few dangers that are threatening.

First, I would like to tell you how happy you should be in your life of quietness and plenty, but I suppose you will not believe me any more than we believed our parents when they told us our school days were the happiest in life. But note that I said your lives should be very happy, not that they are, because in too many cases the greed for gain is making slaves of our farmers and their families.

We teach our children that the days of idols are passed; that we no longer offer sacrifices, but they will soon learn from life that we still worship idols, and our offering now is always a human sacrifice. Students every year are offering themselves on the altar of ambition; business men are following the glimmer of gold, regardless of all the other and higher joys of life; professional men are lured on by the most subtle of all temptations—fame—to give themselves body and soul; while too often the farmer offers himself and his family to satisfy an insatiable desire for cattle and horses and land.

Just here, it seems to me, comes in the tragedy of life on the farm. It is always possible to get men to garner the harvest, but there is no one to help the farmer's wife, cook and care for the extra harvest hands, and prepare for threshing. Then, too, at this time of year, pickling and preserving must be done, and the fall sewing is always demanding time. How one pair of hands can do so much I cannot say; in fact, it has always been a mystery to me, but do it they often do, and very well at that. Of course, they have to work long after the rest of the family are sound asleep, and they have to begin again before the others are up, but they get it done.

You wonder why the husband and father will allow the mother of his children and the woman he has solemnly promised to love and protect to commit suicide, and never raise a hand in protest. It is chiefly because he does not think. When they first started out in life together, they were very anxious to succeed, and both did all they could. Then a child came to the home. The mother was not strong, but she persisted in doing without help, regardless of the fact that she was ruining her physical frame. The husband at first protested, but men are very human, and he soon became accustomed to her doing all the work, and expected it of her. She made superhuman efforts, and congratulated herself that she was saving a girl's wages, never thinking that she was violating one of Nature's most stringent laws, and that she would in time pay the penalty; never thinking that she was wronging ner husband, her child, and her children yet unborn; never thinking that in time to come her children might blame her needless and wicked abuse of herself for their lives of torture and blighted hopes. You are paying too dearly for your farms, my friends. Your worldly possessions will but mock you when you come to face the great and inevitable fate of mankind—death.

I am not prepared to offer a solution of the servant girl problem for the west, but it has frequently occurred to me that if farmers advertised as diligently for help for their wives as they do for help for themselves, that the demand would not greatly exceed the supply. I would like to suggest, however, that you lighten your burden this fall by engaging a girl to do your fall sewing. If you have never had one, you will be surprised at the great relief you will feel to have all the sewing for the winter done. In all the districts in which I have lived sewing girls can be engaged at from seventy-five cents to a dollar and a half a day, and it is surprising how much they can do in a couple of weeks if they are reasonably smart.

It will be money well spent, for it is eternally true that "The hand that rocks the cradle is the hand that rocks the world," and we do not want a nation nurtured by white slaves, weak in body and mind, but by women, strong in body and intellect, and able to bequeath to their children that which is above the price of cattle and horses and land.—Belle MacDonald in Hearth and Home.

How to be Happy.

Many of us miss the joys that might be ours by keeping our eyes fixed on those of other people. No one can enjoy his own opportunities for happiness while he is envious of another's. We lose a great deal of the joy of living by not cheerfully accepting the small pleasures that come to us every day, instead of longing and wishing for what belongs to others. We do not take any pleasure in our own modest horse and carriage, because we long for the automobile or victoria that someone else owns. The edge is taken off the enjoyment of our own little home because we are watching the palatial residence of our neighbor. We can get no satisfaction out of a trolley ride into the country or a sail on a river steamer, because someone else can enjoy the luxury of his own carriage or yacht. Life has its full measure of happiness for every one of us, if we would only make up our minds to make the very most out of every opportunity that comes our way, instead of longing for the things that come our neighbor's way.

This Was No Joke.

The other day over in the town of G—, Ontario, Mrs. R. came into Mr. B's store and asked for a couple of packages of Dye. He was selling the Old Style Dyes that require a Separate Dye for Wool and Cotton, and asked her if she knew what kind of cloth her goods were made of. Mrs. R. said she wasn't sure, so he advised her to go home and make the following test:—

"First to take a small piece of the goods, and ravel out the threads each way of the Cloth, then put a match to them. Cotton would be apt to burn freely with little odor, Wool might merely singe and would be apt to give out a disagreeable odor, something like burning hair. Silk would burn less freely than Cotton and smell like burning Wool. Now, if it did not smell very much, she was to use a Dye for Cotton, if it did she was to use a Wool Dye, but she was to look out to see that it did not smell too much or too little.

Now, unfortunately, Mrs. R. had a cold in her head at the time, and couldn't smell anything, so she naturally thought that the goods were Cotton, and used the Cotton Dye. It turned out that her goods were really all Wool, and naturally her Dyeing was a failure. Since then B. has put in an assortment of the Guaranteed One Dye for All Kinds of Cloth, which does away with all chance of using the Wrong Dye for the Goods one has to color.

Mrs. R. is naturally much relieved as well as B's other Lady Customers.

First Aid to Busy Farmers

THE farmer's champion helper is an I H C Gasoline Engine. On thousands of farms throughout the country, they are kept busy every day, running the cream separator, churn, pump, feed grinder and cutter, fanning mill, thresher, wood saw, grindstone, washing machine, dynamo for electric light plant, and many other machines. They are saving work, time, and money at every turn of the wheel.

I H C Gasoline Engines

are built for hard, steady work and years of it. They are simple, dependable, economical. They are always ready to save and make money for you.

An I H C For You

The size and style I H C engine you need depends on the work you have for it to do—and on the particular conditions which surround your locality. Any size or style will not do. You must get the right engine to get the right service.

All I H C gasoline engines are marvels of strength, reliability, and durability. They run smoothly, year in and year out. They make and save money every time they are used, and whatever style and size engine you want is in the I H C line, which includes: Vertical type—2, 3, 25, and 35-horse power; horizontal—1 to 50-horse power; semi-portable—1 to 8-horse power, portable—1 to 25-horse power; traction—12 to 45-horse power; sawing, pumping, spraying, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write direct today for our new catalogue.

I H C Service Bureau

The purpose of this bureau is to furnish farmers with information on better farming. If you have any worthy questions concerning soils, crops, pests, fertilizers, etc., write to the I H C Bureau and learn what our experts and others have found out concerning those subjects.

Sermons Boiled Down.

Charity requires no other letter of introduction than a real need.

Always it is better to get a man to thinking than to give him thoughts.

The secret of consecration is simply concentration on some high service.

An analysis of the water of life will do little to relieve this thirsty world.

Many a word in our language is empty until sorrow gives it a new content.

Debating doctrine is an old dodge of the devil to avoid the doing of some duty.

You cannot make a text of scripture bore any deeper by twisting it like a corkscrew.

Whatever strengthens class feeling lengthens the day of waiting for the kingdom.

He who limits his knowledge by his understanding dies of experimental ignorance.

The more a man vociferates against vice the less likely he is to put virtue into action.

Some folks never get any dreams of heaven except when they go to hear a sleepy preacher.—Chicago Tribune.

QUICK RESULTS.

Laurie M. Anderson, Sackville, N. B., in sending in a new advertisement to the Maritime Farmer, writes: "The last ad. I had in the Maritime Farmer sold the bull I offered, at once."

Slow Witted.

When persons aim at me their wit
I give them dart for dart;
I do not show them that I'm hit
But play a Spartan part.
Unscathed they make of me no sport,
As I can firmly state,
For I'm most clever with retort—
About an hour too late.

Ah, yes, I think of answers when
The foe has gone away;
The acid things that strike me then
Are sharp enough to slay.
But readiness is not my forte;
It is my doleful fate
To be most clever with retort
About an hour too late.
—Baltimore American.

Good Advice.

Senator Ingalls tried sarcasm in public life, and it failed. He had an exceptional gift for making enemies, and they ultimately retired him to private life. Once an intimate friend wrote asking his influence in favor of a friend desiring a public appointment. To this letter the Senator returned a very sarcastic answer, and received the following reply:—"My Dear Senator,—I think it would be well for you to reserve your sarcasm for the rapidly increasing number of your enemies, instead of offering it to the decreasing number of your friends of whom I am one." It is said Mr. Ingalls never forgot the rebuke, but it was too late.—New York Tribune.

Tact Lacked.

Miss Clara Clemens, Mark Twain's daughter, was talking at Atlantic City about entertaining.

"Tact," said she, "is essential to good entertaining. I once dined at a house where the hostess had no tact. Opposite me sat a modest, quiet man. This man suddenly turned as red as a lobster and fell into a horrible fit of confusion on hearing his hostess say to her husband:

" 'How inattentive you are, Joe. You must look after Mr. Blank better. He's helping himself to everything.' "

Wanted a Hearing.

"Are you the editor that takes in the society news?" enquired the caller, an undersized man with a timid, appealing look on his face.

"Yes, sir," replied the young man at the desk. "I can take in any kind of news. What have you?"

"Why, it's this way," said the caller, lowering his voice. "My wife gave a swell party last night and I'm willing to pay to have this report of the affair put in your paper."

"We don't charge anything for publishing society affairs," observed the young man at the desk, taking the proffered manuscript and looking it over.

"That's all right," was the reply. "You don't understand. I wrote this up myself and I put in a line or two that says, 'Mr. Halfstick assisted his distinguished wife in receiving the guests.' That's the way I want it to go, and I don't care if it costs a sovereign a line. I want my friends to know, by George, that I still belong to the family!"—Tit-Bits.

"I sent you some suggestions telling you how to make your paper more interesting. Have you carried out any of my ideas?'-

Editor—Did you meet the office boy with the waste basket as you came up the stairs?" "Yes?" "Well he was carrying out your ideas!"—Woman's Home Companion.

Knowledge is power, and so is a gasolene-engine. Both must be used to get the most out of them.

Both A
Bread Flour
And A
Pastry Flour

"A woman always wants a reason, but never gives one".

So we are going to tell you just why **"Beaver" Flour** is a bread flour and a pastry flour —as good for one as for the other—*and best for both.*

Ontario Fall Wheat is the most nutritious wheat in the world — rich in flesh and strength building qualities and with a full rich flavor and splendid pastry making qualities.

Manitoba Spring Wheat has more strength than Ontario Fall Wheat—but is not so good for pastry.

Naturally, *the perfect flour* is the one that combines the good qualities of *both* Ontario and Manitoba wheat. *This is exactly what* **"Beaver" Flour** *does.* It is a *blend* of Ontario Fall Wheat and Western Spring Wheat. It contains *exact quantities of each.* **"Beaver" Flour** has the real home made flavor that a Western Wheat flour lacks—it makes deliciously light, tasty Cakes, Pies and Fancy Pastry.

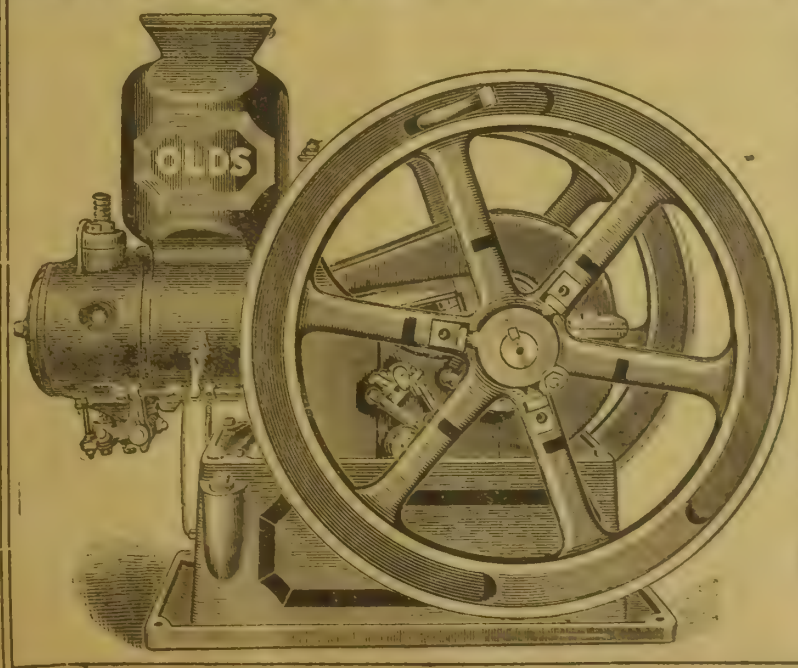
135

Order "Beaver" Flour

for your next baking day. Put it to the test. Try it for *both* Bread and Pastry—and see for yourself the convenience and economy of using a true blended Flour. Dealers—Write us for prices on Feed, Coarse Grains and Cereals.

THE T. H. TAYLOR CO., LIMITED, - CHATHAM, Ont.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

CAUGHT HEAVY COLD.

Left Throat and Lungs Very Sore.

There is no better cure for a cough or cold than Dr. Wood's Norway Pine Syrup.

It is rich in the lung-healing virtues of the Norway pine tree, and is a pleasant, safe and effectual medicine that may be confidentially relied upon as a specific for Coughs, Colds, Bronchitis, Hoarseness, Sore Throat, Quinsy, and all Throat and Lung Troubles.

Mr. S. Monaghan, Charlottetown, P.E.I., writes:—"I certify that Dr. Wood's Norway Pine Syrup is an excellent medicine for coughs and colds. Last winter I contracted a heavy cold which left my lungs and throat very sore. I had to give up work and stay in the house for two weeks. I used several cough mixtures, but got no relief until a friend advised me to use Dr. Wood's Norway Pine Syrup. Three bottles entirely cured me, and I can recommend it as the best medicine for coughs."

Don't be imposed upon by taking anything but "Dr. Wood's" as there are many imitations of this sterling remedy on the market.

"Dr. Wood's" is put up in a yellow wrapper; three pine trees the trade mark; price 25 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

FLORICULTURE.

O. M. of St. John, writes:—I have a large Hyderangea plant that was given to me last Easter. I was told to put it in the cellar during the winter. I have done so but now it has sprouted until the leaves are showing. They are lookiog yellow and sickly. What shall I do with the plant? It is in a very small pot. Should it be repotted? Do these plants require much water at this time of the year? It took a great deal of water last summer.

The Hyderangea should be brought to the light but should not be placed in direct sunlight for a fortnight. It may be repotted in a large pot, say two sizes larger, only be sure and press the soil firmly about the old ball of roots. Water thoroughly; you will find that the plant will not require nearly as much as last summer. After the buds form it will be helped by using manure water twice a week.

E. L. I., St. John, writes:—I have a large Sellegenella. It is about two feet across in a pan about twelve inches in diameter and six inches deep. It has grown finely and is a large plant but the pan is a mass of roots and there does not seem to be any earth in it, in fact the plant seems to live on water of which it takes a large amount daily. The centre of tne plant is beginning to turn brown. It certainly seems to need repotting but I do not know what to put it in or haw to do it.

This plant evidently requires repotting badly, otherwise the brown would not have appeared in the centre. You will have ta get an unglazed pan or pot, about six inches wider and about two or three inches deeper; be sure that at least six drainage holes are made in the pan. Draw the top of the plant together with a newspaper so that it will be out of the way and repot as you would any other plant. Be sure that the soil is kept wet after repotting, you will find that less water will do than was needed before.

A. M., Chatham, writes:—Is it wrong to put more than one bulb in a pot, I have been told it was not right? I like a lot of blooms on a pot.

It is certainly better to have a single plant or bulb of Callia in a pot. A single plant is quite capable of filling a large size pan with roots in a comparatively short time and will take about all the water you can give it.

Be sure and watch your Hyacinth bulbs. If the green tops are beginning to show, bring them up to the light and water.

H. A., St. John, writes'—What can I do to prevent the bugs and wood ticks from eating the sprouts of the bulbs kept in our cellar? They have ruined some White Narcissus and are eating holes in the Hyacinths. The insects referred to are oval with many legs. They come out of the old planks on the cellar stairs and floor. What is the best variety of fern for house culture the Boston or the Ostrich plume?

The writer had better put the bulbs on a hanging shelf or some such arrangement to protect them from the wood lice. They can be killed with slices of raw potatoes dipped in Paris Green, but suspension of bulbs or placing the container on legs set in dishes of water is much more practical. The injury of bulbs by wood lice as described is very unusual. The ferns referred to are both most satisfactory and the varieties as regards care of culture entirely a matter of personal choice.

A. A. B., of St. Andrews, N. B., writes:—We have an old palm that is so large that it fills a whole window. It is planted in a tub set on rollers. It is getting brown at the tips and seems to require repotting, but to pot it into a larger vessel is entirely out of the question. Can you suggest any thing that we can do to feed it so that we can keep it alive without repotting? The surface soil in the tub is a solid mass of tradescantia, does this injure the plant?

Remove the tradescantia, which certainly takes much strength from the soil. Scrape all the top soil off that you can without injuring the roots too much and fill in with rotted or even fresh cow manure—rotted is best. This should carry the plant another season at least, if the roots are all sight.

I have been given some bulbs called Ixias; what are they like and how should they be cultivated?

The Ixias makes a very pretty winter flowering bulb, of many bright colors. One distinctive feature is that the middle of the flower is always distinct from the centre in color. They come out from the side of a grass-like stalk and are rather striking. Plant six or eight bulbs in a six inch pan covering them about one inch deep.

Prevention of Concrete Dust.

Cement floors, particularly in office buildings or warehouses, which do not have the advantage of obtaining the necessary moisture from the atmosphere, such as outside floors and sidewalks on which the dew falls at night, if not properly protected and kept damp, become prematurely dry and therefore more or less porous, and weak, causing easy abrasion under foot traffic, or what is commonly known as dusting.

Care should be exercised in keeping such floors damp by covering with wet sand, wet hay or straw, for a week or more until the floor has properly hardened. If this has not been done and the floors are found to dust under foot traffic, the following remedy will be found very easy to accomplish, economical and effective:

Wash the floor thoroughly with clean water, scrubbing with a stiff broom or scrubbing brush, removing all dirt and loose particles. Allow the surface to dry; as soon as dry apply a solution of one part waterglass (sodium silicate) of 40 degrees Beaume, and 3 to 4 parts of water, the proportian of water depending uponthe porosity of the concrete. The denser the concrete the weaker the solution required. Stir well, apply this mixture with a brush (a large whitewash brush with a long handle will be found the most economical). Do not mix a greater quantity than you can use in an hour.

If this solution is sufficiently thin, it will penetrate the pores of the concrete. Allow the concrete surface to dry. As soon as dry, wash off with clean water, using a mop. Again allow surface to dry and apply the solution as belore. Allow to dry and again wash off with clean water, using a mop. As soon as the surface is again dry, apply the solution as before. If the third coat does not flush to the surface apply another coat as above.

The sodium silicate which remains on the surface, not having come in contact with the other alkalies in the concrete, is readily soluble in water and can therefore be easily washed off, thus evening up the color and texture of the floor. That which has penetrated into the pores, having come in contact with the other alkalies in the concrete, has formed into an insoluble and very hard material, hardening the surface, preventing dusting and adding materially to the wearing value of the floor.—Albert Moyer.

FELL FROM A HAY LOFT

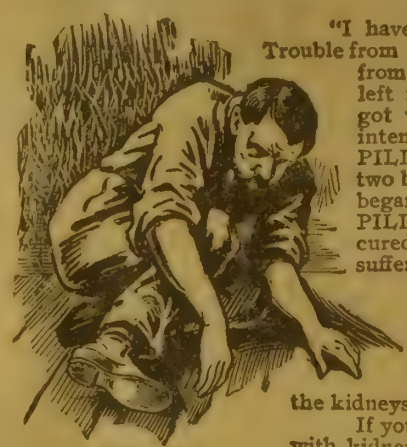
Suffered Tortures With His Kidneys Until He Tried Gin Pills

You might think that Mr. Baker needed a surgeon more than GIN PILLS. But there were no bones broken. His back was strained, which was harder to cure because nothing seemed to do any good. It is the same with a sprained ankle and broken leg. You can set the fracture and it will be well in six weeks—but the sprain may take months to get well.

However, Mr. Baker found the quick way to get relief from the pain—here are his own words.

AULTSVILLE, ONT.

"I have been a great sufferer from Kidney Trouble from an injury to my back caused by falling from a hay loft about six years ago. This left my kidneys weak, so that every cold I got would settle in my kidneys and cause intense suffering. I was advised to try GIN PILLS. I found, to my surprise, after taking two boxes, that the pains were relieved and I began to feel better. I am still taking GIN PILLS and feel sure I will be completely cured. I recommend GIN PILLS to all who suffer from any Kidney Trouble". C. BAKER.



A BAD FALL

You see, the fall had strained the kidneys and they were affected by the slightest chill. GIN PILLS immediately strengthened the kidneys—soothed any irritation and thus enabled the kidneys to overcome the effects of the fall.

If you are having pain in the back—or trouble with kidneys or bladder through accident or overwork—do just as Mr. Baker did—take GIN PILLS. They will help you—cure you—or we will promptly refund your money. Buy six boxes at your dealer's. If, after taking them, you feel that Gin Pills have not helped you, return the empty boxes and get your money. We will take your word for it. 50c. a box, 6 for $2.50. Sample box sent free if you write National Drug and Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS regulate the bowels and cure Constipation, Biliousness and Indigestion. 25c. a box. 111

For a sprain you will find Chamberlain's Liniment excellent. It allays the pain, removes the soreness and soon restores the parts to a healthy condition. 25 and 50 cent bottles for sale by all dealers.

A C. P. R. Model Farm.

A model farm for illustration purposes, is to be started in New Brunswick by the Canadian Pacific Railway. The matter has been under consideration for about a year, and the railway company has in view several farms which will serve the purpose. The actual purchase has not yet been announced, but it is expected that a farm will be bought in time to allow the railway to commence operations this spring.

The principal motive of the company in undertaking this new venture is to show what can be done on a New Brunswick farm. Experts will be be employed and the most scientific methods will be used, from the selection of the crops and the preparation of the soil to the harvesting and marketing, everything will be done on the most modern lines.

Not only will an effort be made to secure the best possible results from the crops which are now generally raised in the province, but experiments will also be made with others which are not so common, or have not been introduced here, for the purpose of learning the success with which they can be adapted to our soil and climate.

The farm will be operated somewhat on similar lines to the Government farms in other provinces, and will be a valuable contribution to the agricultural interests of New Brunswick. It will be for the benefit of farmers, and in order to give as many as possible an opportunity to visit it and profit by the practical lessons taught there, excursions will be run periodically from different parts of the territory served by the C. P. R.

Parts of the products of the farm will be used in supplying the dining car and hotel departments of the railway.

P. E. I. Provincial Seed Fair.

The seed growers of Prince Edward Island are preparing for their Annual Provincial Seed Fair, which will be held at Summerside, P. E. I. on March 5th and 8th inclusive. The P. E. I. Provincial Seed Fair is, unquestionably, the largest Seed Show on the American continent. The contests in the respective classes are always keen, and the very best seed grain grown on Prince Edward Island will be there. The Fair is a good place to meet with honest farmers who will supply seed grain true to name in large or small quantities, at fair prices.

Herbaceous Perennials.

There are, undoubtedly, a great many of our readers who are interested in a study of Herbaceous Perennials who would like to get a bulletin on this subject.

If such parties will write making known their requests to the Dominion Horticulturist, Central Experimental Farm, Ottawa, a copy of a bulletin on Herbaceous Perennials, written by Prof. W. T. Macoun, Dominion Horticulturist, will be forwarded to them.

Cumberland County Farmers' Association.

Editor Maritime Farmer:—

The Annual Meeting of the Cumberland County Farmers' Association was held in Amherst on January tenth. On account of the day being so stormy, the attendance was small.

The minutes of the last meeting were read and approved.

A reply to the letter of thanks to W. W. Andrews was read, in which he stated that he was glad if anything he had done was of benefit to the farmers and that marshland, now worth fifty dollars an acre could be made to be worth one hundred and fifty dollars an acre in a very short time.

The directors' and secretary's reports were read and adopted. The officers were re-elected, two more directors being appointed, W. A. McKenzie, Malagash and W. R. Oulten, Lorneville.

Mr. Jackson, Westchester and Mr. S. A. Logan were appointed delegates to N. S. Farmers' Association, alternates, Laurie McFarlane, Fox Harbor, Hiram Brown, Wallace Bay and Mr. Robertson.

Several matters were looked into and different problems discussed, including the hired help problem.

The membership, we regret to say, has decreased thirty-eight since last year. We hope to see it increased by a good majority in 1912.—R. R. B.

your Province
WRITE your name and address in the lines above, clip out this ad, and mail it now. We will send, by return mail, a book that tells how to make yours a "Twentieth Century" farm.
You wouldn't be satisfied to use a scythe to cut your grain, when a modern harvester can do it so much better, would you?
Nor to use the old soft-iron plough-share that your ancestors walked behind, when you can get an up-to-date riding plough?
Every Canadian farmer realizes the advantages of Twentieth Century implements.
The next step is
The 20th Century Material—Concrete
Concrete is as far ahead of brick, stone, or wood as the harvester is ahead of the scythe or the riding-plough is ahead of the old iron plough-share.
Concrete is easily mixed, and easily placed. It resists heat and cold as no other material can; hence is best for ice-houses, root-cellars, barns, silos and homes. It never needs repair; therefore it makes the best walks, fence-posts, culverts, drain-tiles, survey monuments, bridges and culverts. It cannot burn; you can clean a concrete poultry-house by filling it with straw and setting the straw afire. The lice, ticks and all germs will be burned, but the house is uninjured.
It is cheap—sand and gravel can be taken from your own farm. Cement, the only material you must buy, forms from one-seventh to one-tenth of the whole volume.
Do you want to know more about Concrete on the Farm? Then write your name and address in the lines above, or on a postcard, mail it to us, and you will receive by return mail a copy of
"What the Farmer Can Do With Concrete"
Not a catalogue, but a 160-page book, profusely illustrated, explaining how you can use concrete on YOUR farm.

Why Don't You Plant
EWING'S
Reliable Seeds
What's the use of giving your land, your time and your work for a season for anything less than the best crops? Ewing's Reliable Seeds have proved, for more than forty seasons, favorable and unfavorable, that they will produce the highest crops of the best quality. Ask your neighbors who plant Ewing's Seeds all about them. Plant them yourself this spring and get the full reward for your work. Your dealer should have Ewing's Reliable Seeds, but if he hasn't, write for our illustrated catalogue and order from us direct.

EWING'S RELIABLE SEEDS

Field Crops for 1911.

The Census and Statistics Office of the Department of Agriculture has issued the following bulletin giving the final estimates of the area, yield and value of the principal field crops of the Dominian for 1911. The field crops of Canada are shown to have occupied last year a total area of 32,-853,000, and their value, calculated at the average local market prices, amounts to $565,712,000. The area under wheat last year was 10,374,000 acres, of which 1,172,000 acres were fall wheat in Ontario and Alberta, and the production was 215,851,000 bushels of the value of $138,567,000. Fall wheat produced 26,014,000 bushels of the value of $21,461,000. Oats occupied 9,220,800 acres, and yielded 348,188,000 bushels of the value of $126,812,000, barley 1,404,000 acres yielded 40,641,000 bushels of the value of $23,004,000 and flax 1,132,000 acres yielded 12,921,000 bushels of the value of $19,467,000. The combined area under rye, peas, buckwheat, mixed grains and flax was 2,481,000 acres, the yield 44, 986,000 bushels and the value $41,560,000. Hoed and cultivated crops, comprising beans, corn for husking, potatoes, turnips and other roots except sugar beets occupied 1,-063,000 acres, and yielded 170,884,000 bushels of the value of $73,290,000. Sugar beets in Ontario and Alberta had an acreage of 20,878 and a yield of 177,000 tons of the value of $1,165,-000. Fodder crops including fodder, corn, hay, clover and alfalfa show an acreage of 8,290,000, a production of 15,499,000 tons and a value of $161,-314,000. Alfalfa, a record of which was taken for the first time, shows an area of 101,781 acres with a yield of 227,900 tons. This valuable fodder crop is being principally grown in Ontario, Quebec and Alberta, the average yield per acre for the whole of Canada being 2¼ tons.

For the year 1911 the areas from which the yields are calculated were those of the recent Census and the resulting data are not therefore strictly comparable with the estimates of the three previous years which were based upon the reports of selected correspondents. It may be mentioned however that tne area and production of wheat in 1911 exceed by over 1,000,000 acres and 65,862,000 bushels the estimates of 1910. A more satisfactory criterion of the difference between the two seasons of 1911 and 1910 is afforded by the average rates of yield per acre which for fall wheat was 22.19 bushels in 1911 against 23.49 in 1910, spring wheat 20.63 against 15.-3, oats 37.76 against 32.79, barley 28.94 against 24.62 and flax 11.41 against 7.97.

In the three Northwest provinces of Manitoba, Saskatchewan and Alberta the wheat production was 194,083,000 bushels compared with 128,891,000 bushels the estimate of 1910 of oats 212,819,000 compared with 126,753,000 and of barley 24,043,000 compared with 21,377,000. The wheat production of 1911 in Manitoba was 60,275,-000 bushels from 2,980,000 acres, in Saskatchewan 97,665,000 bushels from 4,705,000 acres and in Alberta 36,143,-000 bushels from 1,617,000 acres.

By provinces the total value of all field crops in 1911 was as follows: Prince Edward Island, $8,846,700; Nova Scotia, $14,297,900; New Brunswick, $16,797,000; Quebec, $103,187,000; Ontario, $193,260,000; Manitoba, $78,-136,000; Saskatchewan, $107,147,000; Alberta, $47,750,000; British Columbia, $1,290,000.

Owing to the exceptionally mild weather which prevailed during the fall and early winter live stock are reported as having entered winter quarters in excellent condition. As a general rule winter supplies are ample.--Archibald Blue, Chief Officer.

New Brunswick Apples.

By the courtesy of the Company we have been able to examine a selection of the apples grown upon the property of the St. John Valley Farm and Fruit Land Company, Burton, N. B. There is no doubt wnatever that these apples will always command favour in the Home market, alike by reason of their excellent colour and appearance, condition, flavour, and all-round quality. An apple of this high class can always command high prices in England, and is a credit both to its growers and to the land which produces it.

It is interesting to note that, so far as the fertile Province of New Brunswick is concerned, the St. John Valley Company is the first Company to take up systematically the question of offering small fruit farms to settlers and to adopt apple-growing themselves on an organized commercial basis. There is undoubtedly a great future before this most agreeable form of farming in New Brunswick. The St. John Valley Company's holdings at present comprise fully a thousand acres, part of which they retain as a commercial orchard, while the balance is divided up into convenient fifteen acre orchard lots for sale to settlers and the public. If the Company's own fruit products may be regarded as a specimen, it is safe to assume that no part of Canada will yield better returns to the orchardist. Would-be settlers should address their inquiries to the New Brunswick Government Office in Southampton-street.—Standard of Empire, London.

The Cape Breton Poultry Show.

A very succesful Poultry Show was held in North Sydney, N. S., on January 16th and 17th. Although this was the first Show held under the auspices of the Cape Breton Poultry Association, the showing made was very creditable. There are some poultry fanciers in the vicinity of the Sydneys who have been able to make matters hum in their classes at the Winter Fair and Provincial Exhibition. Their example is doing much towards creating a deeper interest in poultry culture in their respective localities.

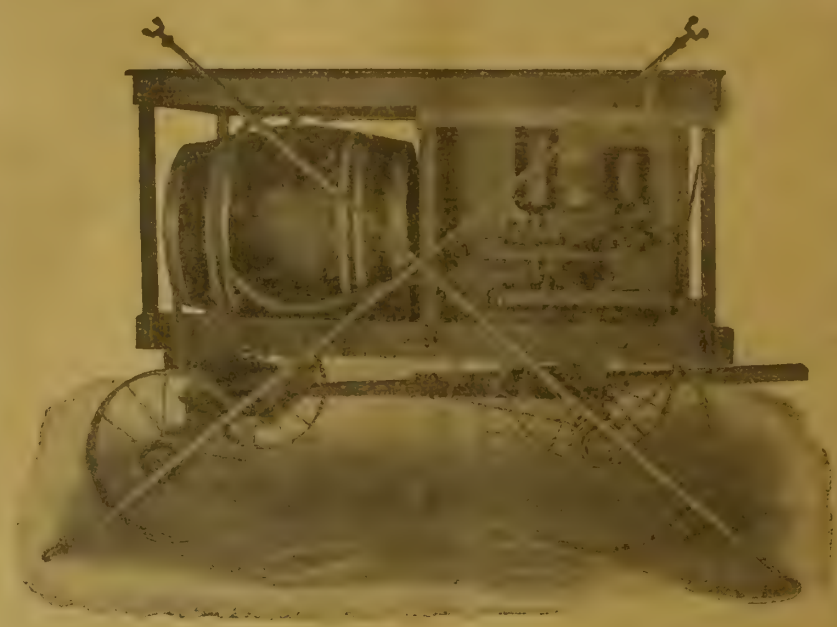
Some Good Sales.

H. W. Corning, M. P. P., Chegoggin, N. S., writes:—I made some good sales last week. I sold the two-year-old Clydesdale Stallion, Baron Corning to the Fraser Lumber Co., of Plaster Rock, N. B., at a nice price. I believe this colt will be heard from later as he has a lot of quality and he will make a mighty, trim horse.

In Guernseys, Dairymaid of Hillside dropped a beautiful bull calf on January 25th. This calf was sold the day he was dropped for $150.00 when six weeks old. He was bought by Prof. J. H. Grisdale to head the Guernsey herd at the Dominion Experimental Farm, Ottawa.

I also sold a very fine young bull, eight months old to head the herd of J. W. Flatt, of British Columbia. This bull, is also out of a Record of Performance dam and should do credit to the Maritime Province Guernseys, when he arrives on the Pacific Coast.

"Simplicity" Power Sprayer



If you want satisfaction in a Power Spraying outfit buy a "Simplicity." It is compact, simple and the most durable machine on the market.

Not Better than the Best, But Better than the Rest.

Also a complete line of Hand Sprayers and Parts.

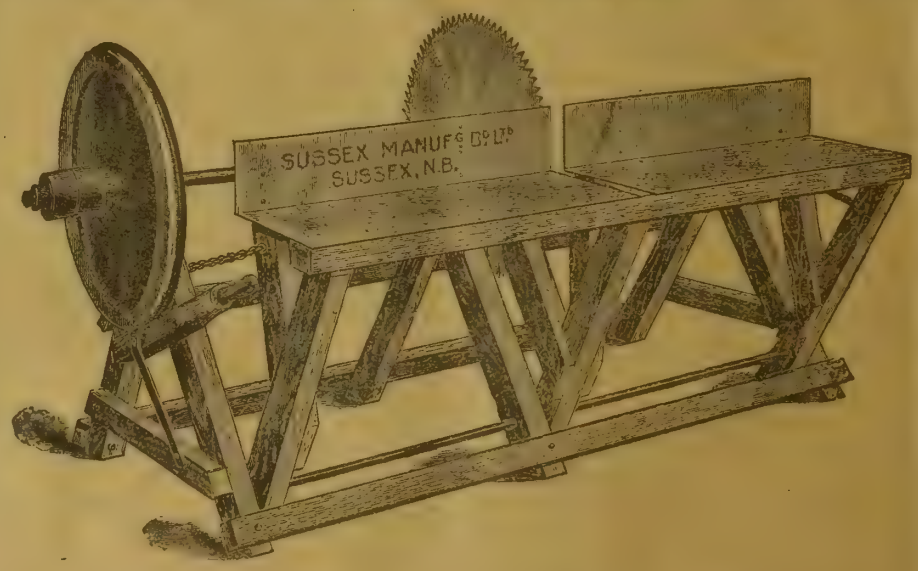
Wood Cutters Made in Three Sizes.



We make the best Wood Cutter on the market. The length of table on our Long Swing is 8 feet, 3 inches; distance between balance wheel and saw 4 feet, 3 inches. Heavy substantial frame and well braced. Steel plate table.

Length of table on Flat Rolling Machine is 8 feet, 3 inches; distance between balance wheel and saw 4 feet 3 inches. The table of this machine moves on grooved rollers and vd. track, which holds the table in position, making it move very easily to and from the saw.

Our Short Swing is built on the same principles as the Long Swing, the arbor and frame is shorter; length of frame 4 feet, 3 inches; distance between balance wheel and saw 3 feet, 6 inches.

On all our machines the arbor is the same size, made of the best turned steel and runs in bearings of the best babbitt. The balance wheel is a solid web and weighs 180 pounds.

We have a large number in stock and can ship promptly. All enquiries will have prompt attention.

"Arguments in Favor of Home Mixing."

Extract from

"Artificial Fertilizers; Their Nature and Use"

By B. Leslie Emslie, F.C.S., P.A.S.I., C.D.A.

"1. ECONOMY: Usually at least 25 per cent. is saved in purchasing the separate ingredients. There is no useless "filler" to add to the freight charges; there is no duty on the separate ingredients, whereas the farmer must bear the cost of the duty imposed on the ready mixed fertilizers when these are imported from the United States.

2. ASSURANCE. The farmer who purchases the separate ingredients, especially if he insists on getting the goods in the original sacks, knows exactly what he is getting for his money; whereas the purchase of a ready mixed brand is more often like buying a "pig in a sack."

3. ADAPTATION. With a stock of the separate ingredients on hand, the farmer is enabled to make up his mixtures according to prescriptions which he has prepared to suit the varying requirements of the different crops and soils.

From this short resume each farmer may judge for himself whether, in his case, it will pay him to purchase the separate ingredients in preference to the ready mixed goods."

Farmers may obtain copies of this, as well as other important bulletins on this important subject, by applying to

Waterfowl in Winter.

Geese can do with warmer quarters than turkeys, as long as the floor is not damp and dirty. Keep lots of straw on the floor of the pen, so as to keep it clean and dry. On the farm the geese can be allowed the run of the barnyard during the day, as long as they have comfortable quarters at night.

A shed opening on the farmyard with the cracks covered with cleats or paper, so as to stop drafts, makes a very good spot for geese. As long as their feet are warm they are all right, and plenty of straw will fix them up in this respect.

Geese will eat almost any kind of grain. I find that oats make about the cheapest feed, and I feed this together with some corn on cold nights. Give plenty of water, grit and green food, such as beets, cabbage, etc.

Ducks require much the same treatment as geese, although it is not advisable to let them run out in the snow much. Needless to say, ducks, like geese, do not require any roosts, so all you need to do is to keep the floor dry and covered with plenty of straw and you have them fixed all right. Avoid drafts and cold, wet floors.

Ducks will eat almost anything. All grains look alike to them. They have a special liking for a pail of hot mash on a cold morning and some fresh water with the chill taken off. Give plenty of green feed and grit, and if you want to be real good to your stock on cold days, warm some corn in the oven for the night feed.

Valuable Book of Accounts for Farmers

Readers of this paper should take advantage of the generous offer of the Bickmore Gall Cure people in our advertising columns and write for their free Farmers' Account Book. This one is specially designed for farm use. Farmers find it much better suited to their wants than ordinary books they get at the store. It is not merely a "ledger" or time book, but is gotten up in right form to enable farmers to keep just such accounts as they ought to keep. If they will use this book as they should their business will be better systematized, they will know more about their accounts, will have a more accurate idea of what brings in a profit, where the losses are, how much they are making, etc. The book is prepared and published by the makers of Bickmore's Gall Cure, that long-time sovereign remedy for galls, sore shoulders, wire cuts, etc.—the remedy which "cures while you work the horse." Nearly every horse owner has heard of Bickmore's Gall Cure. It is a remedy which well deserves a place in every stable. It is not necessary to send postage for the Farm Account Book. Simply write the Bickmore Gall Cure Company, Box 37, Old Town, Maine, and say you would like to have it.

FREE

Handsomely Decorated Dinner Set

Ladies. We will give you this beautiful full size dinner set absolutely without cost.

This is the Chance of a Lifetime. An Honest Proposition.

We will give away free 1,000 of these handsome dinner sets, beautifully decorated, each set 58 pieces, latest designs, handsome patterns, full size, for family use. A magnificent and complete set to quickly introduce and advertise Dr. Burdick's famous New Life Vegetable Pills,—the wonderful remedy for indigestion, constipation, unhealthy blood, rheumatism, to stimulate the appetite, regulate the bowels and clear the complexion, an invigorator, tonic, and blood purifier. We will make you a present of this handsome set exactly as we offer it. Take advantage of this if you want to get a handsome set of dishes for your home, absolutely free.

All We Ask You to Sell is Only 12 Boxes at 25c a Box

of Dr. Burdick's famous New Life Vegetable Pills. Being determined to gain a national reputation as the most progressive firm in Canada, and to gain a wider distribution of our strictly pure, high-grade remedies, we are going to assist you to sell our medicine, and to earn this beautiful set quickly, by sending with each box of pills a certificate by which every purchaser can receive from us a Handsome Box of Presents consisting of 1 handsome solid gold shell ring, plain engraved, and chased or set with beautiful sparkling jewels, equalling in appearance the finest diamond rubies and sapphirs, etc., 1 sacred Resurrection Plant of Egypt—The Rose of Jericho as spoken of in the Bible; 1 pair gentlemen's Imported Lever Cuff Links, Gold finished, your choice of a handsome Silver finished Sugar Shell, silver finished Butter Knife or Silver finished Pickle Fork; one cabinet photograph of our King in his royal uniform, and our Queen in full court dress. This magnificent box of presents, exactly as described, we will send fully prepaid to every one who purchases a box of our medicine from you, and will return us the certificate with only 50c. to cover cost of packing, mailing, etc., the different articles. Our object in making this wonderful offer is to induce people to try our medicine, and to receive the opinion of every purchaser, and this we will get when the certificate is signed and returned to us. This liberal offer makes it impossible for you to fail. Your friends will be delighted with this wonderful opportunity to secure a handsome box of presents.

Don't miss the opportunity of a lifetime. Write us to-day and agree to sell only 12 boxes, and return the money, only $3.00 to us. We trust you with our medicine till sold. As soon as your remittance and the certificates have been returned to us, we will promptly ship the dinner set to you. We arrange to stand payment of all freight charges to your nearest station. We are bound to introduce Dr. Burdick's famous medicine no matter what it costs us and when we say we will give away these handsome sets of dishes, we will do it. **Our methods are honest. Don't miss this great opportunity.** Write to us at once. Address.

Mr. Wise Grocer says:

The One Big Difference

between the Ordinary, Wooden, Wire-hooped Pail or Tub and the Pail or Tub made of EDDY'S FIBREWARE

is that the Former loses its Hoops and Goes Back into the Pieces which Formed it, while the Latter is a Solid, Hardened, Lasting Mass, without a Hoop or Seam.

And, besides, EDDY'S FIBRE PAILS AND TUBS have Many Features that you'd Never get the Good of if you Purchased the Inferior Wooden Articles Positively Persist in getting EDDY'S.

ALWAYS, EVERYWHERE, IN CANADA, ASK FOR EDDY'S MATCHES

Tank Heater Wanted.

We have an inquiry from one of our subscribers re a small size tank heater for warming water for stock. If any of our readers use a heater of this kind, will they be kind enough to forward us a description and the name of the manufacturers?

Violent Crossing.

Dr. J. G. Rutherford, among some brief rules for horse-breeders, has the following: Avoid violent crossing. All deformed colts are not caused by mental impressions, very many being due to the foolish but too common practice of serving small, light mares to heavy draught sires. It is well known that some stallions are notorious for this sort of thing, and it is a curious but instructive fact that the worst offender I ever knew was himself a small horse, but bred from extra heavy Clydesdale stock on both sides of the house. While this is, perhaps, the most objectionable, all violent crossing will be found, as a rule, unsatisfactory.

HAD WEAK and DIZZ YSPELLS

COULD NOT SLEEP AT NIGHT.

People all over this land toss night after night on a sleepless pillow, and do not close their eyes in the refreshing slumber that comes to those whose heart and nerves are right.

The sleeplessness comes entirely from a derangement of either the heart or nerves, or both, but whatever the cause Milburn's Heart and Nerve Pills offer the blessing of sound refreshing slumber. They do this by their invigorating effect on the heart and nerves, and will tone up the whole system to a perfect condition.

Mrs. A. E. Martell, Rockdale, N.S., writes:—"I was troubled for a long time with my heart, had weak and dizzy spells, could not sleep, and would have to sit up the greater part of the night, and it was impossible for me to lie on my left side. At last I got a box of Milburn's Heart and Nerve Pills, and they did me so much good I got another, and after taking it I could lie on my left side, and sleep as well as before I was taken sick. They are the best medicine I ever heard of for heart or nerve trouble."

Price 50 cents per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont. will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child. the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

The New Brunswick Farmers' and Dairymen's Association.

The 1912 Annual Meeting of the N. B. & D. A. will meet in Fredericton, N. B. on March 18th to 22nd.

The morning and afternoon programme will consist of Live Stock Judging Classes as follows:

Light Horse Classes, Tuesday, A.M.
Heavy Horse Classes, Tuesday, P.M.
Dairy Cattle Classes, Wednesday, A.M.
Beef Cattle Classes, Wednesday, P. M.
Sheep—Wool Classes, Thursday, A. M.
Seed Judging, Thursday, P.M.
Seed Judging, Friday, A.M.

Evening Meetings will be held on Monday, Tuesday, Wednesday and Thursday evenings commencing at 8 P.M.

Among the experts who will speak at these meetings will be: Dr. Geo. M. Twitchell, Augusta, Me.; Prof. H. S. Arkell, Ottawa; Dr. Jno. Standish, V. S., Truro; Prof. E. S. Archibald, Truro; Mr. C. F. Whitley, Chief of Cow Testing Branch, Ottawa; Mr. G. C. Cutler, McDonald College; Mr. S. J. Moore, Truro and others.

A large delegation of farmers is expected. Plan to be present with the rest of your progressive co-workers and help to make these meetings the most successful in the history of the N. B. F. & D. A.

Worth More Than We Ask For It.

Mr. G. A. Fawcett, Grower and Shipper of Potatoes, Sackville, N. B., in renewing his Maritime Farmer subscription for the ensuing year, writes:

Your well printed paper with its sound editorials and enterprise is well worth $1.00 although you only charge eighty cents per year when paid in advance. Since September 11th, 1911 I have shipped seventy-four car-loads of potatoes. Some buyers to whom I sold wrote: "I saw by your ad, in the Maritime Farmer that you are a grower and shipper of potatoes." A firm in Carleton Place, Ontario even enclosed a clipping from one of your April 1911 issues containing my ad. I look upon the three Maritime Provinces as offering by far the best opportunities for happiness and prosperity of any spot in our Dominion. Our schools are grand; our markets are good enough for any man and our church privileges are unexcelled."

The New Brunswick Provincial Seed Fair.

The New Brunswick Provincial Seed Fair will be held in Fredericton, on Thursday and Friday, March 21st and 22nd. The prize list now on the press has places for one bushel samples of White Fife, Red Fife, White Russian and Any Other Variety of Wheat. There will also be a competition open to all varieties of wheat. The entries in the latter section must be separate bags from the bags entered in the other sections. The prizes in each of the wheat sections are seven in number and range from $4.00 to $1.00.

Ib oats, Banner, Early Blossoms, Any Other White Variety, Any Black Variety and a special competition, open to all varieties are provided for by prizes ranging from $5.00 to $ .50. Two rowed and six rowed Barley are provided with an offering of six prizes ranging from $3.00 to $ .50 in each section, and similar amounts are offered for two classes of buckwheat, rough and smooth.

Six prizes ranging from $3.00 to $ .50 are offered in the following sections: Field Peas, large, Field Peas, small, Garden Peas, Beans, colored, Beans, white, Timothy Seed, Clover seed, red, Alsike and white, Corn, any field variety and sweet corn.

Potatoes come in for seven prizes ranging from $3.00 to $ .50 in classes for Green Mountains or Delawares, Irish Cobblers, Any Other Long White Variety, Any Other Round White Variety, Rose Type, long, Rose Type, round, Red Skinned, any variety, and Dark Skinned, any variety.

Potato Onions, Turnip Seed, Carrot Seed, Six Turnips for seed raising and six Mangolds for seed raising will have four prizes ranging from $2.00 to $ .50 in their respective classes.

Lectures on Seed Production and general discussion by prize winners who will be asked to describe their methods will be given at the closing session of the Seed Fair.

Each and every farmer in New Brunswick is invited to send exhibits and also to visit the Fair.

$150.00 to $250.00 Per Cow.

H. S. Pipes & Son, Amherst, N. S., write:—The Bayview Farm Jerseys have rounded out the year 1911 with $150 per cow cash received for milk, cream, butter and buttermilk.

There has been no account made of the products consumed in the home nor has there been one pound of skimmilk credited to the cows.

When they are credited with skimmilk fed to twelve or more calves during the year the cash returns per cow is over $200.

The herd of some 42 head are in prime condition and are delivering a choice quality of cream and milk, so our patrons tell us.

A pair of Blue Blood heifers dropped their first calves about the fifteenth of December and are doing grand work, although the temperature was ten degrees below zero.

Bonnie Blue, the heifer that won first money at the fall show, as a two year old, is now giving as high as 20 lbs. milk at one milking.

An Encouraging Message

I have a message of hope and good cheer, of encouragement and inspiration to every suffering woman. I have endured the torture due to female troubles and the consequent despondency and mental agony almost to the point of despair, and I have been restored from this condition to a state of vigorous health, and to the happy, exhilarating frame of mind which accompanies physical well being. This change has been brought about wholly by the use of ORANGE LILY.

In addition I have had the privilege and pleasure of inducing multitudes of other suffering women to give ORANGE LILY a trial, and have received thousands of enthusiastic acknowledgments of the blessings it has brought to them. The following is a sample:

Truro, N. S., April 5, 1909.

Dear Mrs. Currah,—Your very kind letter was received yesterday. In reply to your question about my health, I am thankful to say that I am very well. As I have never given you a statement of my case you may be interested in it.

For several years I have suffered untold agony. This suffering was continuous, but I would have violent attacks every few weeks, each attack lasting several days. The first Sunday in November, I felt the pain increasing and so did not go to prayers. The rest of the family did go, and soon after the forcing down pains seized me and I had to remain on the floor until their return. I was in great pain all night and was very sick for a whole week.

Then Mrs. L. came to see me and told me of your wonderful medicine. I got my husband to send for it right away, as I was too sick to write myself. (My doctor could do nothing for me.) I have used 5 boxes of ORANGE LILY, have had three months of good rest, and am now well, never better in my life. I have not had the old pains since. I often ask my husband if it is myself that is going around and doing my own work. I can scarcely believe it. It brings tears of joy to my eyes. I could shout it to all the world. I cannot speak enough in its praise.

Your friend, MRS. E. H. F.

Receiving, as I do, dozens of such reports each day, I feel impelled to make known to my suffering sisters the merits of ORANGE LILY. It differs from other so-called remedies in that it is not taken internally. It is a strictly local treatment, and is applied directly to the affected organs. Its curative elements are absorbed into the congested tissues, expelling the stagnant foreign matter which has been irritating the membrane and oppressing the nerves, and a growing feeling of physical and mental relief is noticeable almost from the start. It is a positive, scientific remedy, and even if you use no more than the Free Trial treatment you will be very materially benefited.

FREE TRIAL OFFER

I want every reader of this, who suffers in any way from painful monthly periods, irregularities, leucorrhoea, inflammation or congestion of the womb, pains in the back, etc., to send me their addresses, and I will forward at once, without charge, 10 days' treatment. If your case is not far advanced it may entirely cure you, and in any event it will do you much good. I am so earnest in making this statement, and so positive that it is true, that I trust every sufferer who reads this notice will take advantage of my offer and get cured at home, without a doctor's bill. Address, enclosing 3 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

It Pays to Advertise.

Wm. Clark & Sons, Maple Grove Farm, North Wiltshire, P. E. I., write:— 'The bull calf from Sylvia of Maple Grove advertised in a recent issue of the Maritime Farmer has been sold. We received three orders for him within a week of the time our advertisement appeared. The first offer came from Mr. D. R. Crockett, Alma, Pictou Co., N. S., who has become the possessor of this very promising calf. Mr. Crockett evidently believes in getting the best, both in breed and in individuality. We hope to be able to supply the other gentlemen who wrote for this bull with some equally good ones.

This is the season of the year when mothers feel very much concerned over the frequent colds contracted by their children, and have abundant reason for it as every cold weakens the lungs, lowers the vitality and paves the way for the more serious diseases that so often follow. Chamberlain's Cough Remedy is famous for its cures, and is pleasant and safe to take. For sale by all dealers.

Health Board Advises Dairymen.

In its September report the Massachusetts state board of health favors dairymen with a dozen and a half "don'ts." They are given herewith. The New England Homestead annexes three of its own brand. Read all through and suggest a few things yourself.

1. Don't take it as a personal insult if boards of health criticize dairymen for the way they run their business.
2. Don't buy or keep diseased cattle. They may, and often do, infect the rest of your herd. Have a competent veterinarian examine all animals every six months.
3. Don't sell milk from cows suffering from tuberculosis, garget, cowpox, anthrax, foot and mouth disease.
4. Don't make the mistake of thinking any place is good enough to keep cows in. Give each cow 500 cubic feet of air space, 4 square feet of light, and plenty of fresh air.
5. Don't store manure in, under, or near the barn. Remove it daily a distance of at least 50 feet.
6. Don't allow water or liquid manure to collect in pools in the barnyard.
7. Don't keep pigs in, under, or near the barn. Most pig pens are very filthy and breed flies, and flies carry disease germs to the milk pail.
8. Don't use horse manure for bedding the cows.
9. Don't fail to keep the cows clean.
10. Don't sweep, throw down hay, or otherwise stir the dust, within an hour before milking.
11. Don't milk unless your hands and clothing are clean.
12. Don't have outhouses near the cow tie-up.
13. Don't have anything to do with the milk if you are not feeling well.
14. Don't use a broad open pail for milking.
15. Don't strain or handle the milk back of the cows. Always use a milk room.
16. Don't use utensils that are rusty and rough inside.
17. Don't fail to cool your milk as soon as possible to 50 degrees, and keep it there during storage. Never cool milk in a water trough, and use plenty of ice.
18. Finally, don't forget that all that health authorities wish you to do is to produce a safe, healthy milk.

The editor has some don'ts for the state board of health.

1. Don't send a bunch of idiots into the country to enforce above rules, and tell farmers where to get off.
2. Don't expect dairymen who are already underpaid for the high quality product they produce to continue the work of reform indefinitely without reasonable compensation.
3. Don't think the farmer is inherently opposed to clean milk, and the campaign waged therefore by boards of health. He favors both; only he wishes to be sure of a square deal, and feel that the campaign for sanitary milk is not lopsided. The middlemen and consumers themselves have important rules too seldom spoken of.

A Familiar Friend of 100 Years Ago.

Marvelous changes have been wrought in the way of living in the last 100 years. We prepare our food in a different way, we eat differently, dress differently, are taught differently in the schools. If we stop a moment to compare our "ways" with those of a hundred years ago, we are almost led to believe that everything has changed and everything has been improved.

In the mateer of treating our ailments the changes are no less noticeable than in other things. Old ways and old methods are gone. Amid all this change, however, we are almost startled when we think of one household preparation which has come down to us out of the remote past unchanged, and which is today more highly respected than ever before. We refer to that old reliable household remedy, Johnson's Anodyne Liniment, which has been used continuously by the people of this country for 101 years.

One hundred years is a long time. To go back to when it began is to get out of the age of the flying machine, the automobile, the telephone and the telegraph to a time when such things were not even dreamed of. It goes back beyond the steam railroad into the realm of the stage coach. The steamboat was a hundred years ago a new thing. In 1810, when Johnson's Anodyne Liniment was first compounded, James Madison, 4th President of the U. S., had just been inaugurated. Abraham Lincoln was then a one-year-old baby. The country then had less than one-tenth of the population it now has and not one in a hundred thousand of its present 90 million people had then been born.

With the age of this 101-year-old friend goes respectability. The respect is due solely to its virtues. It could not have lived over 100 years if it had not been one of the most efficient remedies the world has ever known for the aches and pains, the ills and ailments to which the human family is subject. During its lifetime thousands of other liniments have come and gone and been forgotten. The 101-year-old liniment lives and grows in the affections of the people. Where it has once been used in a family it is a rare thing that anything else has ever been found to take its place. Thus, in innumerable households it has come down, like a valued heirloom, from father to son for generations.

The Anodyne Liniment is manufactured by I. S. Johnson & Co., Boston, Mass., and is sold by dealers generally throughout the country.

Weight Instead of Measure.

In these days when the cost of all sorts of foodstuffs is so high, it is a matter of necessity that the measure and quantity should be standardized sale of vegetables, eggs, and even and strictly enforced. More particularly should this be the case in the fruit. In the days when potatoes sold for from 50 to 80 cents a bag, people did not consider it a matter of much importance exactly what the bag contained or how much it weighful tubers runs up to $2 a bag and ed. But when the price of these useover, as it has done this winter, each potato has a distinct commercial value. And when it comes to selling by measure the amount of air space in a bag for which the consumer has to pay will be considerable. The Market Gardeners' Association are themselves in favor of selling by weight, so as to standardize the price. A "bag of potatoes" is an elastic quantity. Some bags contain not much over a bushel, while others contain more than a bushel and a half. The unscrupulous vendor by the simple process of putting fewer potatoes in a bag can undersell the honest vendor. That is the reason the vendors desire to standardize the amount sold by regulating the quantity by weight instead of measure. Naturally the consumer has a much greater reason for desiring the same system to be in vogue. Purchasers of fruit are well acquainted with the strawberry basket which has a round bottom about an inch thick, a row of fine fruit on the top and a filling of ignoble, sand covered, half ripe fruit underneath. The same applies to eggs. When this delectable fruit is five cents apiece the consumer expects to receive five cents worth of egg, when, as a matter of fact, at this season of the year eggs are so small that it would require about eighteen to weigh as much as a full sized dozen. Even the hens seem to find the cost of living so high that they cannot afford to furnish the fine, large spheroid of better days.

For the protection of the public a law should be passed standardizing the weight of such articles of food as can be more equitably measured by weight than bulk, and provision made for enforcing the law. From the enquiries made the existing regulations in that respect are practically a dead letter even in their present antiquated form, and there is no provision made for carrying them into effect. The new Federal government could not enact a more generally popular measure than such an act that would protect alike the consumer and the honest vendor.—Exchange.

Do you know that more real danger lurks in a common cold than in any other of the minor ailments? The safe way is to take Chamberlain's Cough Remedy, a thoroughly reliable preparation, and rid yourself of the cold as quickly as possible. This remedy is for sale by all dealers.

PEERLESS PERFECTION

The first cost should be the last cost.

You should put up a fence that will give you real fence service first, last and all the time. The cheapest is always the most expensive in the long run on account of repairs necessary.

Peerless Saves Expense

because it is the poultry fence that never needs repairs.

Peerless poultry fencing is made of the best steel fence wire—tough, elastic and springy—and will not snap or break under sudden shocks or quick atmospheric changes. Our method of galvanizing positively prevents rust and will not flake, peel or chip off. This feature alone adds many years to the life of a fence.

The joints are securely held with the "Peerless Lock" which will withstand all sudden shocks and strains yet is so constructed that Peerless Poultry Fence can be erected on the most hilly and uneven ground without buckling, snapping or kinking.

The heavy stay wires we use make Peerless Poultry fencing rigid and upstanding thereby preventing sagging and needs only about half as many posts as other fences.

We build our poultry fence stronger than seems necessary in order to keep marauding animals out and close enough to keep the smallest fowls in. Many of our customers are using this style as a general purpose fence with entire satisfaction.

Peerless Poultry Fence when once put up is always up and will look better, wear better and serve you better than any other fence built.

Our Catalogs are all Free to You

Write us for literature and address of nearest agent. We also manufacture a complete line of general fencing, farm gates, walk gates and ornamental fencing. Agents almost everywhere.

Horse Breeding Legislation.

(Continued from page 295).

for public service must, in every case, prominently advertise the fact that he is a grade, so that everyone easily knows the breeding of the horse. The results of this Legislation have been striking. In 1906, when the first enrollment of stallions was made, 1561 grade stallions were licensed. In 1908, when the licenses were renewed, 553, or 35.2 per cent. of these had been retired from public service and the whole trend has been towards the recognition of the merits of the pure bred stallion. Besides this, the law has lead to more care being taken in regard to the correctness of pedigrees, which has lead to a far better appreciation, on the part of the public, of the whole matter of the breeding of horses.

Very similar legislation now exists in Iowa, Minnesota, Utah, Pennsylvania, New Jersey, Montana, Oregon, Idaho and several other States of the Union. In some of these States the laws are a little less drastic and in others more so. The principal addition which has been made in some States is that relating to a lien which the owner of an enrolled stallion has upon the colt sired by this stallion in case the fee has not been paid. As similar Legislation exists in Manitoba, Saskatchewan and Alberta, we will discuss it more in detail in connection with our statement of tne law in those provinces.

In Manitoba, Saskatchewan and Alberta, legislation has been in force for from 5 to 8 years very similar to the Wisconsin law. One particular in which these western province laws fall short of the Wisconsin law is that, provision is made for issuing certificates for "pure-bred stallions not submitted for examination for soundness and, therefore, not guaranteed." Naturally, the person owning a pure bred stallion, which he knew to be sound, would not submit it for examination and would, therefore, receive such non-guarantee certificate and so would legally travel an unsound stallion. A valuable provision is made in the laws of all of these Canadian provinces, to the effect that the owner of any stallion holding a Government certificate of enrollment may file in the Register of Deeds office, or other office for the purpose, a statutory declaration in regard to the amount of service fee due and shall, consequently, have a lien for the amount of service fee together with costs, which can be collected from the proceeds of a forced sale of the colts. I am advised that in all of these provinces it is purposed to pass more stringent legislation, especially in reference to unsoundnesses.

In Ontario in 1911, a bill was submitted to the legislature to the effect that all stallions kept for public service must be enrolled. Provision was made for enrollment into four classes:

1st.—Pure bred.

2nd.—Pure bred with malformation or disease (malformation or disease to be named).

3rd.—Grade or Cross bred.

4th.—Grade or Cross bred with malformation or disease (malformation or disease to be named).

It will be noticed that the proposed Ontario act differed from the Wisconsin act in that in the latter it was made illegal to travel an unsound stallion; whereas, the Ontario act permitted all stallions to stand for service, with the provision, however, that whatever unsoundness, etc. they might have should be publicly advertised.

After the bill was introduced changes were made, owing to a strong opposition to the clauses in regard to unsoundness, but even with these clauses excluded the bill did not pass for it still met the opposition of those who were opposed to legislation of any sort and it lost a large measure of the support of the leading breeders of tne country owing to its incomplete character.

From the foregoing resume, it will be seen that legislation for the control of stallions has come into force in a number of States of the Union and Provinces of Canada. Wherever such legislation has been passed, new clauses have from year to year been introduced, making the legislation more and more effective. Enthusiastic horsemen look forward to the day when the results of this legislation, coupled with the efforts of private enterprise, will lead to pure bred sires, free from hereditary unsoundness, becoming the only monarchs of horsedom.

Should such Horse Legislation be passed in Nova Scotia?

A Sign of the Times

PEOPLE are becoming very careful about what they eat and drink—

The preference for goods in **sealed** packages —especially in food stuffs—**is now quite definite** and becoming more so every day.

We must frankly admit that there are **sound** reasons for this preference. Food stuffs **cannot** be exposed to varying atmospheric conditions without **losing** both strength and flavor.

Tea—of all articles of everyday diet (excepting coffee, perhaps) needs protection most, and best merchants have been quick to appreciate the fact. So much is this the case that the selling of loose Tea in bulk will soon be a thing of the past.

RED ROSE TEA reaches you with all its virginal flavor, strength and purity—

—It is sealed in air-tight packages—dust and damp-proof—

RED ROSE is a blend of the best Indian and Ceylon Teas.

—The former assures generous strength and richness—the latter **that** coaxing, delicate flavor, Qualities for which Red Rose Tea is famed.

Ask your Grocer for the 40c. package of Red Rose and you'll get **better** Tea—Tea that spends farther—for the same money.

You want "Good" Tea—well,

"Red Rose Tea is Good Tea"

If Pays to Plant Selected Seed.

In 1910 Mr. C. Fred Fawcett, Pioneer Farm, Upper Sackville, N. B., planted one whole selected Green Mountain potato in a hill and from it harvested 31 potatoes, 27 of which were marketable. Total weight 8 pounds, 14 ounces. The best potato from this hill was planted whole in 1911 and the above cut is a photo of the result, 34 potatoes, 28 of which were marketable. Total weight 11 1-2 pounds.

When we visited Pioneer Farm in June 1910 we saw Mr. Fawcett's selected seed plot and although it had been planted on the same date as the general crop in the same field, the contrast in tops was very much in favor of the selected plot, which showed a height of stems and volume of leaves fully double that of the general crop plants.

See Mr. Fawcett's article on other pages of this issue. Can any other farms in Canada beat this record?

Liquid Rennet.

W. A. Smith, Char. Co., N. B.:—Can you give me the address of any firm who deals in Liquid Rennet? Where can I obtain Irish Cobbler and Green Mountain Seed Potatoes?

Ans.:—If subscriber has access to a cheese factory a satisfactory and cheap supply can likely be obtained. Such an arrangement would permit of small quantities being secured. Liquid Rennet is not usually sold by dealers in less quantity than one gallon.

It can be obtained of Hunter White, St. John, N. B. or Maritime Dairy Co., Sussex, N. B. Hansen is a good brand.

C. Fred Fawcett, Upper Sackville, N. B. and Clements & Co., St. John, N. B. are offering Irish Cobbler and Green Mountain Seed Potatoes for sale.

Hay and Straw.

Hay on the city scales is worth $23 per ton in Toronto this week. By the carload there is no change. The American hay markets have advanced during the past week, as receipts have been greatly reduced, leading to an acute scarcity at some points. More hay is now in transit, and a good deal ready to load as soon as roads are open for shipment. Much weather damaged hay is finding its way on the British markets, and it is hard to get rid of. Canadian hay arrivals are still small and this helps to support prices.

In Montreal hay is ranging in price from $10 to $16 in car lots, according to quality. $13 to $17.50 per ton, in car lots are the selling hay prices in Toronto.

WIN A PRIZE

GIVEN AWAY

And many other Prizes according to the simple Conditions of the Contest (which will be sent).

Each one of the above four lines of figures spells a word. This most interesting puzzle can be solved with a little study, as follows: There are twenty-six letters in the alphabet, and we have used figures in spelling the four words instead of letters. Letter A is number 1, B number 2, C number 3, etc., throughout the alphabet.

USE YOUR BRAINS. Try and make out the four words. **ACT QUICKLY.** This is a chance for clever persons to win Cash and other Prizes with a little effort. Write the four words, with your name and address, neatly on a piece of paper or post card and mail to us, and we will write you at once, telling you all about it. You may win a valuable prize. **Act Promptly.**

Breeding Hopples.

Information is thus sought by J. S., Mill Grove:

"What kind of cheap but serviceable and reliable hopples would you recommend for mares at breeding time? My neighbor had a $1,000 stallion kicked and probably ruined. I thought I could manage any mare so she would not kick, but this season I found two that did kick in spite of all I could do."

The usual form of hopples has a heavy leather neckband about the size of a collar and made about as heavy as a work harness trace. This may be either a continuous loop to slip on over the head, or it may be made with a buckle so as to be adjustable to size. Heavy double leather bands are also made to buckle tightly around eacn hind pastern, and these are sometimes lined witn sheepskin with the wool on to prevent chafing. Each pastern band has a ring sewed in and a rope extends from the ring in one up between the fore legs to the neckband and back to the ring in the other pastern band. The rope should be not less than ¾ inch in diameter and adjusted so as to be snug when a mare stands naturally. Some men dispense with the neckband and merely tie a loop of the same size in the middle of the rope, using the ends to extend to the hind pasterns. In an emergency a rope alone may be used in this way by tying each end to a hind pastern by double half-hitches, but the straps to buckle around the pasterns can be more safely and quickly put on strange mares and are more secure.—Breeders Gazette.

Beauty and Fertility.

"That same instinct and culture which lead men of means to pay thousands of dollars for a beautiful painting, also induce them to invest liberally in beauty of animal form. Jacob's ring-streaked and speckled cattle may have been useful, but they were not beautiful in that day, nor would they be appreciated in this day. 'Handsome is as handsome does' may cover a multitude of faults, but it loses much money to the breeder of pedigree stock who orders his matings according to its philosophy. A hammer-headed, gabled-rumped, three-cornered cow does not give milk by reason of these deformities, but in spite of them. A man should not desire a three-corned cow any more than a three teated udder. There is something lacking—something of tangible value missing. Beauty is more than skin-deep in a pedigree animal. It is pocket-book deep. The man who reads the history of the trade and fails to find that fact is blind, as it looms large on every page. It is possible to combine beauty of form with excellence of function in the dairy cow, and the combination rates high in financial value. The breeder who neglects either factor in the equation is like the man who undertakes to row a straight course with one oar. A wide appreciative market awaits breeders who combine attractiveness of form and finish with profitable production. Until a love of the esthetic is eliminated from the human mind, shapeliness and finish in the dairy cow may be minted into money."—W. R. Goodwin.

St. John Prices.

GRAIN—Oats, 55c. to 58c. bushel; Buckwheat, $2.50 to $3.00 cwt.

FEEDSTUFFS—Bran, $21.00 ton.

HORSES—Drafters, $225 to $250; Roadsters, $175 to $200; Carriage, $175 to $200.

DAIRY PRODUCTS—Creamery Butter, 30c. to 33c.; Dairy Butter, 25c. to 28c.; Cheese, 13c. to 14c.

TAKE THIS BELT

AND BECOME

A MAN

All men cannot be MILLIONAIRES, but thousands of them could be much better off FINANCIALLY, SOCIALLY and in every other respect if they would guard their health. With VIGOROUS HEALTH—a body full of ELECTRICAL ENERGY—a man can make OPPORTUNITIES if he don't find them, but lacking in the COURAGE and SELF-ASSURANCE that is born of MANLY VIGOR, he is but a derelict—a vessel without mast or rudder—cast hither and thither by every storm of life that besets his pathway. GIVE ME A MAN that has exhausted his VITALITY—suffering from PAINS AND ACHES—MENTAL DEPRESSION —SLEEPLESSNESS—NERVOUS DEBILITY—without HOPE—AMBITION — COURAGE gone — drifting with the tide—and I can transform him into a STRONG MAN—A man of push—a man that will make his way in spite of all obstacles—if he has anything left to build upon, and he will follow my advice and use the DR. McLAUGHLIN ELECTRIC BELT as I direct. Save your tobacco money for a few weeks—cut out a few of your health-destroying, soul-destroying habits—procure one of these appliances—USE ELECTRICITY, and use it in the right way to invigorate your body, and you will look upon the day you gave your case to me as the TURNING POINT OF YOUR LIFE. Here is what some say of this remedy, who have used it:

Dear Sir,—I am perfectly satisfied with your Belt for what it has done for me. I am now a well man.

Yours, very truly,
HUGH McLEAN.
New Glasgow, N.S., Box 464.

Dear Sir,—I find your Belt all right for every kind of pain that is felt in the human body, and I have not missed a day with sickness since I got the Belt.

Yours very truly,
JAS. W. BARRIE.
Auld's Cove, N.S.

Dear Sir:—

Having received a Belt from you some years ago, I now desire to express myself in regard to the benefits, which I received from it. I wish to say in as few words as possible that it was all that it was represented to be, having cured me of Indigestion and other ailments, and I must say that I feel a new man, and I give all credit to Dr. McLaughlin's Electric Belt. I would advise any one suffering to give the Belt a trial, and I know they will feel as I do. Although I have been four years benefited without saying so to you, I have been doing all I could in my locality personally. So giving you the privilege of using this letter as you wish, and wishing your Belt every success, I remain,

Sincerely yours,
SAM J. HARNETT.
North Gower, Ont.

Any man or woman who will give me reasonable security, I will send them the Belt, with all the necessary attachments suitable for their case, and they can

PAY WHEN CURED

Never mind waiting until you use the last dose of that bottle from the drug store. Begin now. Call and talk your case over with me or send for my book. It costs you nothing. For over 24 years I have taught the great truth that "ELECTRICITY IS LIFE," and have proved the soundness of my doctrine by making cures when others have failed time and again. Others have aspired to do the work I am doing with my ELECTRIC BELT. They offer you Electricity in some other form, or an "electric belt" that possesses no curative power whatever. They are like "boys on bladders" floundering in a sea of uncertainty—while to-day the DR. McLAUGHLIN ELECTRIC BELT stands the world over as the most correct—the most perfect—method of applying Galvanic Electricity to the body that has ever been devised. Call at once or send coupon for our FREE illustrated 80-page book, from which you can learn much that you want to know. Do it now.

M. K McLAUGHLIN

214 St. James St., Montreal, Can.
Dear Sir,—Please forward me one of your books as advertised.

Name .....

Address .....

Office Hours—9 a.m. to 6 p.m.; Wednesday and Saturday till 8.30 p.m.

POULTRY AND POULTRY PRODUCTS—Eggs, 25c. to 28c., fresh, 35c.; Fowl, $1.30 to $1.65 and $2.00; Chickens, $1.30 to $1.75; Ducks, $1.75; Geese, $1.50 to $1.75; Turkeys, 25c. to 32c. pound.

FRUIT—Apples, $2.25 to $3.00.

MISCELLANEOUS—Hay, $12.00 to $15.00 ton; Straw, $8.00; Wool, 18c. to 23c.; Beef Hides, 11½c.; Calf Skins, 16c.; Sheep Skins, 80c. to $1.00; Lamb Skins, 80c. to $1.00.

VEGETABLES—Carrots, $1.50 bbl.; Potatoes, $2.25 to $3.00; Turnips, $1.00; Beets, $1.25 to $1.40.

The market is very well supplied with meats of all kinds. Mutton and veal if it is good quality will bring good prices. Of late the farmers have been sending poor stock to market. They have to sell at a low price while the Western firms are demanding good prices for their stock. Swift Co. and Gunn Co. are selling 100 to 125 carcasses of Western Beef in the City. My advice to the farmers of New Brunswick is to get up and take a hustle on for the day is not far distant when the Western Beef will have full control. Potatoes are advancing in price and they will go higher. Good veal is bringing good prices. Butter is in good demand prices 25c. to 33c. and the farmers are asking 35c. for up-to-date goods in the market to-day.—W. C. D.

Halifax Prices.

GRAIN—Oats, 56c. to 57c. per bus; Peas, Round, $5.50 to $5.75 per bbl.

FEEDSTUFFS—Bran, $27.00 to $27.50 per ton; Shorts, $28.50 to $29.00 per ton; Middlings, $29.00 to $29.50 per ton; Oil-cake Meal, $2.40 to $2.45 per 100 lbs.; Cottonseed Meal, $1.80 to $1.85 per 100 lbs.; Gluten Meal, $1.65 to $1.70 per 100 lbs.; Corn Meal, $1.72½ to $1.77½ per bag.

GRASS SEEDS—Timothy, 18½c. to 19½c. pound; Com. Red Clover, 23c. to 24c. pound; Mam. Red Clover, 23c. to 24c. pound; Alsike, 20c. to 21c. pound.

LIVE STOCK—Milch Cows, $40.00 to $50.00.

DRESSED MEATS—Beef (retail), 16c. to 20c. lb; Mutton, 9c. to 9½c.; Veal, 8c. to 8½c.; Pork, 12c. to 15c.

HORSES—Drafters, $250.00 to $300.00; Roadsters, $275.00 to $300.00; Carriage, $275.00 to .$300.00.

DAIRY PRODUCTS—Creamery Butter, 32c. to 34c. lb.; Dairy Butter, 25c. to 27c. lb.; Cheese, 15c. to 15½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 35c. to 40c. doz.; Fowl 20c. to 22c. lb.; Chickens, 19c. to 20c. lb.; Ducks, 20c. to 21c. lb.; Geese, 19c.. to 20c. lb.; Turkeys, 25c. to 26c. lb.

FRUIT—Apples, $2.50 to $3.50 bbl.

MISCELLANEOUS—Hay, $13.50 to $14.50 ton; Straw, $8.00 to $9.00 ton; Beef Hides, 11c. to 11½c.; Calf Skins, 15c. to 16c.; Sheep Skins, 80c. to 90c.; Lamb Skins, 80c. to 90c.

VEGETABLES—Potatoes, 80c. to 85c. bus.; Turnips, 40c. to 50c. bus.

WHY MAN OF TODAY IS ONLY 50 PER CENT. EFFICIENT

By Walter Walgrove.

If one were to form an opinion from the number of helpful, inspiring and informing articles one sees in the public press and magazines, the purpose of which is to increase our efficiency, he must believe that the entire American Nation is striving for such an end—

And this is so.

The American Man because the race is swifter every day: competition is keener and the stronger the man the greater his capacity to win. The stronger the man the stronger his will and brain, and the greater his ability to match wits and win. The greater his confidence in himself, the greater the confidence of other people in him: the keener his wit and the clearer his brain.

The American Woman because she must be competent to rear and manage the family and home, and take all the thought and responsibility from the shoulders of the man, whose present-day business burdens are all that he can carry.

Now what are we doing to secure that efficiency? Much mentally, some of us much physically, but what is the trouble?

We are not really efficient more than half the time. Half the time blue and worried—all the time nervous—some of the time really incapacitated by illness.

There is a reason for this—a practical reason, one that has been known to physicians for quite a period and will be known to the entire World ere long.

That reason is that the human system does not, and will not, rid itself of all the waste which it accumulates under our present mode of living. No matter how regular we are, the food we eat and the sedentary lives we live (even though we do get some exercise) make it impossible; just as impossible as it is for the grate of a stove to rid itself of clinkers.

And the waste does to us exactly what the clinkers do to the stove; make the fire burn low and inefficiently until enough clinkers have accumulated and then prevent its burning at all.

It has been our habit, after this waste has reduced our efficiency about 75 per cent., to drug ourselves; or after we have become 100 per cent. inefficient through illness, to still further attempt to rid ourselves of it in the same way—by drugging.

If a clock is not cleaned once in a while it clogs up and stops; the same way with an engine because of the residue which it, itself, accumulates. To clean the clock, you would not put acid on the parts, though you could probably find one that would do the work, nor to clean the engine would you force a cleaner through it that would injure its parts; yet that is the process you employ when you drug the system to rid it of waste.

You would clean your clock and engine with a harmless cleanser that Nature has provided, and you can do exactly the same for yourself as I will demonstrate before I conclude.

The reason that a physician's first step in illness is to purge the system is that no medicine can take effect nor can the system work properly while the colon (large intestine) is clogged up. If the colon were not clogged up the chances are 10 to 1 that you would not have been ill at all.

It may take some time for the clogging process to reach the stage where it produces real illness, but, no matter how long it takes, while it is going on the functions are not working so as to keep us up to "concert pitch." Our livers are sluggish, we are dull and heavy—slight or severe headaches come on—our sleep does not rest us—in short, we are about 50 per cent. efficient.

And if this condition progresses to where real illness develops, it is impossible to tell what form that illness will take, because—

...The blood is constantly circulating through the colon and, taking up by absorption the poisons in the waste which it contains, it distributes them throughout the system and weakens it so that we are subject to whatever disease is most prevalent.

The nature of the illness depends on our own little weaknesses and what we are the least able to resist.

These facts are all scientifically correct in every particular, and it has often surprised me that they are not more generally known and appreciated. All we have to do is to consider the treatment that we have received in illness to realize fully how it developed and the methods used to remove it.

So you see that not only is accumulated waste directly and constantly pulling down our efficiency by making our blood poor and our intellect dull—our spirits low and our ambitions weak, but it is responsible through its weakening and infecting processes for a list of illnesses that if catalogued here would seem almost unbelievable.

It is the direct and immediate cause of that very expensive and dangerous complaint—appendicitis.

If we can successfully eliminate the waste all our functions work properly and in accord—there are no poisons being taken up by the blood, so it is pure and imparts strength to every part of the body instead af weakness—there is nothing to clog up the system and make us bilious, dull and nervously fearful.

With everything working in perfect accord and without obstruction, our brains are clear, our entire physical being is competent to respond quickly to every requirement and we are 100 per cent. efficient.

Now this waste that I speak of cannot be thoroughly removed by drugs, but even if it could the effect of these drugs on the functions is very unnatural, and if continued becomes a periodical necessity.

Note the opinions on drugging of two most eminent physicians-

Prof. Alonzo Clark, M.D., of the New York College af Physicians and Surgeons, says: "All of our curative agents are poisons, and, as a consequence, every dose diminishes the patient's vitality."

Prof. Joseph M. Smith, M.D., of the same school, says: "All medicines which enter the circulation poison the blood in the same manner as do the poisons that produce disease."

Now, the internal organism can be kept as sweet and pure and clean as the external and by the same natural, sane method—bathing. By the proper system warm water can be introduced so that the colon is perfectly cleansed and kept pure.

There is no violence in this process—it seems to be just as normal and natural as washing one's hands.

Physicians are taking it up more widely and generally every day, and it seems as though everyone should be informed thoroughly on a practice which, though so rational and simple, is revolutionary in its accomplishments.

This is rather a delicate subject to write of exhaustively in the public press, but Chas. A. Tyrrell, M.D., has prepared an interesting treatise on "The What, The Why, The Way" of the Internal Bath, which he will send without cost to anyone addressing him at 275 College St., Toronto, and mentioning that they have read this article in The Maritime Farmer.

Personally, I am enthusiastic on Internal Bathing because I have seen what it has done in illness as well as in health, and I believe that every person who wishes to keep in as near a perfect condition as is humanly possible should at least be informed on this subject; he will also probably learn something about himself which he has never known through reading the little book to which I refer.

Symptoms, Treatment and Prevention of Scratches.

The time is not long to the season when mud and slush will prevail. In such a time the horses' legs need careful attention to keep them free from scratches, grease, or mud fever, as the disease is variously called. In a western exchange we und the following excellent treatment ror the disease:

NATURE OF SCRATCHES.

This is distinctly a disease caused by continued exposure to mud or slush, especially when precautions are lacking to keep the legs clean. In occasional instances the disease may arise from keeping horses standing in nithy stables. The long continued contact with mud or moisture may so saturate the long hair on the legs, half way or more up the cannon bone from the hoof, that the skin is not dry or clean for many consecutive days. Soon an inflammation begins that causes the disease known by the various names already mentioned. Some horses are more susceptible than others, depending on the nature of their skin, the amount or length of hair, and such other characteristics as constitute the individuality of any particular animal.

SYMPTOMS.

When scratches begin to make their appearance, the owner will first notice small patches of hair matted with a slight watery discnarge. These patches vary in size from a pinhead to a pea, and under them the skin is slightly elevated and tender. Soon these areas enlarge in diameter and thickness and the discharge becomes thicker and more profuse. As the disease advances, the skin becomes painful to touch or when the horse moves. A still more copious discnarge follows, the hair falls on and the skin becomes covered with a thick layer of greasy-looking matter. In severe cases the disease may extend as far as the knee or hock joint. The leg sometimes assumes a much enlarged condition, which may become permanent.

TREATMENT.

This is both simple and inexpensive, and if begun in time is usually followed by early recovery. Until healing has made a good start, keep the horse out of mud or slush. Soften and remove the scabs and crusts by the repeated application of poultices of linseed meal. Then the application of a lotion composed of zinc sulphate and lead acetate, six drams of each in a pint of water, will prove very beneficial. All crusts and matted hair may be kept off by washing with castile soap and warm water. Dry throughly after washing before applying the lotion. A little carbolized vaseline applied occasionally will overcome any tendency of the skin to become dry or crack. It will also protect from wet if the horse must be driven in mud before complete recovery. Good feed of a laxative nature will serve as a valuable adjunct to the above treatment.

PREVENTION.

As already stated, scratches yield readily to the above treatment, providing it is begun early. The disease is, however, easily guarded against and prevented by observing strict cleanliness. This can be done by careful cleaning. Long hair should be allowed to dry completely after every drive. If it cannot occur readily without, the hair may be clipped to such a length that it may occur rapidly. Should fumes from continuous standing in manure be the cause, the remedy is easily applied. This cleanliness will also add to the comfort and working efficiency of the animal, so it is doubly worth while.

Community Breeding.

WHY?

"1st—Community breeding should be established to elevate the standard of (a) interest—a breeder's interest is always increased when his neighbors and townsmen are engaged with him in the same line of work, thereby affording an opportunity for measuring progress; (b) improved methods, increased interest, and easy means of making comparison is invariably followed by improved methods; (c) uniformity of type. Frequent conferences with other men engaged in raising the same breed of stock will lead farmers gradually to think and to act along the same lines. Appreciation of what others are doing, of stock they are breeding, will lead to exchange of stock, and consequently to a more general breeding along the same lines, and these conditions will bring about greater uniformity of type.

"2nd—Community breeding will establish a reputation for increased interest, improved methods, and uniformity of type, will produce better stock, enhance values, increase numbers, establish a reputation and attract prospective purchasers.

VALUE TO THE INDIVIDUAL.

"1st. Improved stock are close at hand from which to select.

"2nd. A great stimulus is caused by the enthusiasm of others. A man's ambition to excel is aroused and he is more likely to set out on a comprehensive plan of stock improvement.

"3rd. Opportunities for co-operation in the buying, selling, and exchanging of stock are enlarged.

"4th. Value of stock is increased.

VALUE TO THE COMMUNITY.

"1st. Reputation of a community as a distributing center is established.

"2nd. Opportunities for profitable sale of live stock are multiplied and the community at once gains a valuable asset.

HOW ESTABLISHED.

"Several plans, separate and distinct in their organization, have been put in successful operation:

1st plan. The first plan we will outline includes the organization of an association, the co-operative ownership and use of pure-bred bulls, and financial assistance from the government.

"2nd plan. The second plan involves the organization of an association and incorporation of the same; its division into groups based upon the number of cows owned by the members; the purchase of one pure-bred bull for each group, and the exchange of bulls at the close of each two-year period from one group in the association to another group in the same association.

"3rd plan. In the third plan an association is formed for the purpose of promoting a particular breed of stock, and each member pledges himself to use only a pure-bred bull of the particular breed adopted by the association.

"This plan admits of the ownership of pure-bred males, either individually or co-operatively, and is the general plan thus far adapted by the associations already organized in Maine, of which there are six. Plans are now being formulated to stimulate the interest in associated work along these lines to increase the number and to organize more definitely the constructive work of our associations.—Maine Farmer.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

In Utility we won most and best of the prizes. We offer for sale excellent specimens in both young and old stock.

CRAIG BROS., Amherst, N. S.

Advertise in The Maritime Farmer

Charlottetown Price List.

Since our last report there has been very little change in price of farm produce. Pork is high, but owing mostly to limited supply offered as packers do not want it at the advance, and if supply should be more than sufficient for local demand and small orders, prices would likely drop back ½ or ½c. but just at present there does not seem mucn prospect of increased supply so that price may hold. Butter is scarcer and price higher and further advance may take place. Oats are in very limited supply and we look for further advance for local use. There is very little oats in store here. Potatoes are offered in very small quantities and no other vegetables are offering at all. The local demand being supplied from stock held by retailers and at retail prices. Hay has been offered more freely and prices are easier but not much lower. Eggs are very scarce in fact there is nothing doing in them except in retail way. Beef is plentiful but quality very inferior and the price has a wide range according to quality. Good beef is sought after at good prices, but the light thin stuff is hard to sell. Cheese is out of the market except a very limited quantity in the hands of the wholesale grocers this is being sold to the retailers at about 15c.

GRAIN—Oats, white, 46c. to 47c.; black, 48c. to 50c.

FEEDSTUFFS—Bran, $1.40 to $1.45 Shorts, $1.45 to $1.50; Middlings, $1.50; Oil-cake, $2.50; Corn Meal, $1.85.

LIVE STOCK—Butcher's Cattle, 3¾c. to 5¾c.; Stockers, $18 to $35; Milch Cows, $25 to $40; Sheep, 3c. to 3½c.

DRESSED MEATS—Beef, (carcass), 6½c. to 8½c.; Beef, (retail), 8c. to 14c.; Mutton, (carcass), 7c. to 8c.; Pork, light, 6½c. to 7¾c.; select, 7¾c. to 8c.; heavy, 6¾c. to 7½c.

HORSES—Drafters, $125 to $225; Roadsters, $150 to $225; Carriage, $150to $225.

DAIRY PRODUCTS—Creamery Butter, 27c. to 38c.; Dairy Butter, 22c. to 25c.; Cheese, 15c.

POULTRY AND POULTRY PRODUCTS—Eggs, 25c. to 26c.; Fowl, 8c. to 10c.; Chickens, 10c. to 14c.

FRUIT—Apples, $1.50 to $3.50 bbl.

MISCELLANEOUS—Hay, loose, 70c to 73c.; pressed, $12 to $13; Straw, $6; Wool, 25c.; Beef Hides, 10c.; Sheep Skins, 65c. to 90c.; Lamb Skins, 60c. to 90c.

VEGETABLES—Potatoes, 38c. to 40c. Turnips, 16c. to 20c.

Dates to be Remembered

Halifax Exhibition, September 11—19, 1912.

N. B. Provincial Seed Fair, Fredericton, March 21 and 22, 1912.

"WILLOW FARM" FOR SALE.

"Willow Farm" is situated two miles from the centre of the town of Amherst, which is a growing manufacturing town of over nine thousand population, and one of the best markets in Canada. There is a good public school within forty rods of the house.

The farm consists of one hundred and twenty three acres, forty three acres of marsh and eighty of upland, sixty five of which are under circulation.

The upland is in a high state of cultivation as a large stock of cattle have always been kept on the place and for several years a short rotation has been followed. The soil varies some but is mostly a good loam quite free from stone and easily worked. The pastures are well watered by springs and brooks.

The house is 28x38 feet, two stories with ell 16x20 with good cellar, heated by furnace. Barn 50x80 feet with basement stable which will accomodate forty cattle and six horses, also root cellar holding two thousand bushels. Carriage and impliment shed 26x36 feet and other out buildings all in first-class repair.

The fencing is nearly all of woven wire and in good order,

A wood lot of 70 acres, three miles from the farm will be included in the sale.

A retail milk trade of about one hnndred and twenty quarts a day will be sold with the farm if desired.

This is one of the finest live stock and dairy farms in Cumberland County; a beautiful home and a splendid opportunity for the right man. Apply to

C. HOWARD BLACK, Owner,
Amherst, Nova Scotia.

Shubenacadie, N. S.

WE WANT TO TELL YOU HOW YOUR COMMUNITY CAN OPERATE A SUCCESSFUL TELEPHONE SYSTEM OF ITS OWN

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada

THE number of rural telephone lines started during the last year has been greater than ever before in the history of Canada. If, indeed, it has not been started already, your own community is bound to have a telephone system, sooner or later. You would have such a system at once, if you and your neighbors only realized how quickly, easily and inexpensively it could be put into operation. You, yourself, can start this system going right away; with the help we offer, you can interest your friends and neighbors and, among you, can organize your own company, erect your own line, install your own instruments, and operate your own self-maintaining telephone system, just as successfully as the largest telephone exchange is operated in the largest city on the continent.

This Bound Volume of 100 Illustrated Pages is FREE

NEVER, since farmers first started installing their own telephone instruments, has there been produced so comprehensive a volume of instructions as our book "How to Build Rural Telephone Lines." This book, printed on good paper, illustrated with photographs and diagrams and bound in stiff, cloth covers, is an invaluable text-book on the subject of constructing telephone lines in the rural districts. Written in plain language by expert telephone engineers, it has been a very costly book to produce. It is really almost too valuable to give away free; we could not afford to distribute it haphazard. However, we have one copy for you.

BUT We Send It Only When You Ask For It

"How to Build Rural Telephone Lines" tells about what other rural telephone companies have done, about company organization, about constructing the line, about installing the instruments, about the materials required, about the instruments themselves, and also even gives the law in regard to wires crossing railways, etc. Chapter after chapter, it goes into each item in detail. Nowhere else are the facts so concisely set forth as they are in this book.

Province.....

Montreal

You Can Organize Your Own Company

YOU don't need to know anything about company organization to start a company among your own friends and neighbors. Our book tells all about both mutual and stock companies and shows you, step by step, just exactly how to go about the matter. It shows you how the procedure differs in the various provinces, what the different governments demand of you and what they will do to help you.

You Can Build Every Foot of Your Own Line

NO expert lineman or superintendent of telephone construction is necessary to build the efficient line that you can put up yourself by merely following the detailed instructions given in this book. Any man who can read and who will follow directions with ordinary sense can build his own telephone line. With the instructions that you can give your neighbors after you have read this book, they can erect every pole, place every cross-arm, string every foot of wire and install every instrument. You can easily realize how this means economical construction.

We Will Guide You In Every Step of Organization and Construction

WE are the largest manufacturers of telephones in the Dominion of Canada. Nine out of every ten telephones in use in the country to-day have been made in our plant. You can readily understand, therefore, that our experts are the master-minds of telephone construction in the Dominion. It's the knowledge of these men that we place at your disposal—it's their expert advice that will guide you in every step.

Let Us Show You How To Get The Movement Started

FARMERS throughout the country are just beginning to realize that they can have telephone connection as well as if they lived in the city. They are tremendously interested in the subject. Most of them have been reading it up in their farm papers. It is only necessary for some one man to come forward with definite knowledge on the subject and say: "Let's get started!" With the information that our book will give you, you can be the man in control of the situation in your community.

Now Is The Time For You To Act—Before Someone Else Does It

WRITE in to us and get this book at once. A self-maintaining telephone system will eventually be started in your community. If the moment is not ripe, the time is fast approaching when it will be, and you owe it to yourself to be informed on the subject. If you want the book send us the coupon.

Why Asepto Products Sell

Because every article carries with it a Premium Coupon.

Not the old time worn premium that was given with a pound of tea.
The Premiums we give will satisfy the most exacting buyer.
We have many, many beautiful and valuable articles to give you.

In fact we can help you to furnish your home.
Remember this, you pay less for superior products than for other makes.
Here are some of the articles that carry Asepto Soap Coupons.

Asepto Soaps

Asepto Soap

Have Your Barn Right Inside

If you are Building or Remodelling your Dairy Barn make sure that you get the best results in Interior arrangement for the comfort and health of your Cows as well as for your own convenience and profit. Our new catalogue on stable equipment is just published. The new features described in it mark another long step towards perfection in comfort and cleanliness for the Cows, convenience and time saving in the stable work, and increased profits for the owner.

Good Equipment Pays.

You dairymen who want increased profits from your milk production should look more to the arrangement and equipment of your barns.

The inside of your barn is of vital importance. Through the equipment alone, you may gain or lose hundreds and even thousands of dollars every year.

Dairy farming is like any manufacturing business. Your farm and stock represent your plant. As in any other business, one of the most important means of increasing profits is the cutting down of expenses. In dairy farming, this may be accomplished by correctly planning the barn, together with the use of BT Sanitary Barn Equipment.

Correct planning of your barn, and the proper arrangement inside, will enable you to handle and store your feed more easily. It will enable you to care for more cows in the same sized barn. It will save you and your men time and labour every day, by cutting in half the work in feeding and watering stock, in cleaning the stable and in doing other barn work. It will help you protect your stock against disease, worry and accident, and many other advantages will be brought to light when you investigate every feature carefully.

Cows which are healthy and comfortable give bigger returns.

Exclusive Features on BT Stalls.

There are five exclusive patented features on BT Sanitary Stalls. Here they are:

THE RAISE AND LOWER MANGER—(See cuts below.) Cuts the work of feeding in two. Makes unnecessary the cost of installing water bowls, and allows individual feeding of your cows.

THE ALIGNMENT DEVICE.—(See fig. 191).—It keeps the cows clean.

THE SURE-STOP DEVICE.—It is impossible with BT Stalls for the cow to put her head anywhere but in the stanchion. See how this is done in our catalogue,

THE DOUBLE CURVE PARTITION protects the cow and milker from injury. It is very much neater in appearance than the single curve partition.

THE BT STANCHION.—It is always chosen when its merits are known. It is hung by a smoothworking swivel connection above, so that it turns more freely and without the noise of a chain hanging stanchion. It is two inches to four inches longer than others, giving more freedom to the cow. See our catalogue and learn the reasons why it is always chosen.

REMEMBER, you can get these six features only ON BT STALLS, as they are patented and used exclusively by us.

The Ideal Stall.

A short perusal of the BT Catalogue will convince any one that the BT STALL IS THE IDEAL STALL.

The saving on feed and [illegible] by adopting the EXCLUSIVE FEATURES ON BT STALLS will pay for the equipment in a year's time.

In addition, the perfect freedom and comfort given the cows and the greater cleanliness made possible, will increase the yield and improve the quality of the milk.

No other investment will pay as big dividends to the dairymen as The BT Barn Equipment.

When you install the BT Barn Equipment you will NOTE MANY OTHER ADVANTAGES AND CONVENIENCES and a greater protection to the cows. You will see how this equipment LESSENS ABORTION, and does away with the PRINCIPAL CAUSES OF BOG SPAVIN, RUPTURE, and many other injuries; you will see how the individual mangers PREVENT OVERFEEDING AND UNDERFEEDING.

Our Catalgoue is FREE, and will give you particulars.

It shows the proper measurements for cemennt mangers the length the cattle stand should be for different beeds of cattle, the best size and shape for the gutter. LET US SEND IT TO YOU.

BT SANITARY BARN EQUIPMENT

With a good cement floor, is practically indestructible. Do not use an old-style construction that will soon rot out, that will mean more work, and will not be as comfortable for the cows. A few years from now you would regret it if you did. Toronto and other cities are now passing stringent milk by-laws governing Dairy Barns. All over the country there is a movement for more sanitary conditions. Now is the time to get your barn right, before some milk commission demands it. The cost of good equipment is not greater when everything is considered.

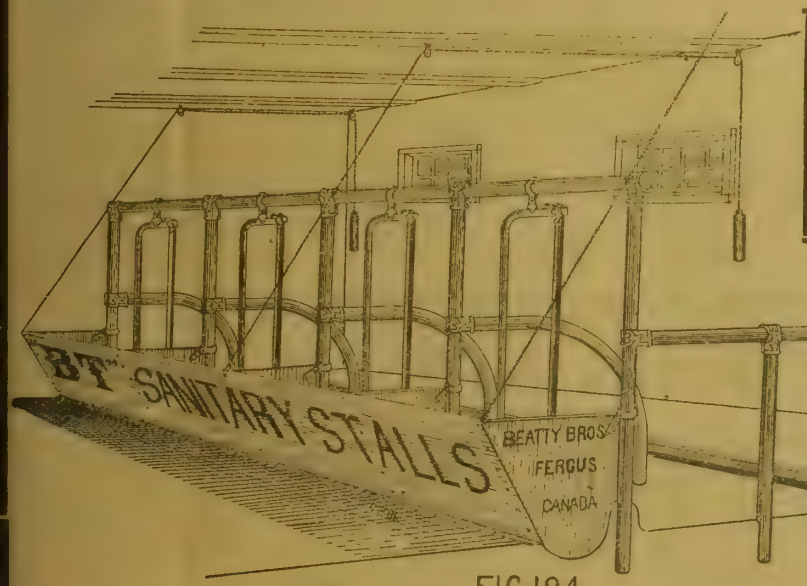

FIG.194

Fig. 194 shows the BT Steel Stalls with manger down ready to feed. Note the capacious manger, with partition between each cow. This manger can be made of either galvanized steel or wood.

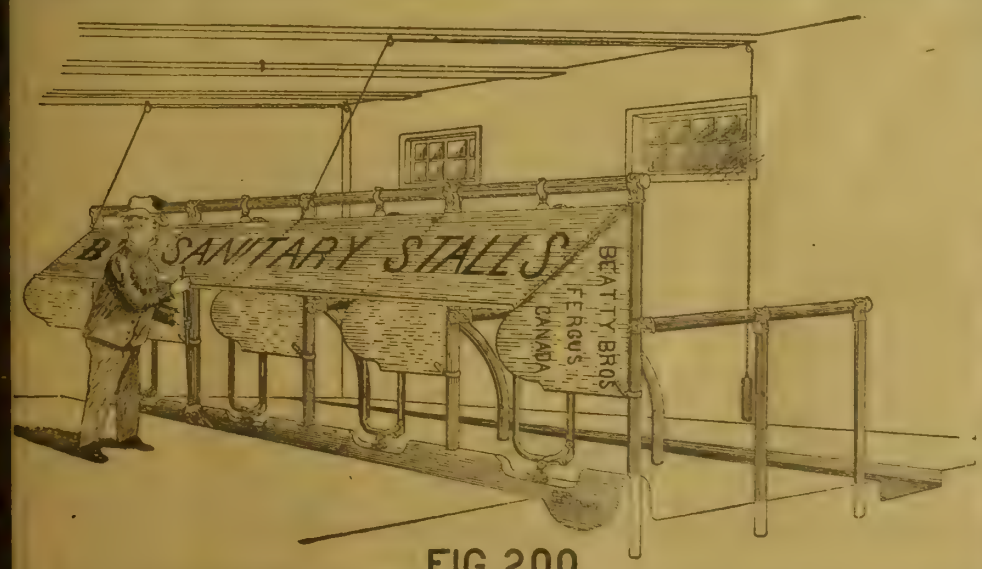

FIG.200

Fig. 200 shows the BT Steel Stalls with manger turned up. Note, the bottom of the manger is the cement floor. It is easy to clean this manger, and you can water right iu the same trough. We furnish the stalls with or without the manger, or we will furnish the stanchion only, to be used with wood frame. Our catalogue describes fully each method of construction.

Get Our Book on Stable Construction.

At a cost of over $2000 we have produced a book on Stable Construction. It tells how to build a barn from start to finish. It shows how the upper structure should be built and how you can save much money over the ordinary methods of framing. It gives the latest and best system of ventilation, which information has been carefully prepared by Prof. J. H. Grisdale, Dominion Agriculturalist. It gives barn plans approved by the best dairy authorities; tells how to lay cement floors properly, gives proper measurements for manger, cattle stand and gutters for any size of barn. The book is free. Get a copy now.

Our Free Barn Plan Service.

With the BT Sanitary Barn Equipment you get something besides the equipment. We give you a service free, for which any competent architect would charge you a large fee.

We know every branch of the farming business and are thoroughly familiar with your requirements in the construcion and arrangement of your barn. Just by an inspection of plans we have frequently suggested changes that resulted in the saving of hundreds of dollars and more, and besides making marked improvements.

We have no stock plans to offer you, but adapt the plan to meet your own specific requirements. If you have a problem to solve put it up to us. We may be able to help you. Our knowledge is at your disposal.

Fig. 191 shows THE BT ALIGNMENT STANCHION. Cows are not all the same length but with the BT Stanchion you can line them all on the gutter, whether they are long or short. It keeps them clean.

Fill out this Coupon and mail it To-day for free Catalogue and information on stable construction.

DE LAVAL
CREAM SEPARATOR

NEW AUTOMATIC OILING

The most important Cream Separator improvement since the introduction of the present type of De Laval machines.

The new automatic oiling De Laval Cream Separators are now being supplied in all sizes, and this improvement constitutes another great step forward in cream separator construction — the one thing possible in betterment of the previous De Laval machines of the present type.

The new system of De Laval automatic oiling is distinctively different from any other splash or spray system in that there is a constant regulated feed of fresh oil and discharge of used oil. Other splash systems use the same oil over and over, until it soon does more harm than good.

In the new automatically oiled De Laval machines all gears, shafts and bearings practically float in a mist-like spray of oil and literally never touch each other during their operation.

De Laval agents will be glad to exhibit the new machines and demonstrate the working of the new automatic oiling system, which more than ever enhances De Laval superiority in every feature of cream separator practicability.

Maritime Wire Fence Stands the Strain

of unexpected accidents, without a flinch. It holds under the most trying conditions. Maritime Wire Fence makes good because Maritime material is first quality, and Maritime workmen excel in their calling.

All Maritime Fence is made from extra heavy smooth No. 9 wire, so thoroughly galvanized that it won't peel. The Maritime lock holds the joints so rigidly that they can't give or pull out of shape. Maritime Fence is rust-proof, accident-proof, and as near wear-proof as man can make it.

Maritime Fence is your kind of fence—made as you would make it yourself—if you could. Maritime Fence is true economy for you. It is made and sold upon honor. Costs no more than inferior fence. Send now for our free fence booklet. Tells you everything you want to know about fences. Write while you are thinking of it. It will pay you,—pay you well.

The Packing of Fruit and Vegetables.

Attractiveness Adds Value.

By E.M. Straight, MacDonald College, Que.

Fig. 1—A Common Tomato Crate.

THE production of fruit and vegetables is one thing, the getting of it on the market is another. It is in the latter that many fail. Many a man has had the satisfaction of producing the best fruit and vegetable in the locality and lots of them, yet his work has has been a failure for the reason that his produce was poorly picked, poorly graded, poorly packed in poor rates and as a consequence sold at a poor price.

Practically half the profit in fruit and vegetable growing depends upon the condition in which these products reach the consumer.

If you visit any of our market places, you will be surprised not so much at the amount of produce going in, as the amount of garbage coming out. This is one of the reasons why the difference between the wholesale and retail price is so striking. Especially is it true of fruit. The retailer is obliged to charge in addition to cost and legitimate profit, a price to cover cost of produce that he purchased but could not sell. The crate, the grading, the packing is at the bottom of much of the trouble.

If you want the best price for your produce three things are essential. 1st, produce the article that the market demands, or in other words, please your customer ; 2nd, make it attractive ; 3rd, see to it that the crate has stability sufficient to protect against all contigencies which may arise, and that the produce is firmly placed in it.

It is foolishness to quarrel with your customers. It is no use to try to convince men that a green podded bean is quite as good as one of the wax varieties if they do not believe it, for they will not believe it when you are through ; nor is it any use to tell a woman that the red onion is no "stronger" than the yellow. You would not convince her and "stronger" onions are the only kind wanted by the next customer.

Fig. 3—Good Potatoes in an Unattractive Package.

ATTRACTIVENESS is another thing which is often lost sight of. It counts for more than we think. Some weeks ago we visited the fruit auction rooms in Montreal. The fruit came from the West. It was an inspiration to look at it. Nothing was too much trouble if attractiveness was added to the package. Thousands of boxes of cherries were there with exactly the same number in all. Care in the grading, care in everything, chartcterized every package, but pre-eminently they were attractive. We have a long way yet to go before we compete with the Western men. They have won the market in many localities because of the package and they will hold it until we meet them on common ground.

Fig. 2
Packing Tomatoes in New Brunswick

Much may be done to make packages attractive by "facing" and still have an honest pack. The face layer should be of the same quality as the others yet there is much in placing it to advantage. Strawberries placed with stems down add much to the appearance of the fruit. In fact the difference is so marked that the fruit in the two boxes seems totally unlike.

I know of one case where a man turned the stems down on the top layer of one crate in five minutes after his load was on the wagon and he had started for the town. It sold at one cent more

Fig. 5—Melon Crate at MacDonald.

The gin box, as seen in the above illustration, is a common tomato crate. It has the advantage of being cheap and is easily obtained, but tomatoes thrown in such a receptacle jam a great deal and are far from being attractive. This other illustration is the common method of putting tomatoes on the market in the Province of New Brunswick The boxes hold five pounds and by placing them in large crates, sixteen boxes or 80 lbs. are easily carried without injury to fruit.

The basket used at MacDonald College is very satisfactory for tomatoes, it is the ordinary fruit basket. A study of these two illustrations is sufficient to convince one that the package is very important. The ordinary consumer is willing to pay a cent or two more per lb. for tomatoes in the attractive package. This usually presents to the grower all of his profit.

The best customer is not anxious to get his potatoes from a barrel as shown in illustration 3. He does not stop to enquire as to quality. The burlap rug was sufficient to cause him to look elsewhere. The other barrel has head removed, showing potatoes. It pleased him better.

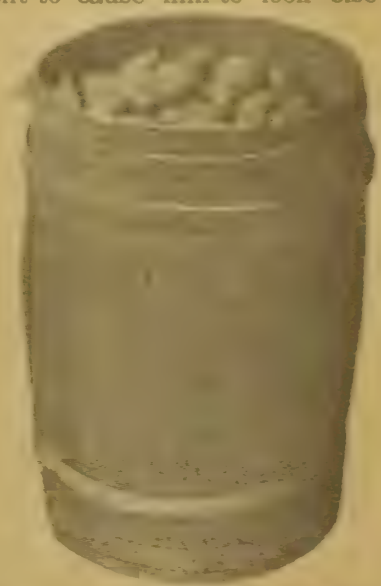

Fig. 4--Potatoes In Attractive Package

per box, and the quality was exactly the same as the others.

This is an honest and perfectly legitimate practice provided the entire contents are fruit of the same grade as those placed on top. Inferior stuff should never be faced with prime specimens. As has been said there is neither cash nor character in such practice.

Stability of package and firmness in placing is perhaps your greatest safeguard. The pressure on the bottom is very great in a car load. If the crates cannot stand the strain there will be loss to the grower. The shipper cannot know which one is going in the bottom, so he must make them all alike, and all overstrong.

See to it that the packed article is dry and cool. Dryness and coolness are the greatest enemies of bacterial soft rots and the work of fungi. When you have secured these conditions, place the produce in as firmly as may be. Loose packing causes bruises, and the general defacement of each specimen; while if too tight, you may still have trouble.

When everything is ready, be sure that you have proper covers and that they are securely nailed down. Covers hanging off, and fruit and vegetables rolling on the deck of steamer or on floor of car are scenes too often witnessed.

The label is also an important factor in the marketing. If the buyer is fortunate in getting a good article he likes to buy again from the man from whom he purchased before. He knows the goods and is willing to pay the price. An instance of this kind was recently brought to my notice. A man bought berries. The boxes were too small and were consequently marked "SHORT". The quality was exceptionally good, however. It was not long before he was back enquiring if he could obtain some more of Mr. Short's berries. The man who puts up an honest pack of first class fruit or vegetables in attractive and suitable package need not fear the expense connected with the labelling. If these simple things were more generally observed, we would hear less about poor markets. The home town demands your produce, if superior.

Figure 7 shows one method of packing celery. Note how each plant is firmly and closely packed. On some markets celery is bunched, with 12 or 14 plants to the bunch.

Figure 8 shows the ordinary method of putting the Montreal Melon on the market. It is attractive but rather expensive. The Crate is being used to some extent. The standard Melon Crate is of no use for the Montreal Melon on account of its great size. Great strength is required, for some of our big fellows weighed 19 and 20 lbs.

A Crate as in Fig. 9 was used at MacDonald College this year. It held 20 of the medium sized ones or one doz. of the larger.

It would seem that the box was destined to take the place of the barrel in the marketing of Apples. It has already done so in the West, and is constantly looked upon with more favor in the East. Both box and barrel are well known on most markets.

Hay is pressed tightly among the fruit so that bruising is impossible.

It is thus seen that each of the various products of the garden and orchard has, to a certain extent, its own particular characteristic, necessitating a different method of handling, and in many cases a different market to please.—E. M. Straight, MacDonald College.

D. I. Mundle has bought a pure bred Ayrshire heifer and bull from McIntyre Bros., of Sussex. The animals are very much admired by judges of good stock.—Review, Richibucto, N. B.

The National Live Stock Breeders' Association.

One of the most important of a series of conventions called this winter by the Minister of Agriculture, Hon. Martin Burrell, was the National Live Stock Breeders' Association, held at Ottawa on February 12th and 13th. It has been a matter of serious comment for some time past that the live stock industry of Canada was at a low ebb, and it was with a view of getting at the root of the cause, to have some light thrown on the matter and have remedies suggested that the convention was called.

Fig. 5 Carefully Picked and Faced.

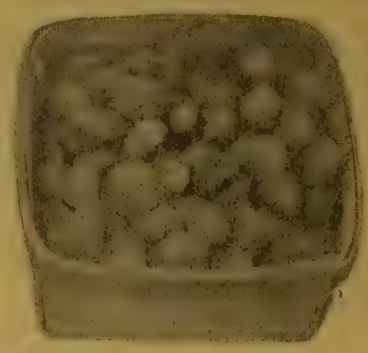

Fig. 6 Carelessly Picked.

Celery at McDonald College.

Montreal Melon Basket.

Some startling figures and facts were brought to light showing that a deplorable state of affairs existed, and many important resolutions were passed which will form a guide to the Minister of Agriculture and the Department under his control.

Every province in the Dominion was represented and the reports of each representative showed that there was need for a call to action. The most serious decadence seemed to be in the beef producing industry, while the sheep industry had reached a level that only immediate and vigorous action could revive.

Inadequate transportation facilities have much to do apparently in discouraging beef production in the West, and this side of the question was discussed at length. It is a significant feature that at the present time the Railway Commission is taking the matter up with the railway companies regarding what was termed the very unreasonable conditions under which the different companies accept live stock for transportation. The horse breeding business is going behind in so far as the production was concerned. The only thriving branch of live stock raising appears to be the dairy industry.

Hon. Martin Burrell, Minister of Agriculture, in a prelude to his remarks, said that the livestock men of this country were to be congratulated. The work that live stock men were doing in breeding, importing and improving the quality of the live stock in Canada was of immense value to the country, and a vital part of the national upbuilding of the country. He said that at the same time there was existent at present a condition of affairs that was a cause for anxiety in so far as the live stock industry was concerned. The beef cattle export trade, for instance, he said, was not in as flourishing a condition as it was twenty-fiveyears ago. It was disappointingly apparent that the live stock industry was not keeping pace even with wheat growing or with any other line of agriculture. There was an occasion for a reasanable call for encouragement from live stock interests, and the Government was prepared to give that encouragement. It was a debatable question just how far a government could go in helping any branch of farming, but as agriculture was the main pillar in the maintenance of prosperity in any country assistance consistent with the functions of a government was quite in order. The basic principle of agriculture was along educational lines, and it was along educational lines mainly that the Government proposed to assist. He did not believe in fraternalism, and while every other industry must receive the same consideration the live stock industry of this country should be established on a better footing. He assured his hearers that the Government was in sympathy with any move for improvement, that any resolutions the meeting might pass would receive every consideration. He made reference to the bill he introduced in the House of Commons on Monday to give the Government more power to assist agriculture.

It was better to move slowly than wrongly, before the Government could move intelligently it would be necessary to have a thorough survey of all conditions existing in Canada. While he was not prepared to make any definite statements, he said that it was proposed to give more assistance to the provinces, and to make more solemn and sane consideration.

He called attention to the constantly increasing proportions of the importations of live stock products into this country. "You can go down Queen street in Ottawa, and buy mutton from Australia, and beef in tins from the Argentine Republic. You can cross the prairies and do the same thing at Regina," he said.

"We hear a lot about the inexhaustible fertility of the soil of the West or of the soil here or the soil there. We have heard of the inexhaustible fertility of the soil of New York State and of the American middle west, but the same thing will happen to any inexhaustible soils Canada may have unless the farmers turn their attention more generally to the keeping of live stock. We must try to get the live stock to the farmer who tries to farm without stock to fertilize his farm from finally landing in the poor house and to husband our natural resources."

Dr. Rutherford gave an address on Bovine Tuberculosis, wherein he made the assertion that it wae his firm belief that bovine tuberculosis was the motherlode of tuberculosis in humans.

Mr. J. H. Grisdale, Director of Dominion Experimental Farms, spoke on the present conditions of the live stock industry in Ontario.

Prof. M. Cumming told of the conditions as they exist in Nova Scotia.

Dr. J. A. Couture gave a resume of how matters are progressing in Quebec.

Western conditions were reported by Miss E. Cora Hind, Winnipeg; Mr. P. M. Bredt, Regina; W. F. Stevens, Edmonton and Dr. F. Tolmer, Victoria, B. C.

RESOLUTIONS PASSED.

Resolutions were passed "in appreciation of the earnest efforts of the Department of Agriculture of the Dominion Government in organizing and

(Continued on page 362).

Nitro Culture, Its Distribution and Value

Again I beg to report on the increasing demand for and the value of Nitro Culture as a means of facilitating and establishing the growth of such leguminous crops as alfalfa, red and alsike clovers, peas, beans and vetches. In former years, these cultures were manufactured in our own Laboratories but, owing to shortage of time and competent assistance, we were obliged to have the work done elsewhere. Mr. F. C. Harrison, Professor of Bacteriology at MacDonald College, Quebec, kindly consented to manufacture these for the year 1911. With recent additions to the College staff, this work will be continued from our Laboratories and cultures distributed as formerly.

This report will deal exclusively with comparative yearly results and financial returns, but I would refer those desirous for further information on the history, methods of inoculation, physiology, and manurial value of nitro culture, to article in Annual Report for 1909. During the year 1911, 596 cultures were distributed.

From this may be seen, first, the keen interest and determined effort of our farmers to raise alfalfa; second, that a large number of farmers would improve their red clover and alsike crops; third, that this effort is due largely to two influences, viz., the good results of previous use of nitro culture, together with the educational influence of the Agricultural College and farm papers, such as The Maritime Farmer; lastly, many farmers have proven the use of all these cultures to be of commercial worth.

Compared with previous years, the results from the use of nitro culture are as follows:

Province	CROP.	Good Results from Culture. Ex. crop	Good crop	Fair crop	Poor crop	Total	No Difference Ex. crop	Good crop	Fair crop	Poor crop	Total

U. S. A.	1	1	1	1	1	1	6
Grand Totals	372	131	48	22	7	16	596

SIX YEARS RESULTS FROM NITRO CULTURE.

YEAR.	No. of Cultures Distributed	Excellent Results p. c.	Good Results p. c.	No Results p. c.
1906	50	50	33	17
1907	75	62	20	18
1908	110	50	20	30
1909	436	59	26	15
1910	524	53.4	18.9	27.7
1911	596	40	25.2	34.8

From a study of the above table, it may be seen that results are, in general, similar to those of former years. However, the exceedingly dry summer of 1911 in many districts not only depreciated, to a large extent, the value of grain crops, but also totally destroyed clover and grass seed; in fact, many report these seeds not even germinated. This explains the higher percentage of those reporting no results from the use of culture. Of the 501 cultures distributed in the Maritime Provinces, over 300 reports have come to hand. The first 230 reports represent fairly the results from the use of culture and the character of the crop. These have been tabulated as follows:

The question of regulating the soil moisture by cultivation and underdrainage has a large influence upon leguminous crops. In gathering above reports, we have acquired much data regarding methods of cultivation and, where present, rotation of crops. We are pleased to note a keener interest in such operations. Although the drought was a great draw-back in this year's results, yet a large percentage reporting almost total failure, mentioned the marked results from the use of culture. Again, we notice a large percentage of dirty seed beds and impure seed. Thirteen percent. of the 230 reports show need of underdrainage; while twenty-one percent. report need of lime; over sixty percent. claim the needs of more fertilizer, particularly phosphoric acid and potash. Reports showing excellent crops, with no difference between treated and untreated seed, state the fact that good catches of this crop have been procured during previous years, thus showing the presence of that specie of bacteria.

The experience of various experiments during 1911 are fairly well represented by the following extracts:

Mr. R. D. Ross, of Bayview, N. S., reports on alfalfa a decided difference in favor of the use of culture, both on old and new land. This is of a dry, sandy nature, a nurse crop of wheat being used and treated seed, especially, making splendid growth until the late fall.

Mr. C. B. Macdonald, Upper Kemptown, on red clover reports that in 1909 he first used nitro culture, with marked improvement; in 1910 having nearly 25 percent. better cut on the treated land. In 1911 he used culture for clover and sowed where he had never been able to get a catch before, with good results, though the land needs draining. He states that he would like to use culture each year as an insurance on the crop.

Mr. Douglas Kemp, of L'Archeveque, Richmond Co., reports splendid results from the inoculation of alfalfa seed. Although on poor land, his treated alfalfa did exceptionally well. The use of nitro culture on red clover increased the height of crop and trebled the number of nodules on roots.

Mr. Wm. J. Baxter, of Dartmouth, N. S., reports similarly on peas.

Mr. Albert MacLeod, of Landsdowne, Pictou Co., and Mr. J. MacLean, Newton, Guysboro Co., report the treated crop of red clover being taller and ranker, more uniform in growth and more nodules on roots. They, too, think that it pays to use nitro culture, even on land where they had formerly obtained fair or good crops.

Mr. Frank Glydon, of Margate, P. E. I., states, as follows:

"There is very much difference be-
"tween treated and untreated alfalfa.
"Never being able to obtain a good
"catch previously. This was sowed
"on a piece of land apparently run
"out and on which we could never
"get clover to grow. In 1909 I gave
"it a good coating of manure on
"sod, cropping it in 1910 with corn
"and potatoes. That fall I gave it
"a light coat of manure, seeding in
"the spring 1911 one-half in clover
"and the other in alfalfa. Where
"treated, both gave an extra catch
"and I think the cultures the beneficial means of success."

These and many other men might be quoted to show the influence of nitro culture throughout the three Maritime Provinces. A general summary would be but a repetition of that contained in the Report for 1910 or in directions as sent with cultures. I would particularly warn experimenters not to open cultures until ready for use and would add that, as a rule, cultures over 2 months old have lost a large amount of their vitality; hence, should not be used. Of the 1790 cultures sent out during the past six years, from carefully tabulated reports, we are prepared to say that great commercial benefit has resulted. Over 45 per cent. have reported a large increase in crop during succeeding years, especially in red and alsike clovers. If we figure this as a 10 per cent. increase above the average crop of 1.5 tons per acre, on each 10 acre field, we would have an increase of 1½ tons. If 600 cultures for these two clovers have given such an increase, as we have every reason to suppose, it means that to these provinces has been added, in the first crop alone, $9,000 increase. The increased value of succeeding crops and the permanent addition of atmospheric nitrogen to the soil would be worth fully as much. I feel sure that these figures are very conservative.

Aside from this, we have many other advantages, as shown by the greater study and interest in relationship of drainage, lime, potash, and other physical and chemical needs of soil toward the production of leguminous crops. Greater interest is being taken in Soil Bacteriology. Finally, the future possibilities of alfalfa raising in these provinces depends wholly upon the above influences, together with seed acclimatization and selection. Hence, nitro cultures should and will play an important part in our Maritime agriculture for some years to come.—N. S. Agricultural College Report for 1911.

Yes! Label Our Stallions.

Editor Maritime Farmer:—

Prof. Cumming's article. "Shall we Label our Stallions" in your issue of Feb. 13th, opens a question which is of prime importance to the horse breeders of New Brunswick as well as those of Nova Scotia.

I hope such an interest will be aroused among the farmers of this Province that it will place New Brunswick in line with the most progressive countries in respect to legislation on the subject.

It is absurd for the Government to bring in and distribute pure-bred stallions and mares for the improvement of the horses of this Province and then allow their efforts to be nullified by any one who may have an entire horse of any or no breed, sound or unsound, travelling through the country.

The Government of New Brunswick has been importing pure-bred stallions of the draft breeds for 30 years at least, and though we have some good horses they are largely in the minority.

In no way can the quality of our horses be improved as easily as by the elimination of the scrub stallion. If the Wisconsin law were enacted here it would do it.

I hope that at the Meeting of the Farmers' and Dairymen's Association this matter will be taken up and thoroughly discussed.—Morris Scovil, Meadowlands, Queens Co., N. B.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations: The New Brunswick Fruit Growers' Association: The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler: but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents; 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

ON THE THRESHOLD OF AN INDUSTRIAL DEVELOPMENT DECADE

The money you spend in improving your surroundings or in upbuilding and boosting industries in your own town or province will come back to you again bearing a good fat interest, triple conpounded. The money you spend on foreign enterprises, helps to upbuild the other fellow's country and impoverishes your own. It may never come back to you again. There is a field for industrial developement in Maritime Canada, that is unexcelled by any other country under the broad canopy of heaven.

Maritime Canada has thousands of miles of sea coast with harbors, in which the fleets of nations can ride at anchor, unmolested by tempests that may rage without. The toll exacted from these briny coastwaters by those who go down into the sea in ships is no mean figure.

The bowels of the Maritime Provinces are rich in minerals of many kinds. Bringing these minerals to the light of day and putting them through the various processes they must undergo before being fashioned and distributed for home and foreign manufacture, gives employment to thousands of laborers and artisans. Although mining has been carried on in the Maritime Provinces for a great many years the industry is, practically speaking, still in its infancy, as large areas of mineral deposits have never been exploited and those that have been developed give indications of almost inexhaustible quantities.

Our forests, everlasting as they seemed a few years ago, have been ruthlessly slaughtered in the past; many areas that should never have been cleared have given way to the sway of the woodman's axe and destructive forest fires. Our supply is, however, not by any means exhausted. There are still thousands of areas of timberlands that have not been properly cruised. Our better thinking and most progressive lumber-tract owners are awake to the necessity of conserving our forests "natures balance wheel" and are arranging their cuts so that, instead of being the agents of destruction they have been in the past, the children yet unborn will call them blessed for the conservation schemes they are now inaugurating.

Our soils are fertile and yeild handsome returns as rewards for industrious toil. The Nova Scotia Agricultural College is doing an inestimable amount of good in teaching our farmers how best to get maximum crops from the soil with the minimun amount of soil depletion. Our farm homes are as happy and contented as those of any other country and well they may for the sons and daughters of Maritime Canada possess a heritage the peer of which is not found in any other clime.

Realizing the importance of the Maritime Provinces as the home of a progressive people and as the gateway and the future workshop of Canada, great amounts of money will be spent by the federal and provincial parliaments as well as by individual enterprise in developing our Maritime resources during the next decade. We are now at the threshold of great industrial developement. Millions of dollars will be put in circulation and no matter what a person's occupation may be, a share of the money is sure to come to each and everyone who will be employed in a legitimate occupation in Nova Scotia, New Brunswick or Prince Edward Island. Brisk industrial developements also call for a lot of extra labor. Extra labor means more consumption of food. A greater demand for food commodities will bring seasons of prosperity to our farmers. Think the situation over. Are you as a farmer going to take your share of the prosperity that is sure to come with any "Eastern Boom." It's up to you. This is a good season to plan and prepare to grow crops during the succeeding seasons that are sure to be in high demand at renumeration prices. Be ready for your share of the inevitable prosperity.

THE GREAT WHITE WAY.

Mr. H. Maxwell Clark of the Canadian Highway Associatiation has been in the Maritime Provinces during the past week in the interest of a movement which object is to build one main trunk road across the continent, from the Atlantic to the Pacific. This "Great White Way" as the proposed highway has come to be called will be conducted as a matter of public utility.

Bad roads are the bane of the farming industry, particularly in the Maritime Provinces. Mr. Clark is securing the co-operation of the provincial governments, mapping out the routes and doing tne preliminary work. The road will begin in eastern Cape Breton, probably at Sydney or Glace Bay and will extend to Prince Rupert on the Pacific coast. The Canadian Highway Association was organized in New Westminster, B. C. last November. It is impressed with the belief that by building a trsnscontinental highway there would be laid the nucleus of a road system unequalled in the world, because it would undoubtedly tend to encourage the building of smaller branch roads, connecting the main highway with all points of importance on either side. Large sums of money are expended on the roads in the Maritime Provinces. Despite this fact, the deplorable condition of many miles of road testify to the fact that the money expended has been practically thrown away.

The greatest result looked for through the construction of the proposed highway is a "back to the land movement." Nothing offers a greater hindrance to the settling of our vacant farm lands by a desirable class of immigrants than bad roads. New towns and new markets do not depend altogether on new lines of railway. The building of the new "Great White Way" will undoubtedly mean the building of new towns Travel will be made easier, access to the markets readier, and transportation charges smaller. The high freight rates are supposed to be responsible in some measure for the high cost of living. While this may be true, the execrable condition of our roads, which makes transportation difficult and therefore expensive, must be held to be equally responsidle for the condition.

Success to the "Great White Way."

FOR A GOOD ROADS MOVEMENT!

At a recent meeting of the Sussex & Studholm Agricultural Society, Mr. J. T. Prescott one of the most prominent and progressive farmers of the district made the assertion that in order to keep rural roads in good repair the present system is wholly inadequate. All railroads have a corps of track or section men whose duty it is to go over their respective sections of track every day and make the necessary repairs as soon as the need of repair is noticed. Cities and incorporated towns also look after their streets by having corps of men continually at work effecting a small repair here and another one there. It is a well known fact that these railways, cities and towns find it a paying proposition to attend to these small repairs early in the game rather than leave them a menace to rolling stock and the general public.

It is an easy matter to critise along destructive lines: to critise along constructive lines is anoeher matter. Mr. Precott's criticism of present road conditions, we are pleased to say is of the constructive kind. He suggests that for every 20 or 25 miles of rural roads a man should be appointed whose duty it would be to take his team and go over his section of road at frequent intervals effecting repairs, by filling a rut here, changing a destructive water course there, filling in the bumps at crossways and throwing all the loose stones from the track. One active man with a horse and cart would be able to keep a long stretch of road in good repair and at very little expense. The wear and tear on horses and rigs obliged to travel over such roads would be much reduced and the trip from farm to town could be made by the farmers much more expeditiously than can be accomplished over roads with which the elements have been playing havoc, maybe for years without a hand being lifted to stop their ravages. We trust the powers that be will look into this matter and see their way clear in instituting a system of road repair along the lines suggested by Mr. Prescott as will redound to the good of the country in general and the farming class in particular

The Septic Tank for Disposal of Sewage

The following article is published in response to the request of a Subscriber, who is interested in the disposal of sewage, where the land surrounding his house is nearly level and where running water is available:

Certainly one of the most hopeful signs of progress, one might almost say of advancement in civilization, at the present time is the widespread desire in the country home for a better and more convenient water supply, for a bath-room, and for those sanitary conveniences (closet, sink, laundry, &c.), which go so far towards making the difference in comfort between the city and the farm house, especially in the winter. The requests for information regarding these matters, and particular,y respecting some simple and effective method for the disposal of the sewage from the farm house, have been very numerous during the past year.

As regards the latter question, these inquiries have been answered by an account of the septic tank system, a comparatively speaking new system, but one that has proved highly satisfactory, as far as the writer is aware, wherever it has been tried. In many instances this correspondence has further led to requests for details, dimensions and drawings. It has, therefore, been thought advisable to insert the following detailed account of this system with illustration in the Annual Report, since its publication in this way will not only bring the matter prominently before a very large number of farmers, but will place on record in an available form particulars which it is almost impossible to furnish in the limited scope afforded by an ordinary letter.

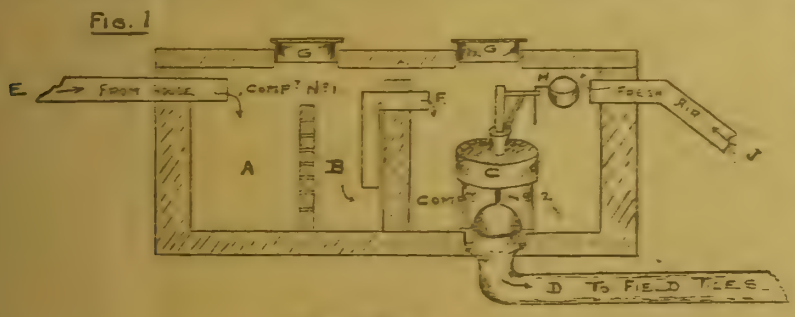
We have no hesitation in saying, at the outset, that there is no method of sewage disposal at once so effective, so cheap, and so simple for the farm house, the creamery and the cheese factory,as that which is known as the Septic Tank System. For its working, a water supply in the house or building is necessary, but there is no good reason now-a-days why such should not be obtainable on the majority of farms. There are many means of bringing water from a safe, and perhaps fairly distant source, into the house and barns, and one or other of these, as circumstances dictate, should be employed. Apart from the question of sewage disposal, apart from the convenience and the saving of labour that would follow, such a water supply must now be considered from the health standpoint most desirable, if not a necessity. Reference to results given annually in these reports show that the shallow well, sunk in the barnyard or about the farm buildings ought to be abandoned. Such wells are always a menace to the health of the farmer and his family, and his stock. With a water supply in the house—even though that may consist merely of a tank in one of the upper rooms periodically filled by a force pump, and from which pipes lead to the bath room and kitchen—there is nothing to prevent the installation of this system which, as one writer or authority puts it, is at once 'inexpensive, absolutely automatic, scientific, simple, and in every way thoroughly efficient and satisfactory.'

Very briefly, the system may be outlined as follows:—The sewage or waste from the closet and sink is conducted by the soil pipe, 4 inches in diameter, into a tank, situated outside the building, in which, without the addition of any chemical or disinfectant, but simply by the action of certain self-sown microbes or bacteria (which accomplish their useful work of destruction largely in the absence of light and air), its organic matter—its filth—is decomposed and rendered harmless, and moreover its disease germs, if any are present, destroyed. The effluent or what might be termed purified sewage is now discharged automatically and intermittently from the tank, either into a filter box containing gravel or sand, or coke, or, better still, into a system of subsurface or distributing field tiles of unglazed ware which allow the effluent to soak into the soil throughout their whole length. The distance from the house to the tank is not a matter of any moment. The tank must be water-tight, and may be constructed of brick or stone cemented or, preferably, of concrete. When this system was first put into use it was supposed that light and air prevented the development of the filth destroying bacteria and, therefore, that it was essential for the tank to be practically light tight and air tight. Further, it was held that the inlet and outlet should be so arranged that the sewage would not be disturbed by currents. According to certain authorities it is still believed that the bacteria can only do their best work under these conditions. More recent investigatians, however, go to show that such precautions are necessary. The bacteria which are engaged in this destruction, or rather nitrification, of the organic matter of the sewage do not all belong to that class which can only thrive in the absence of the oxygen of the air. However, these considerations need not be here further discussed. It is sufficient for our present purpose to know that the system as consisting of the closed tank and distributing tiles, is efficient alike in the satisfactory disposal of house sewage and waste from the cheese factory or creamery.

For practical purposes—that is, for the installation of the system—the following details and the accompanying illustrations will no doubt prove serviceable.

Figure I. represents a tank fitted with the automatic discharge valve. The size of the tank for the ordinary farm house may be 6 feet long by 3 feet wide by 3 feetdeep,or a working capacity, say, of 120 gallons to each compartment. Since it is apparently desirable that the sewage should be submitted to the action of the bacteria for a period of 24 to 36 hours before passing into the second compartment of the tank, it is perhaps better to have the tank a little too large than too small. It is customary to allow a capacity of 12 gallons for each person. It will be seen that by a partition wall, carried within two inches of the top or roof, the tank is divided into smaller tanks or compartments, figured as No. 1 and 2. Into the first of these, near the top, the sewage from the house flows through the glazed tile E. connected with the soil pipe which opens above the roof. The pipes from closet, bath, sink, &c., should, of course, be trapped before entering the soil pipe.

In this tank or compartment (No. 1) there should be a perforated partition, as shown in cut, to prevent paper and other solids entering the overflow and being carried over into compartment No. 2. It is in No. 1 compartment that the bacteria chiefly effect their work of decomposing the organic matter of the sewage, and when in time this compartment becomes full its fluid contents pass over into No. 2 by means of the overflow F. If there is no perforated partition in No. 1 the lower orifice of this overflow (F) is covered with wire netting which may act as a strainer to prevent any paper, &c., passing into No. 2. In compartment No. 2 is the automatic valve H., connected with the discharge pipe D, which carries off the effluent to the subsurface tiles (see figure 2). The success of the system depends largely upon this valve, for it is essential that compartment No. 2 should be emptied as soon as it is full, and then allowed to refill. This can only be satisfactorily accomplished by a self-acting (both opening and closing) valve.* This second chamber should have a 4-inch vent pipe, to allow the entrance of air. Manholes are provided at G, to permit of the examination of the tank at any time. The probabilities are, however, that no cleaning out will be necessary for years, as the action of the bacteria is very thorough and complete in destroying the organic matter.



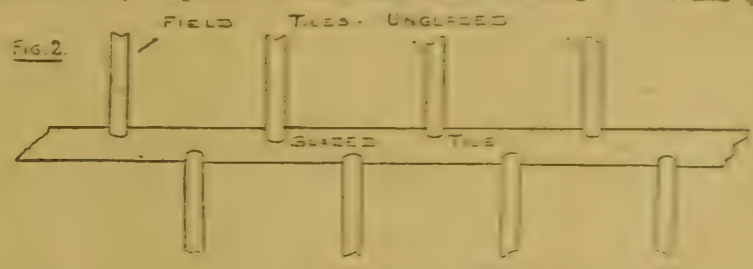
Septic Tank

The tank must be situated that its glazed discharge pipe D. at the point from which the field tiles are led off is not more than 12 inches below the surface of the ground. This pipe as well as the field tiles are to be laid on a level so that the latter will be equally filled when the tank is discharged. If the ground be level, this will necessitate constructing the tank so that a portion of it is above the surface of the land, and in this case it should be banked around, covered with earth and sodded. It is not essential that the tank should be close to the house, but if placed at a distance the inlet pipe should have a fall from the house and be protected from the frost. Unglazed field tiles inserted every two or three feet along the discharge pipe D. finally distribute the effluent through the soil (Fig. 2). If desired, these distributing tiles from D need not commence in the immediate vicinity of the tank, but it is important that they should not be at a greater depth than 12 inches, unless the soil is very light and sandy and has good natural drainage. Since a 4-inch tile holds ¼ gallon and it is essential that there should be the capacity for all the effluent immediately on discharge a tank with a compartment No. 2 of 100 gallons will require at least 200 [illegible] If the soil is heavy clay it should be underdrained. When the soil is of such a character that percolation is very difficult the distributing tiles may be replaced by a 'filter box' of sufficient size, filled with sand or gravel, or coke, the effluent entering near the top at one end and being continued away from the other end by subdrains. However, in practice it is found that a larger tank with ,ess frequent discharge and more tiles is preferable to a filter box.

This system is in operation in many parts of Canada and has proved satisfactory wherever operated, so that it cannot be regarded as an experiment. It is in use in rural homes, in several cheese factories and creameries, in asylums, factories &c. and in every instance, I believe, it is working efficiently.

In the preparation of this article, the writer has consulted Dr. P. H. Bryce Chief Medical Officer of the Department of the Interior, who, when Secretary of the Provincial Board of Health for Ontario, was instrumental in introducing this system into various public institutions. He authorizes the statement that after 15 years' experience this system properly installed has proved the most sanitary and most economical method yet discovered for sewage disposal on a moderate scale.—Frank T. Shutt, Chemist, Experimental Farm, Ottawa.

*An automatic discharge valve is made by the Dominion Valve Co., Toronto. The price is from $18 to $25, according to size and quality.



Distributing Tiles

Clydesdale Association.

The two hundred members of the Clydesdale Horse Association, who met in Toronto February 2nd, were given a very satisfactory financial statement of the year's affairs. There is a cash balance of $14,[illegible], with over $5,000 expended in grants to various exhibitions. Mr. John Bright, the retiring president, delivered an address in which he pointed out that the association was now the strongest of the kind in the world, being even wealthier than the parent organization in the Old Country. The new regulations making it compulsory for every horse to be recorded which were introduced two years ago had proved of great value he said, and had also had the effect of breaking up the older association in Scotland, which was obliged to conform to this rule.

New officers were elected by acclamation, Mr. Robert Graham, Bedford Park, becoming president: Mr. John A. Boag, Queenville, vice-president: Mr. Peter Christie, Manchester, vice-president for Ontario: Dr. Graham also being appointed representative to the Toronto Exhibition. Mr. J. W. Wheaton is the new secretary succeeding Mr. J. W. Sangster.

HORTICULTURE.

When to Spray and What to Use.

Every man should know what he is spraying for and employ means to attain the desired result. Be ready and begin early. It is easier to keep the enemy away than to drive him away. When fighting insects it is necessary to know if the pest chews its food, for if not, contact insceticides or other means must be employed. Sucking insects as a rule, produce a wilting or discoloration of small areas and sometimes curling of the leaves; such attacks must be checked by the use of contact insecticides.

Biting or chewing insects devour portions of the plant and the poison, in order to be effective, must be applied where it will be eaten. If this is done early in the season, most excellent results may be obtained. Young insects usually succumb much more quickly than older ones.

It must be remembered that Insects and Fungous diseases are of entirely different nature. The two most important Fungicides are Ammoniacal Carbonate of Copper and Bordeaux Mixture.

APPLES—(Scab, Codling Moth, Bud Moth). 1st application; Spray before buds start, using copper sulphate solution. 2nd application: Just before blossoms open, bordeaux. For Bud Moth, Paris green when buds open. 3rd application: Within a week after blossoms have fallen, bordeaux and Paris green. 4th application: Eight to twelve days later, bordeaux. 5th application: Ten to fourteen days later, bordeaux.

CABBAGE—(Worm, Aphis). 1st application: When worms first appear, kerosene emulsion. 2nd application: Repeat in seven to ten days if plants are not heading. 3rd application: If worms reappear, repeat if not heading. 4th application: After heads form use Saltpetre for worms, a teaspoonful to a gallon of water. 5th application: When plants are small Paris green may be used to check worms.

CARNATION—(Rust and other fungous diseases, Red Spider). 1st application: When rust is first noticed, bordeaux. For Red Spider, kerosene emulsion. 2nd application: For rust repeat first in ten to fourteen days. For Red Spider, repeat in three to four days. 3rd application: Repeat second, using ammoniacal carbonate of copper if plants are in bloom. 4th application: Repeat second if necessary. ...

CHERRY—(Rot, Aphis, Slug and Curculio). 1st application: As buds are breaking, bordeaux. When aphis appear, kerosene emulsion. 2nd application: When fruit has set, bordeaux. If slugs appear, dust leaves with air-slacked lime. 3rd application: Ten to fourteen days later, if signs of rot appear, bordeaux. 4th application: Ten to fourteen days later, ammoniacal copper carbonate.

CURRANT—(Mildew, Worms). 1st application: At first sight of worms, Paris green. 2nd application: If worms reappear, repeat. If leaves mildew, bordeaux. 3rd application: If worms still trouble, hellebore.

GOOSEBERRY—(Mildew, Worms). 1st application: When leaves expand, bordeaux. For worms, Paris green. 2nd application: Ten to fourteen days later, repeat. 3rd application: Ten to fourteen days later, ammoniacal copper carbonate. 4th application: Repeat in ten to fourteen days if necessary. 5th application: If mildew persists after crop is gathered, bordeaux.

GRAPE—(Fungous Diseases, Flea Beetle). 1st application: Before buds burst, copper sulphate solution. For flea beetle, Paris green. 2nd application: When leaves are half grown, bordeaux. Paris green for larvae of flea beetle. 3rd application: As soon as fruit has set, bordeaux. 4th application: Ten to fourteen days later if any disease appears, bordeaux. 5th application: If necessary, ammoniacal

PEACH, APRICOT—1st application: Before buds swell, copper sulphate solution. 2nd application: As soon as the fruit has set, bordeaux. 3rd application: Ten to twelve days later, repeat. 4th application: When fruit is nearly grown, ammoniacal copper carbonate. 5th application: Repeat last if necessary in five to ten days.

PEAR—(Codling moth, Psylla Leaf Blight, Scab). 1st application: Before buds start, copper sulphate solution. 2nd application: Just before blossoms open, bordeaux. Kerosene emulsion for psylla when leaves open. 3rd application: After blossoms have fallen, bordeaux and Paris green. 4th application: Ten to twelve days later, repeat if necessary.

PLUM—(Rot, Fungous Growths, Curculio). 1st application: As buds start, copper sulphate solution. 2nd application: When fruit has set, bordeaux, Paris green. Begin to jar trees for curculio. 3rd application: Ten to twelve days later, repeat. 4th application: Ten to twenty-three days later, bordeaux. 5th application: two to three weeks before plums ripen, bordeaux and ammoniacal copper carbonate.

POTATO—(Beetles, Blight). Soak seed for scab in corrosive sublimate solution (2 oz. to 16 gals. of water) for 90 minutes. 1st application: When beetles first appear, Paris green. 2nd application: When vines are two-thirds grown, bordeaux. Paris green for beetles if necessary. 3rd application: Ten to fifteen days later, repeat if necessary. 4th application: Ten to fifteen days later, bordeaux if necessary.

RASPBERRY, BLACKBERRY—(Anthracuose, Rust). 1st application: Before buds break, copper sulphate solution. 2nd application: When new canes are one foot high, bordeaux mixture. 3rd application: During eummer if rust appears, bordeaux. 4th application: After crop is gathered remove old canes and spray with bordeaux.

ROSE—(Mildew, Black Spot, Red Spider, Aphis). 1st application: Mildew, keep heating pipes painted with equal parts lime and sulphur mixed with water to a paste. 2nd application: Black spot, spray plants once a week with weak copper sulphate. 3rd application: Red Spider, kerosene emulsioo to under side of foliage. 4th application: Aphis, kerosene emulsion. 5th application: Solution should be very dilute as rose foliage is easily injured.

STRAWBERRY—(Rust). 1st application: Just before blossoms open, bordeaux. 2nd application: As first fruits are setting, bordeaux. 3rd application: When first fruits are ripening, ammoniacal copper carbonate. 4th application: When last of fruit is harvested, bordeaux.

TOMATO—(Rot Blight). 1st application: At first appearance of rot or blight, bordeaux. 2nd application: Repeat if diseases are not checked.

CATTLE—For Lice, Fleas, Ticks or Horn Fly use Kerosene emulsion.

Control of Coddling Moth.

In the laboratory fungicidal tests on spore germination with summer spores (conidia) of the apple scab fungus were made. Lime-Sulphur alone diluted 1-50 reduced germination from 50 per cent. to 12.5 per cent., while with 1-100 and Lead Arsenate added at the rate of two pounds to 50 gallons it was reduced from 66 to 0 per cent.

On the trees apple scab was reduced from 79.4 per cent. to 29.5 per cent. by Lime-Sulphur 1-30 alone, and to 10.9 per cent. by the same concentration of Lime-Sulphur with Lead Arsenate added.—Cornell Bulletin 284.

TRAMPED 60 MILES TO SAVE HIS CHUM

Prospector at Larder Lake Got Back with GIN PILLS Just in Time.

LARDER LAKE, ONT., MARCH 26th, 1911.

"I am writing to tell you the good GIN PILLS did me. I had been suffering for some time with my Kidneys and Urine. I was constantly passing water which was very scanty, sometimes as many as thirty times a day. Each time, the pain was something awful and no rest at night. I began to feel worn out. I heard of your GIN PILLS and decided to give them a trial at once. I sent my chum out to get them (about 60 miles) —and I am pleased to inform you that in less than six hours, I felt relief. In two days, the pain had left me altogether. I took about half a box and to-day I feel as well as ever and my kidneys are acting quite natural again. Thanking you for the pills which I always intend to keep by me. Yours respectfully,

SID CASTLEMAN.

WELCOME RELIEF.

We have never received a letter that pleased us more than this one. When we realize what Gin Pills meant to this sick man, lying on a bed of pain miles away from a doctor in the frozen north, and how they helped him, we feel that our efforts to prepare a standard preparation for Kidney and Bladder Troubles have been crowned with success.

GIN PILLS is a wonderful solvent for uric acid. It instantly neutralizes the hot, scalding urine, allays the burning pain, soothes the irritated bladder and heals the kidneys. Take GIN PILLS on our positive guarantee of a cure or your money back. 50c. a box, 6 for $2.50. Free sample, if you write mentioning this paper, The National Drug & Chemical Co. of Canada, Limited, Dept. M F Toronto.

NATIONAL LAZY LIVER PILLS are a positive cure for Constipation, Biliousness, Sick Headache and Sour Stomach. Excellent for Indigestion. 25c. a box. 112

SYDNEY BASIC SLAG

WORKS NOW IN FULL OPERATION
IMMEDIATE DELIVERY CAN BE GIVEN

OFFERED IN TWO GRADES:—

"A" Quality is High grade, bearing **Green Tag, No. 557**
"B" Quality is Medium grade, bearing **Pink Tag, NO. 558**

BOTH REGISTERED WITH GOVERNMENT.

Farmers who want the BEST GOODS should Buy the SYDNEY SLAG with GREEN TAG No. 557

Being produced here and having no ocean freight to pay our prices are much lower than anything previously known. Buyers who can take delivery in carloads and pay cash with order can be supplied direct from Works.

Farmers who get Sydney Slag with Pink Tag No. 558 will understand they are buying a lower grade article.

Russeting of Apples.

Russeting of apples by Lime-Sulphur, is, at least, rare and of minor importance as compared with that caused by Bordeaux. Considerable natural russeting occurred the past season (1910) on unsprayed trees, especially on Baldwins, caused by certain weather conditions. In our experiments there was in both seasons even less russeting on the Lime-Sul-

Tandem Rollers Can't Get Off the Track

No other barn Door Hanger on the market positively and permanently overcomes all the troubles of clogging by either **birds in summer or by snow and ice in winter.** There's no opening in the **Louden Bird-Proof Track,** except a narrow slit. It is made of **one solid piece of steel pressed into shape.** Is rust-proof; will last a life time.

LOUDEN'S Bird-Proof HANGER

is the **only one on the market** having **flexible track** which prevents gathering of trash between track and barn.
If you are going to build a new barn or need new hangers for the old one, get the hanger that will never balk and is always easy to operate. It will ease your barn work greatly and save you time and money to put in **Louden's Tubular Steel Stalls and Stanchions, Feed and Litter Carriers, Hay Carriers and Balance Grapple or Double Harpoon Forks.** See them at your dealer's. If he has not our line write us for Free catalog and send your dealer's name.

Exhaustion of Soil Fertility.

Extract from

"Artificial Fertilizers; Their Nature and Use"

By

B. Leslie Emslie, C.D.A. (Glas), P.A.S.I., F.C.S.

"The fact remains that resource must be had to artificial fertilizers if the requirements of the soil for all the elements of fertility are to be satisfied, and the sooner a farmer becomes cognizant of this, the less trouble will he have in restoring a runout soil.

Last fall the writer happened to be discussing the fertilizer question with a farmer, who owns a farm of a very light, sandy-loam character, when the latter made the remark that if it were not for artificial fertilizers, of which he uses large quantities annually, his land would not be worth farming.

The same day, in conversation with another farmer, he happened to inquire whether the farmer used artificial fertilizers, to which question the latter replied to the effect that there was too little money to be made at farming to warrant its expenditure for fertilizers. Here are two different opinions, the one made by a man who had used fertilizers and proved their value, and the other by a man who knew nothing of the benefits to be derived from a judicious use of fertilizers, and who at the same time made the statement that farming was unprofitable."

FREE copies of this and other bulletins, dealing with the important subject of Fertilizing, may be obtained by application to

GERMAN POTASH SYNDICATE,
1102-05-06 Temple Bldg., TORONTO, ONT.

Here is a message of hope and good cheer from Mrs. C. J. Martin, Boone Mill, Va., who is the mother of eighteen children. Mrs. Martin was cured of stomach trouble and constipation by Chamberlain's Tablets after five years of suffering, and now recommends these tablets to the public. Sold by all dealers.

phur sprayed than on the unsprayed trees. We have not yet seen a clear case of russeting from Lime-Sulphur, but such have been reported, and we cannot dispute the possibility. Aside from the russeting, apples sprayed with Lime-Sulphur have invariably been more highly colored and had a finer, more waxy finish than those sprayed with Bordeaux.—Cornell Bulletin 284.

Spraying Mixtures.

KEROSENE EMULSION—For sucking insects, cabbage worms and insects with soft bodies. Coal Oil, 2 gal.; boiling water, 1 gal.; hard soap, ½ lb. Churn thoroughly. Dilute 5 to 20 times before applying.

PARIS GREEN—For insects which chew. Paris green, 1 lb.; water, 200 gal. When used on fruit trees, 1 lb. of quick lime should be added. Paris green and Bordeaux can be applied together if desired.

COPPER SULPHATE SOLUTION—For fungous diseases. Copper sulphate, 1 lb.; water, 15 to 25 gal. Is ready for use as soon as dissolved. This should never be applied to foliage but must be used before buds break.

BORDEAUX MIXTURE—For rot, moulds, mildew and fungous diseases. Copper Sulphate (Blue Vitriol) 6 lbs.; quicklime (good stone lime) 4 lbs.; water 50 gal. Dissolve the Copper Sulphate by putting in a coarse cloth and hanging in an earthen or wooden vessel containing 4 to 6 gallons of water. Slack the lime in an equal amount of water, then mix the two and add enough water to make 50 gallons.

AMMONIACAL COPPER CARBONATE—Copper Carbonate 5 oz.; Ammonia (26 degrees) 3 pints; water 45 gallons. Make a paste of the Copper Carbonate with a little water, dilute the ammonia with 10 to 12 quarts of water, add the paste to the diluted Ammonia and stir until dissolved, then add enough water to make 45 gallons. This mixture loses strength on standing.

HELLEBORE—For insects which chew. Fresh white Hellebore, 1 oz.; water 3 gallons. This poison is not so energetic as the Paris green and may be used a short time before the sprayed portions mature.

FIRE EXTINGUISHER—Muriate of ammonia, 1 lb.; Chloride of Potash, 1 lb.; Salt, 5 lbs. Pulverize and dissolve the above in 3 gallons of water. Next dissolve two pounds of Bi-Carbonate of Soda in two gallons of water. Mix the two solutions together and let it stand over night. A very little of this solution will extinguish a big blaze, for by throwing it beneath the blaze, the heat creates a gas and the fire cannot burn for want of air.

One pound of Baking Soda added to two gallons of water will also do effective work at a fire.

DISINFECTANTS—Carbolic Acid—in the proportion of a tablespoonful of the acid to a pint of water; or Formaldehyde—a 40 per cent. solution.

For contagious diseases and other purposes.

The Need of the Five Sprayings.

In our instructions we have advocated 5 sprayings to be made. Any number less than this would not be in the best interests of the growers. The writer in 1909 grew over 2000 barrels of apples. By omitting the 4th spray on account of dry weather, the damage to the crop by Black Spot was greater than the cost of all the spraying previously done and the estimated cost of the one omitted.

Out of 400 odd barrels of Fallawaters placed in storage, in one packing out of one shipment during the winter, there were 40 No. 1's, 9 No. 2's and 30 No. 3's, whereas if they had been clear of spot there should not have been over 3 or 4 barrels of No. 3's.

Do not fear putting on a late spray. The apple is in a safer condition to receive it. All fruit is more easily effected by spray when younger and still covered with minute hairs, and before its stomates have been changed into lenticels (Geneva Bulletin 287) a change which takes place about 6 weeks after the blossoms fall.

You Get all the Cream

from your milk only when your separator runs freely and smoothly.

This depends as much upon the oil you use to lubricate the separator as upon the separator itself.

STANDARD
HAND SEPARATOR OIL

is the one oil you can depend upon to keep your separator in the best running condition.

Standard Hand Separator Oil feeds freely into the closest bearings. It also has just the consistency or "body" needed to reduce friction between the delicately balanced parts to the lowest possible point.

Standard Hand Separator Oil never gums, never rusts, never corrodes. Your separator will pay better and last longer if you use it.

Ask your dealer for STANDARD HAND SEPARATOR OIL. One gallon cans.

The Imperial Oil Co., Limited.

DAIRYING.

Care of Milk Necessary for Purity.

I have often made the statement that any ordinary farm dairy, with the care that any good farmer can give it, can produce just as good and pure milk as the most expensive and eloquently equipped dairy. I want to repeat the statemsnt and emphasize it. Any man who is not attempting to keep and take care of more cows than he has any business to, or who does not expect to keep cows without giving them a proper unt of care, can keep his stable and cows just as clean and free from eria, and produce milk that is just ood and pure as the best millionaire dairyman.

This may sound at first like a pretty big statement, but after all, a thing that is clean is clean, and there is no reason at all why cows which are kept in an ordinary frame barn, which is kept clean and well ventilated, cannot be as healthy and clean as cows which are kept in a concrete or tiled stable. Of course this would prelude the use of a dark, damp and unlighted basement of a barn, but of course I do not believe in a basement stable for milking cows under any condition. It can hardly fail to be damp, and of course would be extremely difficult to keep free from bad odors and dirt generally.

It is very probable that a great many farmers excuse themselves from taking even fairly good care of their cows in the way of cleanliness because of their financial inability to build stables and dairy houses of the model sort, such as millionaire farmers, so-called, are building all over the country for the purpose of getting rid of some of their surplus money and for the satisfaction of doing fine things in a large way. But there is one thing that any farmer can do even if he has not a big bank account to fall back upon, and that is keep clean and keep his stables and cows clean. If a man can't and won't do that, he has no business to be keeping animals, anyway.

8 There are only a few things that are essential in producing pure milk, and they can be adapted to any farm by any farmer if he will do so. Healthy cows only can give pure milk, and to be kept in healthy condition the cows must have healthy quarters. The stable must be dry and comfortably warm, and well ventilated. The farmer may say he cannot afford to make the changes that will provide that kind of quarters for his cows. I know some farmers who have not that kind of quarters, and presumably they do not care or think they cannot afford to make the necessary changes. All I can say in regard to this is that such men have no business to be keeping cows and imposing upon the public with dairy products produced under such conditions. They ought to be compelled, by law if it could be accomplished in no other way, to confine their farming operations to the production of those things which can be produced out of doors, in the pure air, where the processes of nature will have some chance at least to produce what nature strives to produce—a pure article.

The next essential for the production of pure milk is to keep the stable clean. Not only should the manure be kept out of the cows' stalls, but the walls and ceilings should be kept so free from dust and dirt that there will be the least possible danger of contamination of the milk from that source. This is not an impossible or an unreasonable requirement. The man who thinks that sweeping down cobwebs and dust is too fussy work for the barn is not the man who will take pains enough to produce really pure milk. Dirt from above the cow is quite likely to get into the milk pail during the operation of milking.

A clean cow is another essentail to pure milk. Naturally any such thing as a caking of manure on the cow's flank should be absolutely tabooed. If the stable is clean and the cow has a clean floor to lie down upon, this will not be difficult. It is absolutely essential, anyway. It is not too much to ask that the cow's body and her udder especially shall be cleaned before the milking, so that no dirt from that source can get into the milk pail. The cow should be so clean that hairs will not be likely to drop into the pail during the milking. None of these things are toe difficult for the ordinary farmer, nor are they unreasonable to ask of him if he is to produce pure milk.

With a clean stable and a clean cow, is it too much to ask that the man who milks shall be clean also.

Clean hands and clothes from which dirt will not be shaken into the milk pail do not seem to me to be too much to ask of a farmer even if the farthest removed from the millionaire.

Too much can hardly be said about the importance of absolutely clean utensils, and for milk which is to be kept for any length of time the matter of cooling is quite important. After the milk is drawn, it certainly should be so handled that it will not receive any additional contamination, and be cooled and kept cool in order to retain its properties of sweetness.

The man who will do these things can produce a quality of milk than which certified milk can be no better. Let the man who thinks that only a rich farmer is able to produce certified milk, study these requirements carefully and see if there is anything here which the ordinary farmer cannot do just as well and just as successfully.--Maine Farmer.

About Dehorning Dairy Cattle.

The reason often given for not dehorning dairy cows is that it will cause them to fall off in their milk flow. If the cows are properly cared for aftet they are dehorned, they will soon recover from the shock of dehorning, and the decrease in milk flow will not be apparent as is often thought.

Twelve cows in the herd at the Kansas State Agricultural College were recently dehorned and a record of the milk production of each cow was kept before and after dehorning. The total production for the twelve cows for five days before dehorning amounted to 1,142.5 lbs. of milk. The total production of the 12 cows for a period of five days after dehorning was 1,100.7 lbs. of milk. The total decrease in milk for the 12 cows during the above period was 40.8 lbs. The average daily loss for each cow for five days was only .69 lbs., or about one-half pint. Two of the cows made more milk during the five days after dehorning than they did for the five days before dehorning; the other 10 produced less milk after dehorning. On the fifth day after dehorning, all except two cows were producing equally as much and some produced more than they did the day before they were dehorned.

TWO METHODS DESCRIBED

The best time to dehorn an animal is when it is only a few days old by using caustic potash. After the horns have made a fair growth they can best be cut off with the saw or clippers. The animals should be fastened securely in a position where the operator can get at the horns. The best method for fastening the animal is to put it in a chute built for this purpose. In sawing or clipping the horn, care should be taken to cut deep enough or the horn will grow out again. The clipping should be deep enough to includ a ring of skin and hair. The base of the horn that is amputated should show a ring of hair.

As soon as the horn is cut off, some disinfectant should be used on the fresh cut. Pine tar or some of the coal tar dips are good for this purpose. Dehorning should be done in late fall or early spring; at this time the weather is moderate and the flies do not bother the animals.—O. E. Reed, Kansas Agricultural College.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Butter With a Bitter Flavor.

Of the various troubles of the butter-making dairy, bitter butter is one which is most commonly met with in winter. This trouble is in most instances due to the manipulation of the cream being at fault. It is only where the cream is carefully ripened by the judicious application of starter that prime butter can be produced in cold weather. Bitterness in butter is caused by specific organisms which perform their functions when the cream in which they are present is maintained at a low temperature. These organisms act on the casein in the cream, and produce substances of a bitter nature, which are imparted to the butter. Bitter butter is most commonly met with on farms where the cream is left in a cold dairy for several days in the winter before churned. In summer the trouble seldom if ever, occurs. In the warm weather any bitter-flavour-producing organisms that were present in the cream would very soon be overcome by the germs thas sour the crerm and ripen it. At many farmhouses it is a common practice to churn only once a week in the winter. This, however, is not to be recommended generally, as, where prime quality butter is to be made, the churning should usually take place at least twice a week. Always get the cream properly ripened, in order to ensure the butter having a good flavour and keeping properties. It is best to keep the cream at a temperature of 68 degrees F., and inoculate it with a little good-flavoured starter. If there are no facilities at hand to maintain the cream at a warm temperature, it would be advisable to warm it to about 80 degrees F., and add a high percentage of pure culture starter.—C. W. Walker-Tisdale.

FREE! HANDSOME IMPORTED DOLL And LOVELY DOLL CARRIAGE
And This Handsome RING Set With a Sparkling Jewel
GIRLS—We want to give you, absolutely without a cent of cost, this beautiful Imported Doll, lovely Doll Carriage, complete with parasol; and this handsome jewelled Ring. This is the greatest offer ever made, girls—Don't miss it. This large, handsome doll is dressed complete from hat to shoes with lovely clothes, lace underwear, shoes, stockings, picture hat, etc. She can move her arms, head and legs, and close her eyes and go to sleep just like a real baby These are the best kind of dolls, and NEARLY HALF A YARD TALL.
The lovely carriage and parasol we give you with the doll, and it is a beauty Made of fine brown reed in the newest style, with strong, real steel wheels and axles enamelled a pretty blue, curved handle and a lovely silk-finished parasol and rod to complete it and protect dolly from the sun and weather. It is just the carriage you would love to have, and fit for the finest dolly in the land.
GIRLS—If you want this beautiful doll, and carriage complete with parasol, and in addition a lovely jewelled ring, send your name and address to-day, and we will send you, postage paid, only 25 of the handsomest jewellery novelties you have ever seen, to sell for us at only 10c. each. They are handsome novelties, everybody wants them and you will surely sell this very small quantity in a few minutes after school. When sold send us the money, only $2.50, and you will promptly receive all 6 presents: the handsome doll, lovely doll carriage with parasol all complete, and the lovely ring exactly as represented. DON'T DELAY.
We arrange to stand payment of all delivery charges right to your door. Remember when we say we will give you all these 5 grand presents for selling only $2.50 worth we will do so. Write to-day and you will soon be the proud possessor of all these grand presents. Address:

100 YEARS' WORK
At Less Than
2 CENTS PER YEAR

A regular Sharples Dairy Tubular Cream Separator recently finished work equal to 100 years' service in a five to eight cow dairy at a cost of less than 2 cents per year for oil and repairs. Here is the record. It proves that

SHARPLES
Tubular Cream Separators Are the World's Best

Size of machine, No. 4 Tubular.
Capacity per hour, 500 pounds.
Total pounds separated, 2,600,000.
Total turns of crank, 14,352,000.
Total cost of oil, 75 cents.
Total cost of repairs, 40 cents.
Time used in oiling, 15 minutes.
Time repairing and adjusting, 20 minutes.

This wonderful record was made by a regular Tubular—just like Tubulars that are rapidly replacing all others. Write for illustrated account telling all about it.

You will finally have a Dairy Tubular because it contains no disks, has twice the skimming force of others, skims faster and twice as clean. Repeatedly pays for itself by saving what others lose. Wears a lifetime.

Guaranteed forever by the oldest and biggest separator concern on this continent.

Ask for Catalog No. 194

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

There is no better medicine made for colds than Chamberlain's Cough Remedy. It acts on nature's plan, relieves the lungs, opens the secretions, aids expectoration and restores the system to a healthy condition. For sale by all dealers.

Read the Advertisements in the Maritime Farmer.

Feed Cows Well When Dry.

I often wonder what many of our farmers are thinking about when they allow their dairy cattle to get so badly out of condition in the winter. The excuse usually is that they are in summer dairying only and can't afford to feed their cows when they are not giving milk. "Can't afford not to" would be my view of the matter. I plan to have my cows freshen in the spring, as it is only in the spring and summer that I have a market for milk, but the feeding I do is not discontinued in the winter.

How can one expect cows to do well when they go on grass if they have to spend all the first month getting a little flesh on their ribs and storing up a little vigor with which to make milk. And by the time the cows are getting in fair, good condition, the pastures start to burn up and the result is the 3,000-pound cow of which we hear so much. It isn't the cow's fault. Under different management she would have produced twice as much milk. I try to have our cows in good condition when they freshen. They then start immediately to pile up a good flow of milk, and come nearer 6,000 than 3,000 lbs. in the factory season.

REQUIREMENTS OF THE CALF.

There is another very important reason why we should feed the cow well in winter. It is then that she is developing her calf. This is a great strain on the cow, and she requires lots of nutritious food. Good food is necessary if we are to have strong, healthy calves.

I find that well matured corn ensilage and well aired clover hay, 30 to 40 lbs. of the former and 15 lbs. of the hay, makes a good winter ration for the dairy cow of average size. I feed the ensilage in the morning and follow with the hay when the mangers have been cleaned up. The cows are then left alone till five o'clock in the afternoon, when they are again fed ensilage and their mangers are filled with oat straw. What is not eaten in the morning is thrown back under the cattle for bedding. This feeding is cheap and it serves the purpose well.

WHEN GRAIN IS FED.

As the time for freshening approaches a little ground grain is added to the ration. This helps in the development of a vigorous calf and gives the cow more strength to do her duty as a mother and at the pail.

We hear much of feeding dairy cows when in milk, and the profit is right in our hands. We need to hear more of preparing the cow for the lactation period, when the profits of feeding are none the less real, but not always so easy to see. My experience has convinced me that the great mistake the most of our dairymen are making is in turning their cows to the straw stack during the winter.—Geo. Coleman in Farm and Dairy.

The usefulness of the dairy cow depends a great deal on tne feed and care she receives in early life. It will be found that the cow with a large stomach capacity and good digestive apparatus will make the most economical use of her feed. To develop this large stomach we must encourage the consumption of bulky food, such as hay, bran, oats, and the like, during the growing period

WINDSOR DAIRY SALT

Every farmer's daughter and every farmer's wife knows

They all use it—for making delicious butter for their own table. They found out years ago that Windsor Butter Salt dissolves quicker, works in easier, and helps butter to keep better.

Windsor Salt is absolutely pure and every grain is a perfect crystal. 42

If you want to get "top" prices for your butter, use Windsor Butter Salt.

LIVE STOCK.

Some Hints on Obstetrics.

The lack of knowledge of owners of live stock in general regarding the simpler laws of obstetrics annually looses them millions of dollars. A cow, a mare, a ewe, or even a sow, may have trouble in parturition at some unexpected moment when a veterinarian can not be summoned and it is necessary that she be given some assistance. Right here is where about one farmer in a hundred is able to proceed with any degree of intelligence. His education along lines of obstetrics has been neglected.

If he knows what is normal and what is not, however, he can be of great assistance and often save both mother and offspring. Nature's plan of delivery of the fetus is to cause a relaxation of the ligaments of the pelvis, the water bag appears through the neck of the uterus, finally appearing outside the vagina. The neck and vagina dilate under the pressure of the fetus which starts through in the shape of a wedge or cone.

There are two normal presentations of the young—anterior and posterior. The nose and two front feet appear in the first with the fetus resting on its sternum, while in the latter the two hind legs and tail appear with the fetus resting as in the first. Variations from these two presentations cause trouble, the difficulty, depending upon the variations from the normal. The cause of trouble may be with the mother or with the fetus, usually the latter.

Premature delivery, narrowness and closeness of the pelvic bones, deformities of the pelvis, tumors within the pelvis, hardening of the uterine neck, closure of the neck or extreme fatness within the pelvis may be some of the causes in the mother. The troubles caused by the fetus are from faulty presentation, excessive size, monstrosities, deformities or dead fetus.

The faulty anterior presentations may be from head doubled back, two feet and legs back, the neck and one front limb, or the neck and both front limbs back. One limb back and doubled at the hock or stifle, both limbs back with one flexed at each of these joints, or both flexed at the same joints are faults of posterior presentation.

To begin with, have a place to work if possible. Some of this kind of work is sure to have to be done on bitterly cold days. If you have the animal in a dry, light place so much the better. This cannot always be had. Get a veterinarian if possible. If you are compelled to do the work alone have plenty of warm water and some linseed oil and antiseptic washes. Have some light, strong cord with loops in the end for pulling, another rope with a hook in the end for hooking into the lower jaw and eye sockets should be handy. An embryotomy knife, a trocar and canula should also be within reach. Wash all tools and ropes as well as the hands with disinfectant before bringing them in contact with the inside work.

Do not interfere until the water bag has ruptured spontaneously unless the water bag has not appeared after several hours of labor pains. If the water bag ruptures spontaneously and the head appears without the feet, or the head and but one foot appears, or if one hind foot presents without the second, or any other evident faulty presentation is apparent, roll up the sleeves and examine. Oil the arm before inserting washing the hands and arm thoroughly first. Have the patient standing, or if lying have head down hill.

When missing members are found straighten and get ready to pull. Work inside while the animal is resting and pull with the strain. Pour plenty of oil in the uterus and rub it on the rough parts of the fetus. When it has lain for some time it becomes dry and does not come easily without oiling. A funnel and rubber tubing will help in getting the oil to the desired parts. In shoving the fetus forward to get a limb straightened a smooth broom stick with a short brad is handy, but the hand must be at the base to guard against injuring the inside of the animal in case the handle slips off and tears the lining. Blood poison may easily set in. When one member is secured and another is sought make sure of your progress by slipping one of the cords over the end. If the patient will not stand keep her lying on the side opposite to where the missing member is sought.

If dropsies of the fetus cause the trouble it may be tapped and the water let off the brain, stomach or skin and the removal of the fetus will be greatly facilitated. Gass accumulates in a dead fetus and can be removed in a similar manner by tapping the body with a large trocar having a rubber tube attached.

Often it will be necessary to remove a limb in order to get the fetus away. Take the limb that is presenting and draw it out as far as possible, slitting the skin from as near the body as possible to the pastern. Peel the skin back from the limb, using the fingers, then cut the muscles at the top, and by twisting and pulling at the same time, the limb can be removed in one section with the skin left as a protection to the mother from the bone and as a handle on which to pull. There is rarely need of removing the head. With one limb out of the way the fetus can nearly always be taken away with little trouble.

Disinfect the uterus of the cow with a three or four per cent. solution of some standard dip and give the mother extra care as regards feed, water and stabling.

That Loose Bull.

There has been considerable agitation and much talk, profane and otherwise, concerning the loose bull nuisance and our Department of Agriculture has done lots of hard thinking in an endeavor to evolve a suitable law to cover the case.

Up to date no very important changes have been made in the old law which provides that any one finding a bull at large may take him up, notify the owner and charge him $5 for his trouble, together with 25 cents per day for the bull's keep. If after three days the owner fails to settle and take away the bull, a Justice of the Peace is notified, who calls a public sale of the animal, after duly advertising it. The proceeds of the sale, after deducting the above charges, besides Justice fees, advertising, etc., are turned over to the former owner.

While this law is by no means perfect, it seems to be about the best we are likely to get for a while, so it is up to us to make the most of it.

If we would all go right at it and enforce the law, as is the duty of every right-minded citizen instead of standing off in thin-skinned terror lest we offend our neighbor, and become unpopular, the trouble would soon cease. But so long as only one or two men in a neighborhood have sand enough to shut up a bull, those men run a very good chance of making enemies and the law is still winked at; whereas if every stockman would do his duty, the very idea of letting bulls run loose would soon become as unpopular as that of stealing or any other violation of law.

Suppose, for instance, you are raising purebred hogs and have a nice, thrifty bunch of pigs. Some fine day your neignbor drives up to your place with a wagon load of miserable little scrub pigs, unloads them into your pen, loads up your good ones and drives off.

Of course, you would not think of stopping him. Oh, no! You might offend him.

But so far as you are concerned where's the difference? His scrub bull comes along, takes away your chance of a purebred calf and leaves you every chance of a scrub in its place.

The man who lays himself open to the charge of giving offense is the one who lets his bull run loose, not the one who takes him up. Of course there is room for a great deal of tact in exercising your rights in this matter.

A great deal more good will generally be accomplished by laying the case before the bull owner in a reasonable way, presenting your side of the case to him rather than by going at it roughshod.

A method that worked pretty well in this neighborhood was as follows:

A copy was made of the law relating to estray bulls, and underneath it "We the undersigned hereby agree to enforce this law in this neighborhood."

It was then taken round to every stock owner in the neighborhood and almost universally signed.

Then when a man's bull was shut up he had no kick coming for he had signed an agreement to shut up stray bulls himself.

There were only two men who shut up any bulls but it soon cleaned up the neighborhood and now instead of every man with half a dozen cows keeping for a bull, a calf that did not look like making a good steer, as they used to do in Texas, he takes them to a good bull.

At first no penalties wete exacted, only a promise to keep the bull up in future.

They kept him up, that is he was supposed to stay inside a two wire fence, if he got out he would be taken up and they could go and get him; it was easier than looking for him.

If the captor collected the $5, of course it was said that that was all he shut the bull up for, so to overcome that the following was tried:

A shut up B's bull and notified him that he had done so and that he must "come through" with the money. When B paid it A gave him his own check for $5, payable to the secretary of the local agricultural society, and told him if he mailed that he'd know where his money had gone.

In another case A shut up C's bull and notified him the same way. C demurred at the $5, saying he was going to castrate the animal anyway. "All right," said A, "come over and I'll help you castrate him before he leaves the place. All I want is a guarantee that he won't bother me any more." And he did.

Castration in the case of nine-tenths of the bulls that are allowed to run at large is missionary work pure and simple, and should always be helped along.—Farm and Ranch.

Sheep on the Farm.

A great deal has been said, and said rightly, on the subject of the advantages of keeping sheep on every farm. The sheep has several good points in which it excels all other domestic animals, and consequently it is to the benefit of every farmer to keep them. It is a refined animal, and not a gross feeher, so that there is not the great amount of labor that attends the growing and fattening of the hog for example. Then too he is a close grazer, and will find a good living where other animals would starve. He will get fat on weeds which would otherwise tax the land heavily. Grains and herbage that would otherwise be lost do not es-

Advantages of a Good Pasture-Replace by Using

cape the sheep. These are all powerful argument in favor of keeping sheep on the farm, and there is no doubt at all as to the profit which they return for a little trouble bestowed on them. Men who have kept both hogs and sheep have expressed themselves emphatically in favor of sheep, saying that they yield a much greater profit in proportion to the attention they require, which is far less.

It is a good thing to start with pure-bred sheep, and to keep up this standard, but failing this, a start with grade ewes is better than no start at all. Pure bred rams should always be used.

The Live Stock Associations.

A number af the various Live Stock Associations operating within and without the folds of the National Live Stock Records held their annual Conventions at Toronto and Ottawa last week. The reports given by the officers of the various associations spell "progress" in their respective lines.

THE HOLSTEIN FRIESIAN BREEDERS.

S. A. Logan, presided at the Holetein Friesian Association meeting which received reports of the most successful year in the history of the Society. The membership now numbers over one thousand and the finances are stronger than ever before. 532 tests were accepted in the Record of Merit during the year. 5924 animals were registered in 1911 and 1912. The total number of bulls now registered is 12,936 and registered cows number 18,961.

A committee was appointed to confer with the National Record Association to determine on what basis they will receive the Holstein-Friesian Society in the Association, and what profit this will be to the Holstein-Friesian Society. The report of this committee will be received at the next Annual Meeting.

The following resolutions were passed:

If an Holstein Cow wins the grand championship at any winter fair she receive an additional prize of $50.

That the grant to the Dominion Cattle Breeders' Association of $150 for 1912 be given under the same conditions as before.

That $5 per cow be paid to any member up to the extent of $25 during a seven or thirty-six day test.

That a grant of $50 be made to British Columbia.

In the list of grants to fairs St. John and Halifax each get $75, Charlottetown gets $50 and $25 for a milk test and Amherst Winter Fair $225. The secretary's salary was increased to $2000.

At the conclusion of the business a nearty vote of thanks was tendered the retiring president, Mr. S. A. Logan who was untiring in his efforts during his term of office to promote the interests of the Black and White Cow.

At the annual banquet, Hon. Martin Burrell, Minister of Agriculture for the Dominion, Prof. Grisdale, Prof. H. H. Dean and G. A. Putnam were the principal speakers.

The officers for the ensuing year are:

President—J. S. K. Herrick, Abbotsford, Que.; 1st Vice-President—J. Rettie, Norwich, Ont.; 2nd Vice-President—R. F. Hicks, Newton, Ont.; 3rd Vice-President—D. C. Flatt, Millgrove, Ont.; 4th Vice-President—M. L. Haley, Springfield, Ont.; Secretary and Treasurer—G. W. Clemons, St. George, Ont.; Directors for two years—S. A. Logan, Amherst, N. S. and J. Mitchener, Red Deer, Alberta; Directors for one year—Neil Sangster, Ormston, Que and J. W. Richardson, Caledonia, Ont.

THE AYRSHIRE BREEDERS.

The membership of the Ayrshire Breeders' Association numbers 785. Registrations during the year have increased by 438 and transfers by 175. The finances increased by $1374.36 during the year.

St. John and Halifax exhibitions will each receive $50 grants and Charlottetown will receive $25.

The members are enthusiastic over the progress that the rustling, hustling Ayrshire cow is making in all parts of Canada and the respective breeders are ready to maintain the standard of excellence already attained.

At the annual banquet, Prof. Arkell, Prof. Day, W. L. Smith, J. Lockie Wilson, Dr. Tolmie and Mrs. W. F. Stephen were the principal speakers.

Among the numerous resolutions passed were the following:—

A resolution was passed asking that Dr. Rutherford be retained at Ottawa, and a committee formed to wait on Hon. Martin Burrell, Minister of Agriculture, asking that mea-

Farmers
Ought to Know
That MOLASSINE MEAL
Is the only Stock Food Containing Molasses that can be fed freely to horses, cattle, sheep and pigs without fear of injury.

IT IS NOT A MEDICINE, REMEMBER, BUT A PERFECT FOOD made from an English moss, to which has been added the STRONGEST and BEST that the VEGETABLE KINGDOM HAS TO GIVE for producing in cattle more and better beef and larger quantities of richer, creamier milk. Fed to sheep, it makes better mutton and a higher grade of wool, while in hogs, it ensures choicer pork and more of it. Horses fed on MOLASSINE MEAL are stronger, healthier, stand more hard work and their coats are always fine, soft and glossy.

IT IS CHEAPER to feed your live stock on MOLASSINE MEAL, because THEY BRING THE BEST PRICES, and are READY FOR MARKET SOONER.

THE HORSE.

Glanders in Horses.

Glanders is one of the oldest known diseases affecting the horse. It is a contagious disease, caused by a particular germ; it occurs in horses and mules, and occasionally in man. It is not a highly contagious disease; it requires rather close and usually prolonged contact to cause its spread. There is on an average of less than thirty cases reported each year in this state and these are nearly always brought in from the western states. Recently there has been an unusual number reported. The danger arising from glanders is often grossly exaggerated.

Glanders is a disease that affects the lymphatic glands of the respiratory system and internal organs and of the skin. When the disease affects the glands under the skin it is frequently known as farcy. The disease may be acute or chronic, that is, run a course from a few weeks to several years.

The disease presents a variety of symptoms depending upon the part involved and the severity of the attack. If acute and involving the nasal and other respiratory passages, there is profuse nasal discharge, with early development of ulcers upon the nasal membranes, usually beginning above and extending downward. One side is likely to be involved more than the other. Hemorrhage from the nose is not unusual. The glands between the angles of the jaw become enlarged. The lungs may show involvement by more labored breathing, shortness of breath and cough; the body shows a rise of temperature, loss of flesh and exhaustion. In the chronic form, there is usually light discharge from the nostril which may be increased at times. The ulceration at first is usually too far up to be readily seen, and when the ulcers are visible they appear to heal and then break down again. The glands between the jaws are nearly always somewhat enlarged and harder than normal. The lung involvement may be so gradual as to present no marked symptoms, or to give the effect of lack of thrift and an occasional cough.

In farcy, the glands underneath the skin become involved, enlarge, and break down with the formation of an open ulcer. In the acute cases, the whole series of lymphatic glands of one or more legs or on almost the entire body may become involved and break down, giving a most disgusting appearance. The animal has a temperature and rapidly becomes emaciated. In the chronic farcy, the glands become enlarged more slowly, only a few are affected at a time, and the ulcers heal after a little time. There is often more or less stocking of the legs and this may be temporary or persist. Cuts or injuries do not heal readily, although the animal may look well. It is from the chronic forms that contagion is especially liable to be spread because the disease goes unrecognized. The disease is one that will not respond to treatment and affected animals should be killed at once.—From Bulletin No. 113, Purdue University.

The Saturation Theory.

The theory of saturation in breeding is ably discussed in an English publication as follows:

The theory of saturation is one which, partly no doubt owing to its incorporation in a book on breeding race-horses, has obtained world-wide credence. In the words of Mr. Bruce Lowe, the prophet, if not the propounder, it is defined as follows:—"Briefly put, it means that with each mating and bearing the dam absorbs some of the nature or actual circulation of the yet unborn foal, until she eventually becomes saturated with the sire's nature or blood, as the case may be." This theory is so nearly identical with that of telegony, or the influence of the previous sire, that we may as well take the two together. Telegony is, as a rule, considered to be the result of influence on the germ cells alone, whereas the definition of saturation implies an actual change in the organs and tissues of the dam. That the first sire, or a previous sire, does exert some influence on the future progeny of the female is universally held and acted upon.

Farmers all over the country firmly believe that by putting a mare first to a thoroughbred they insure "quality" in her future progeny by a heavier sire. Among all classes of breeders, too, the belief that the production of a mongrel or crossbred will spoil a female in future for the pure breeding of her own kind is strongly held. Many instances of the appearance of puppies resembling previous sires could be quoted, but we do not attach much importance to these so-called authentic cases, all drawn, curiously enough, from the kennels, because, owing to the peculiar habits of the dog, the paternity of a litter is often open to doubt. The whole matter is of such interest and importance to naturalists and breeders, and has so recently been the subject of investigation and controversy, that a repetition of the story of the origin of the modern belief in telegony may not be without interest.

In 1820 Lord Morton communicated a singular fact in natural history in a letter to the president of the Royal society. Being the possessor of a male quagga, he mated him with a young chestnut seven-eighths bred Arab mare which had never been bred from before.

The result was a female hybrid. The mare subsequently passed into the hands of Sir Gore Ouseley, who bred from her on two occasions by a very fine black Arabian horse a colt and a filly. These colts are described and pictured as having the character of the Arabian breed, but both in their coloration and in the hair of their manes they bore a striking resemblance to the quagga. Both were bay and possessed dorsal stripes across the shoulders and dark bars across the back part of the legs, and their manes were said to be entirely or partially upright. This seems conclusive proof enough, as far as it goes, that the quagga had "infected" the seven-eighths-bred Arab mare, and until recently it was accepted without question. One point, however, is worth investigation. Could the "very fine black Arabian horse" have been pure bred? It is generally held by those most qualified to judge that such a thing as a pure black Arab does not exist. If this is so, the colts produced by the chestnut mare may have been thorough mongrel instead of fifteen-sixteenths Arabian blood, in which case reversion, or the reproduction of an ancestral type of coloration, would not be surprising. In any case, with this lapse of time, we must not pin too much faith to this example of apparent telegony as proof of the soundness of the doctrine. Such authorities as Captain Hayes, Spencer, Romanes, and Darwin believe more or less firmly in the influence of the previous sire, while against them we find the opinion of Professor Ewart, Weismann, and a number of German breeders.

One would have thought that definite information would have been obtainable from mule breeders in the United States and France, but some accept the infection of the germ theory, while others affirm that they have never seen any evidence of its influence. It is suggestive that, as a rule, certain mares are kept specially for mule breeding alone, and are seldom, if ever, allowed to breed their own species after producing a hybrid.

The thanks of breeders are certainly due to Professor Cossar Ewart, of Edinburgh, for his enterprise in endeavoring as nearly as possible to repeat Lord Morton's experiment. The quagga being extinct, a Burchell's zebra took its place and was mated with a number of mares of different varieties. In some cases the hybrids were the first born of their dam; in others the mares had been bred before. All the mares were subsequently mated with horses, and it might be supposed that if telegony is of such constant occurrence as breeders would sometimes lead us to suppose, some, at any rate, of the progeny of these mares would show signs of the influence of the previous zebra sire. The results were, however, of an entirely negative nature, and the foals produced no characteristics which could not be ascribed to reversion. The result of these experiments has dispelled all belief in the doctrine among scientists, even if it still continues to exist in the popular imagination.

The fact is that many of the strange results which fall to the lot of every breeder are due to reversion, or the appearance of a youngster in the guise of a more or less remote ancestor. Ignorance of the ancestry of the animals we are breeding leads us to attribute these variations to some mysterious cause instead of to the true one, with the result that these strange beliefs get credited and spread among our equally ignorant friends. Every breed of animal has a tendency to produce young with one or more of the primeval characters, but it is only when we have taken the trouble to study the early his-

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:
SPLINTS

After Using

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR :--I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

Hillsboro, N. S.

MESSRS FRASER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

HAD VERY BAD COUGH

And Tickling Sensation in Throat.

Dr. Wood's Norway Pine Syrup Cured It.

Miss C. Danielson, Bowsman River, Man., writes:—"Last fall I had a very bad cough and a tickling sensation in my throat. It was so bad I could not sleep at night, so I went to a druggist and told him I wanted something for my cold, and he advised me to try Dr. Wood's Norway Pine Syrup which I did, and after taking one bottle I was completely cured. Let me recommend Dr. Wood's Norway Pine Syrup to anyone who suffers from a cough or throat irritation."

Dr. Wood's Norway Pine Syrup is without a doubt one of the greatest cough and cold remedies on the market to-day, and so great has been its success there are numerous preparations put up to imitate it. Do not be imposed upon by taking one of these substitutes, but insist on being given "Dr. Wood's" when you ask for it. Price, 25 cents a bottle; put up in a yellow wrapper; three pine trees the trade mark; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Seldom See a big knee like this, but your horse may have a bunch or bruise on his Ankle, Hock, Stifle, Knee or Throat.

ABSORBINE

Before After will clean them off without laying the horse up. No blister, no hair gone. $2.00 per bottle delivered. Describe your case for special instructions and Book 8 F free.

ABSORBINE, JR., liniment for mankind. Removes Painful Swellings, Enlarged Glands, Goitre, Wens, Bruises, Varicose Veins, Varicosities, Old Sores. Allays Pain. Price $1 and $2 a bottle at druggists or delivered. Manufactured only by W. F. YOUNG, P.D.F., 124 Lymans Bldg., Montreal, Ca.

Dollar Bottle Free

tory and palaeontology of the variety in which we are interested that these variations become pregnant with interest and meaning. As we shall touch upon the subject of reversion further on, we will bring this subject to a close with the assurance that the influence of a previous sire, if it does occur, is of so rare an occurrence that it need never be taken into consideration by breeders, and that no mare should be discarded for the future pure breeding of her own kind because she has bred a colt of another variety or even a hybrid. Furthermore, the futility of putting a mare first to a thoroughbred with the idea of influencing her subsequent progeny will be readily understood.

The experiments made in crossing horses and other animals have equally failed to support the saturation theory. No evidence is forthcoming that any female animals are liable to be saturated with the "nature or blood" of the males to which they repeatedly bear offspring.

Foot Markings of a Horse.

How many are there who can describe the foot and leg markings of a horse correctly? The "white-foot," the "zebra stripes" and the "arborizations" are the names used by horsemen who can correctly describe a horse foot markings.

White-feet are described in relation to their number, the extent, form and composition of marking. In describing the marking of a horse with one white foot the member is mentioned. For example, "white-foot, anterior left." Two white feet are identified by "white-feet, right lateral biped," "left diagonal biped," etc. Two white-feet are necessarily diagonal or lateral. Where three feet are white the unmarked one is isolated, as "three white-feet, posterior left." Four white feet needs only the character of the markings for identification.

The extent of the markings are designated by "incomplete" if the member is not completely circumscribed; "interrupted" if the course is broken by black or colored hairs or is not continued to the extremity of the member; "trace of white-foot" when it occupies only a small portion of the coronet; "beginning of white-foot" when the region of the coronet only is involved, it being surrounded; "small white-foot" when the coronet and the pastern are surrounded; "white-foot" when it extends to the hock; "large white-foot" or "half-stocking" when the marking reaches the middle of the cannon; "stocking" when it extends to the knee or the hock; "high stocking" is still higher, extending onto the forearm or the leg, and the "very high stocking" which reaches the vicinity of the body.

As to composition the white-feet may be "bordered," "speckled," "ermined," "trout-spotted," "mixed" or "marbled." The white feet of gray horses are mentioned only when the markings are perfectly apparent. "Bordered" is circumscribed by a mixed border; "speckled" is mixed with black points; "ermined" has larger black points; "trout-spotted" has red specks in the body; "mixed" looks as though the base of the coat were mixed with the white hairs that compose it, and "marbled" is seen when dark splotches and spots similar to those of the leopard are in the body of the white.

Zebra marks are dark sinuous lines directed transversely upon the arm, leg, knee, cannon, and hock. These are seen most frequently on sorrels and fawn colored horses.

Arborizations are the same as zebra marks, with the difference that white hairs are used in their formation. They are located on the outside of the forearm, the legs and the backs of the ears. The color of the coronary band determines the color of the hoof. It may be white, black or mixed.

Gombault's Caustic Balsam

The Worlds Greatest and Surest Veterinary Remedy

HAS IMITATORS BUT No COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for

Heaves of Three Years' Standing Completely Cured by

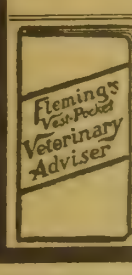
Fleming's Tonic Heave Remedy

So says Mr. H. B. Burkholder, Lillooet, B. C., writing about Fleming's Tonic Heave Remedy, and adds, "I also find it the best condition powder I ever used."

Heaves is not, as commonly supposed, a disease of lungs or air passages. It is due to stomach trouble, which, through the close nerve connection, causes a contraction of the lung tissues, and labored breathing.

Fleming's Tonic Heave Remedy corrects the stomach troubles, and tones up the whole system. Its cause gone, the heaving stops.

As a general condition powder, Fleming's Tonic Heave Remedy has few, if any, equals. Sent, postpaid, for $1.00 per package.



We believe this is the best book ever printed for the distribution. It was over 200 Veterinary subjects including how to prevent various diseases and blemishes and how to cure them.

It is free for the asking—write us for a copy. 6

Fleming's Lump Jaw Cure—the first successful Lump Jaw Cure—today the standard treatment.

Fleming's Spavin Cure—Liquid—cures soft and semi-solid blemishes without scarring.

Fleming's Fistula and Poll Evil Cure—enables anyone to readily cure cases considered incurable.

Fleming's Spavin and Ringbone Paste—one or two applications cure cases of years' standing.

POULTRY.

The Turkey and What He Can Do For the Woman on the Farm.

Editor Maritime Farmer:—

I imagine the majority of us have had enough turkey talk of late, in the newspapers,—but fortunately the following has nothing to do with "The Unspeakable Turk" or "The Sick Man of Europe."

As a starter, why in time don't every farmer's wife, who has land enough to fling a cat around without touching the fences, raise turkeys? All we are absolutely sure of is the fact that they don't keep them, and that settles it. In the majority of farming communities the flocks of these profitable birds are so insignificant, and of such poor quality as to hardly be worth serious consideration. If you would know the reason why this condition obtains the first serious objection that presents itself is: "They are so hard to raise." So are ducks and chickens. Personally I have had far more trouble with the latter than I ever had with turkeys.

When it comes to anything fussy, mussy, and hard to raise, how does a little calf strike you? I have never generated much thought, correspondence, or talk on the subject, but I know I would rather take care of 50 turkeys and 50 geese than cater to one of the mussy little things. With the calf his right to be or not to be has never been called into question; because the cow and her offspring is for the farm, and the farm for the cow, as much indeed as for the farmer and his family themselves. The same should be true of turkeys. If the cow was intended for the farmer, the turkey by a special dispensation of providence, that takes cognizance of the eternally feminine and her infinite variety and her manifold needs and necessities, the extent of which rarely dawns on the average man. I say the turkey, capricious bird that he is, was especially designed for the farmer's wife and her daughters, daughters, forever and ever, Amen, and so be it. With less than one third the patience and about half the good honest energy required in the mothering of the race a woman can do anything within her strength from raising turkeys to voting.

Another objection and a serious one: "They wander all over the place; they won't stay on the property." I am convinced this is merely a bad habit. If your turkeys insist on calling on your neighbours at all times and seasons, teach them better manners. I realize this is easier said than done; but at this writing we have a flock af turkeys, that have never, to my knowledge, been out of sight of the house. The only magic we ever worked on them to achieve this happy result, was in the shape of a good feed once a day, in the morning. That is important, and don't be in a hurry about running out before light. Along in the morning, say nine or half past will do, and when they are once fed that will largely curtail their desire to roam for that hay, as they will merely go a little way to find some grass hoppers and enough greens to balance their ration; and they will roost at home, to be in good time, and on hand the next morning when the treat is passed around. Of course this is applicable to the young birds. I know the worst offenders are the old breeding stock. If you have old hardened rovers of hen turkeys, that insist on stealing their nests far from home, in the most unheard of and inaccessible places, cut their heads off; life is too short to bother with them. Anyway turkeys should be absolutely under control, and should not be permitted to make their own nests and lay and set, wherever and whenever they chose. This is not only a slipshod way in which to attempt to do anything, but wasteful to say the least.

A turkey hen will always lay two or three eggs after beginning to set. Of course the first eggs will hatch, when she will wander off with her brood and leave the latter eggs. I have had such eggs hatch under domestic hens three days after the flock was out of the nest.

The turkey is a despot, a veritable Turk. Before now I have wondered at his timerity as he monopolizes the feed dish, while his patient, long suffering wives take surreptitious bits when they deem it safe to approach near enough. I have witnessed this

(Continued on page 357).

One of the most successful turkey breeders I know anything about is a woman, the extent of whose egg trade alone would make some of our pessimistic farmers sit up and take notice. She has solved the problem of the delinquent hen turkey by means of a coral. Thisis no more than an enclosure, with some small but dence low growing evergreens where barrels were fixed on there sides, around in obscure corners and if one hen can be induced to lay in a barrel nest, the others will follow suit and all will probably select the same barrel. In this way she could collect fresh eggs each day for her egg trade. After she gathered the eggs she fed the flock inside the coral and let them out later, to wander at their own sweet will.

In starting to raise turkeys, the first thing to consider is the health of the flock from which one selects breeding stock. If the breeder has lost a good many before they "shoot the red," (or before their sixth week) avoid them as you would the plague otherwise you will surely purchase trouble for yourself. Avoid petted and pampered birds; a little petting goes a long way with a turkey. If you want something to pet get geese, or get a husband, or if you are already have one pet him and the first thing you know you will begin to find him worth petting and delectable as you thought he was when you married him.

But, seriously, nobody would ever want to pet a turkey. There is nothing very lovable or admirable about him, excepting, as ne is borne in and placed before one delightfully brown and stuffed with good things, during the holidays when no fault can be found with him, shorn of his ridiculous strut and arrogance; we feel that his presumption has received but its just reward, and we "fall to" without a qualm. I never sit down before a murdered goose without feeling like a cannibal.

INVINCIBLE FENCING

Like the invincible, thoroughbred British Bulldog, never lets go. Its locks, stays and strands are of the hardest, strongest, toughest, best galvanized open hearth steel wire ever used in fencing. They embody in zinc-clad, rust-proof steel, the invincible qualities of that famous breed of dog which never relaxes its hold.

Invincible Fencing

From first to last, from ore to finished product, INVINCIBLE FENCING is Canadian made and Canadian quality, intended for Canadian trade. The Steel Company of Canada wants the patronage of Canadian fence buyers and intends to get it by supplying a product which in quality and value cannot be surpassed.

Invincible, Hot process Galvanized Gates, galvanized after made, absolutely lead the world in quality. They are the final word in the art of gate making.

Our agency is without exception the most desirable fence line for the future in all Canada. Write at once.

FREE

Handsomely Decorated Dinner Set

Ladies. We will give you this beautiful full size dinner set absolutely without cost.

This is the Chance of a Lifetime. An Honest Proposition.

We will give away free 1,000 of these handsome dinner sets, beautifully decorated, each set 58 pieces, latest designs, handsome patterns, full size, for family use. A magnificent and complete set to quickly introduce and advertise Dr. Burdick's famous New Life Vegetable Pills,—the wonderful remedy for indigestion, constipation, unhealthy blood, rheumatism, to stimulate the appetite, regulate the bowels, and clear the complexion, an invigorator, tonic, and life builder. We will make you a present of this handsome set, exactly as we claim. Take advantage of this if you want to get a handsome set of dishes for your home, absolutely free.

All We Ask You to Sell is Only 12 Boxes at 25c a Box

of Dr. Burdick's famous New Life Vegetable Pills. Being determined to gain a national reputation as the most progressive firm in Canada, and to gain a wider distribution of our strictly pure, high-grade remedies, we are going to assist you to sell our medicine, and to earn this beautiful set quickly by sending with each box of pills a certificate by which every purchaser can receive from us a Handsome Box of Presents consisting of 1 handsome solid gold shell ring, plain engraved, and chased or set with beautiful sparkling jewels, equalling in appearance the finest diamond rubies and sapphirs, etc., 1 sacred Resurrection Plant of Egypt—The Rose of Jericho as spoken of in the Bible; 1 pair gentlemen's imported Lever Cuff Links, Gold finished, your choice of a handsome Silver finished Sugar Shell, silver finished Butter Knife or Silver finished Pickle Fork; one cabinet photograph of our King in his royal uniform, and our Queen in full court dress. This magnificent box of presents, exactly as described, we will send fully prepaid to every one who purchases a box of our medicine from you, and will return us the certificate with only 50c. to cover cost of packing, mailing, etc., the different articles. Our object in making this wonderful offer is to introduce people to try our medicine, and to receive the opinion of every purchaser, and this we will get when the certificate is signed and returned to us. This liberal offer makes it impossible for you to fail. Your friends will be delighted with this wonderful opportunity to secure a handsome box of presents.

Don't miss the opportunity of a lifetime. Write us to-day and agree to sell only 12 boxes, and return the money, only $3.00 to us. We trust you with our medicine till sold. As soon as your remittance and the certificates have been returned to us, we will promptly ship the dinner set to you. We arrange to stand payment of all freight charges to your nearest station. We are bound to introduce Dr. Burdick's famous medicine no matter what it costs us and when we say we will give away these handsome sets of dishes, we will do it. **Our methods are honest. Don't miss this great opportunity.** Write to us at once. Address.

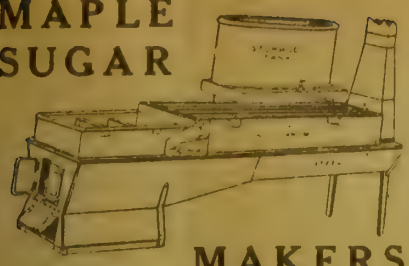
MAPLE SUGAR



MAKERS

The Lightning Evaporator is not only the fastest one made in the world, but it holds more prizes, medals and diplomas for quality of syrup it makes than all the other makes put together. Write for catalogue, it is free and gives lots of information.

SMALL BROS. - Dunham, Que.

A SPEEDY CURE

Kentville, N. S., January 1st, 1910.

Messrs. C. Gates, Son & Co.,

Gentlemen,—This is to inform you that I have been a sufferer for the last fourteen years from kidney and stomach trouble, brought on by severe colds. Having been laid up every winter during that time. Last year I was laid up for seven months, so that I could not go out of the house. Dropsy set in, and my stomach swelled so that I was six inches larger than my usual size, had two doctors in attendance, but I grew worse and they were going to tap me—my friends despaired of my life. At this time I was recommended to use

Gates' Life of Man Bitters and Invigorating Syrup No. 1.

and in one week after commencing their use, my size was reduced two inches, and in four weeks was reduced to my usual size, so that I went to work in my mills, and have been able to continue it ever since. By continuing the use of your BITTERS and SYRUP, I hope to get a cure of the kidney and stomach trouble so far as it is possible, as it always helps me when I take it. You may make these truths known for the benefit of sufferers.

Yours very gratefully,
John W. Margeson.

Infertile Eggs.

One of the greatest losses in the poultry yard comes from the lack of fertility and hatchability in eggs used for hatching. We always expect to get out a large number of early chicks, but one thing and another delays, and then when hatching times comes, to find dead germs and chicks dead in the shell, instead of the nest full of chicks, is both disappointing and unprofitable.

To secure fertile eggs, breed from vigorous birds only. We should not expect to get strongly fertile eggs from birds which have been fed and forced for eggs during the fall and winter. A hen can be so worn out by egg production that it is impossible for her to produce hatchable germs.

Breeding birds which begin the work of egg production near the time the eggs are required for incubation will ordinarily give stronger germs and better chicks than can be obtained from hens which have been laying for months.

Some breeders claim to get their best stock from April or May hatched pullets which have been kept back from egg production until nearly time for setting eggs for incubation.

It may be that the reason eggs from hens will hatch, as a rule, better and stronger chicks than eggs from pullets is because the hen does not begin egg production as early in the year as does the pullet, and is in better condition for laying hatchable eggs.

Lewis Wright once said: "It does not seem quite sufficiently recognized that the hens need conservation of their breeding powers as well as the cocks, and should be equally considered in relation to the time when their eggs are desired for hatching."

A great aid in securing fertility is an abundance of wholesome feed. We do not believe in soft mashes seasoned with stimulants for breeding birds. Feed sound grain in litter, give animal food, snell-making food, green food, fresh water, pure air and exercise, and the eggs have every chance for hatchability.

Don't underestimate the importance of exercise for the breeding pen. It is a great mistake to pen the best birds and expect them to give fertile eggs when they should have range and exercise to give vigor to their young and themselves. Far better house the layers, and let the breeding stock run. Confinement with proper feed does not seriously interfere with egg production.

Do not mate too many females with one male early in the season. Do not trust to the service of one male only if it is possible to secure a full brother or a bird of similar type to use with him. Where but one male is kept for each pen, if an accident happens to him, or if he refuses to notice some of the hens, the loss in breeding operations is serious. It is difficult to secure a good breeding male late in the season, so hold one or more in reserve. Two birds nearly related, or of the same type, will make a safer mating used alternately than one male used constantly. See that the male gets enough to eat. A good plan is to coop him at night and feed him by himself in the morning.

There is almost as much danger in under mating as in over mating. Do not leave a male with two or three hens for the entire day. Put him with them for a few hours in the morning or evening only, if fertility is poor. A very vigorous bird may give better fertility with a number of hens than with a few.

Even when yard mating is practiced do not have too many males out at once. The interfering attentions of several male birds is responsible for much infertility. Keep some of the males housed on alternate days out of sight of the females, and feed well.

Exercise and Laying Hens.

One of the greatest reasons that hens stop laying in winter is that they do not get enough exercise. If a hen is let alone she has a tendency to go into a hibernating state as many other animals do in winter. If she can be kept out of this her producing qualities as a layer will be equally as good as in more favorable times of year.

A hen should be made to take exercise. One of the best ways to get her to do it is to hang a piece of meat, fresh every morning, by a cord about a foot from the floor. They will jump to peck it and thereby gain the desired exercise necessary for them. This has been proved to be more successful than sprinkling grain in chaff for them to scratch in, yet they both work well together.—John E. Taylor, Maine.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

A Sermon in Rhyme.

If you have a friend worth loving,
Love him. Yes, and let him know
That you love him, ere life's evening
Tinge his brow with sunset glow.
Why should good words ne'er be said
Of a friend—till he is dead?

If you hear a song that thrills you,
Sung by any child of song,
Praise it. Do not let the singer
Wait deserved praises long.
Why should one who thrills your heart
Lack the joy you may impart?

If you hear a prayer that moves you
By its humble, pleading tone,
Join it. Do not let the seeker
Bow before his God alone.
Why should not your brother share
The strength of "two or three" in prayer?

If you see the hot tears falling
From a brother's weeping eyes,
Share them. And by kindly sharing
Own your kinship with the skies.
Why should anyone be glad
When a brother's heart is sad?

If a silvery laugh goes rippling
Through the sunshine on his face,
Share it. 'Tis the wise man's saying:
For both grief and joy a place.
There's health and goodness in the mirth
In which an honest laugh has birth.

If your work is made more easy
By a friendly, helping hand,
Say so. Speak out brave and truly,
Ere the darkness veil the land.
Should a brother workman dear
Falter for a word of cheer.

Scatter thus your seeds of kindness,
All enriching as you go—
Leave them. Trust the Harvest Giver
He will make each seed to grow.
Lo, until its happy end,
Your life shall never lack a friend.

Love's Barrier.

(Continued from last issue).

CHAPTER XVIII.

THE THUNDERBOLT.

"Another letter from Audrey!" said Secretan teasingly. "She is a most faithful correspondent."

"I shall read it presently, when I have attebded to the children. Margot, you must eat that porridge," said Helen, with a quiet, compelling glance at a small, very red and rebellious face, framed by dark curls, sitting at her right side.

"Shan't," said Margot decidedly. "Nasty stuff."

"You know you like it quite well, but you have risen from your bed cross," said Helen quietly. ;'If you don't wish any breakfast, you can go out of doors. You are not to go to the kitchen, remember, and disturb Betty at her breakfast."

"I want some bacon and eggs. Can't I have bacon and eggs, Uncle Claude?"

Claude would have melted, but Helen was firm.

"After you have eaten some porridge."

"Mamma never made us eat porridge; she thought it was horrid stuff, and said it would spoil my complexion."

"I didn't know you had a complexion, Popsy," said Helen serenely. "Come, darling, just this little sauc- erful. Auntie Helen means it, you know; and then, if you wish it, you can have one rasher of bacon and a whole poached egg."

"Eat it, Pops," said Geoffrey commandingly. "You know you like it quite well. It's just pure cussedness."

Secretan himself rose and came round to the wilful child's side, and, taking up the spoon, offered to feed her, making a few joking remarks to her at the same time. She became instantly obedient, and swallowed what he offered without further protest. Helen smiled a little, even while she pretended not to notice. She loved to see Claude with the children, who were wax in his hands. However tiresome the mood, he could melt it and bring them to reason and sunny good will. Helen was not so successful. She was not naturally fond of children, and while she was most kind to them, did not always make sufficient allowance for their childish ways.

They had now been three weeks at Midcar, and were in the seventh heaven of delight. They spent their entire days upon the moor, often picnicking there from dawn till dusk, in charge of the faithful Betty, who, restored to the company of her beloved Miss Helen and her scarcely less adored Jimmy Bates, was almost tearfully happy. Hannah, fully awake to a sense of the responsibility resting on her as the acknowledged head of the Rectory kitchen, had developed all sorts of undreamed of qualities.

Peace restored, Helen poured out tea, and then opened Audrey's letter.

"Wonderful news, Claude, the child is engaged! Mrs. Hayes has engineered it at last!"

"No! Who is the happy man?"

"She does not mention his name," said Helen, turning the page to glance over it. "That's so like Audrey, she is very inconsequent. She calls him simply Gerald. You must read the letter. It is a sort of girlish rhapsody. I wish I felt a little more assured about it. This is the seventh week of their stay, and the first letters did not contain any mention of this man; the acquaintance is very new."

"Mr. Hayes is there. Be very sure he would make every inquiry about the man. He will not give Audrey to any Tom, Dick, or Harry."

"I hope he wouldn't; but it is the woman! She is so overpowering, and so inconceivably stupid about some things. I believe she would marry Audrey to any kind of fool so long as he had the necessary worldly qualifications."

"Audrey herself would not marry a fool, dear. She has too large a share of her father's common sense. Well, kiddies, would you like to go? May they go, Helen?"

Helen nodded, still deep in her letter. She's a dear child," she said soberly, as she passed it over. "And I can't say I feel very happy in my mind about it all. Yes, you may read it, it is not private; you will see she expects you will read it."

Secretan spread out the thin sheet before him and read the first outpouring of a girl's heart over a real lover.

"Hotel Krenzenbad, Marienbad.
"August 28th.

"Dearest Mrs. Secretan,

"It was a great pleasure to receive your kind letter, and I am ashamed that I have been so long in replying to it, but the days seem to glide by so quickly here, and I am so happy, that I seem to have lost count of time.

"At first, you know, dearest, I didn't like this place. It seemed full of nothing but very fat and cross-looking people, who had come for the waters, and who all glared at one another as if they grudged the place to anybody but themselves. If papa had not been here to laugh at them with me, I'm sure I shouldn't have been able to stay.

"The place suited mamma from the beginning, and the only person who is really cross now is Tremlitt, mamma's maid, but even she is recovering. The weather is so lovely here, and every day there is so much that is interesting that can happen and that does happen.

"About the middle of the first week heaps of nice and interesting people began to arrive, and we soon got to know some of them, though mamma is very particular. Quite soon after we came she got to know such a nice English lady, and in about ten days' time her nephew came to join her, not for the cure, of course, because he is quite young, but because he wished to be near his aunt, who has been like his mother, and who brought him up. He is a soldier, and has just come home from India, having been there with his regiment. He is frightfully handsome, even handsomer than Mr. Secretan, which is saying a great deal, isn't it? His name is Gerald, and he admires my name so much. He is always telling me that. He was very kind to me from the first day of his coming, and of course, as there are so few really young people here, I was most grateful.

"We went out a good deal together, and papa didn't mind. He likes him. Everybody does. And—well, dearest Mrs. Secretan, perhaps you have guessed the great secret I have to tell you, that I am engaged to Gerald. I haven't got over the surprise of it yet, because I'm only a little country girl, and he is so clever, and his aunt assures me he could marry almost anybody. And I am sure, by the way the women look at him here, that it is quite true. He is not very well off, poor dear, but one day I suppose he will inherit everything from his aunt. Mamma says she is very rich.

"We are coming home soon. Tomorrow we leave Marienbad, and go into the Bavarian Tyrol for about ten days, so that mamma may get a little mountain air. Mamma sends her love, and I am to tell you we expect to be home on the tenth of September, and will you keep yourself disengaged for the fourteenth, when she will ask some people to dinner? Gerald will be with us by then. He is going to London when we leave Marienbad, and will come on to High Ridges after us.

"I don't quite realise this wonderful thing that has happened yet. Can you imagine a distinguished solhier like Gerald caring anything for a poor little country girl like me, though it is because of that he says he likes me. I am very happy, though sometimes a little afraid. I want to get home soon to see you, and have your advice and sympathy.

"Mamma is very much pleased, because she has got rid of poor John Ridd at last. She was firmly convinced that I intended to marry John aided and abetted by papa. Of course I liked John, but I did not want very much to marry anybody. I am getting used to the idea now, however, and I think so is papa. He is walking up and down the terrace now with Gerald. I do so like to see them together. Gerald wants us to be married very soon, but there is plenty of time, I tell him, and he does not know where his regiment will be sent next. Good-bye, dear Mrs Secretan; I have written such a long, long letter, I don't believe you will have the patience to read it. But try, because it is all about your little Audrey.

"How is everybody—Ann Coyne and Lydia, and dear Miss Jane, and the little boys? And have you got the dear children you told me about at the Rectory yet? Mind you keep them till I come. Give the Rector my love, and tell him he must get ready for the very greatest wedding that was ever seen in Midcar Church. You should just hear mamma talk.

"Ever your affectionate,
"Audrey Hayes."

Secretan laid down the letter, and glancing across the table was surprised by the unusual gravity of his wife's face. He was learning to read its every expression in these days, since the new comradeship of affection was established between them.

"Claude, I don't know how it is, but I don't feel happy about that letter," she said, with a little strain in her voice. "It is not quite natural. I have the feeling that Audrey is being sacrificed, after all, to her mother's ambition."

"Nonsense, dear! I'm sure she writes happily enough, just like a girl proud of her first lover. And, as I said, we may safely leave the matter with Mr. Hayes. He will take good care that the man is worthy."

"She doesn't even mention his name; the fourteenth—why, that is next week, isn't it? They will be here quite soon."

"As he is a soldier you may know something of him or his family," suggested Secretan. "I dare say

AFTER SUFFERING YEARS

Cured by Lydia E. Pinkham's Vegetable Compound

Fox Creek, N.B.—"I have always had pains in the loins and a weakness there, and often after my meals my food would distress me and cause soreness. Lydia E. Pinkham's Vegetable Compound has done me much good. I am stronger, digestion is better, and I can walk with ambition. I have encouraged many mothers of families to take it, as it is the best remedy in the world. You can publish this in the papers." — Mrs. WILLIAM BOURQUE, Fox Creek, N.B., Canada.

The above is only one of the thousands of grateful letters which are constantly being received by the Pinkham Medicine Company of Lynn, Mass., which prove beyond a doubt that Lydia E. Pinkham's Vegetable Compound, made from roots and herbs, actually does cure these obstinate diseases of women after all other means have failed, and that every such suffering woman owes it to herself to at least give Lydia E. Pinkham's Vegetable Compound a trial before submitting to an operation, or giving up hope of recovery.

Mrs. Pinkham, of Lynn, Mass., invites all sick women to write her for advice. She has guided thousands to health and her advice is free.

The Nova Scotia "Lumber King" says:

"I consider MINARD'S LINIMENT the BEST liniment in use.

I got my foot badly jammed lately. I bathed it well with MINARD'S LINIMENT and it was as well as ever next day.

Yours very truly,
T. G. McMULLEN.

Do you know that more real danger lurks in a common cold than in any other of the minor ailments? The safe way is to take Chamberlain's Cough Remedy, a thoroughly reliable preparation, and rid yourself of the cold as quickly as possible. This remedy is for sale by all dealers.

Audrey has already told him all about you."

"Think of the hundreds of thousands of soldiers there are in the world. The chances are quite against my knowing anything about him," said Helen; but her tone was unconvincing, even to herself. "Well, shall we go on the fourteenth?"

"Why, of course. You will be anxious, doubtless, to see the future son-in-law."

"I don't mind. I have all I want within these walls," she answered with a sudden touch of passion. Suddenly she stood up and looked across the table with a great yearning in her eyes.

"Claude, you are sure you don't regret? It will soon be a year since that day we met first in the gardens of the Luxembourg. Do you regret all that has happened since then?"

"No, I thank God for it every day I live, but most of all for you!"

She lifted her face to his, received his kiss, and was comforted, but from that moment her anxiety did not sleep. She knew that some crisis was at hand, and that out of the new event which had stirred the placid routine of the Hayes's family life some issue was to arise affecting herself. She did not seek to put her fear into words, or to crystallise her anxiety; rather she put it from her as something she could not bear to face.

"You are worrying yourself about something, Helen," said Jane, who popped in one day, bringing her boys to tea. "These children are getting on your nerves. Let them come back with me to the Court. Tom won't mind, and they can run wild like young colts for a week. The harvest is in full swing, and there are heaps of things to interest them."

"Thank you very much, dear, but it isn't the children. I really don't mind them, and Claude is so good with them, you wouldn't believe it."

"They look different children since they have been here. Pity they have to go back to that lowlying Essex place."

"Colchester is very healthy," said Helen listlessly. "But certainly they might be better looked after than they are. I'm afraid we are in for a visit from Mrs. Revell in a week or two. I'm daily expecting a line from Karlsbad, where she is taking the waters, and Claude will insist that she must come. I believe he expects that some sort of revolution would be worked in her nature if she came here. He is a most ridiculous person."

"Well, he may be quite right, Helen. Happiness is infectious, and of course he is ridiculously happy. I couldn't help telling him last Sunday that he looks more like a boy than ever."

"I want to keep him like that. I didn't want these Colchester children. I don't want their mother. I don't want anything to come in here from the past," cried Helen passionately. "Claude does not understand that; more than ever now I want to be quite done with it."

Jane looked a little puzzled, not exactly comprehending the point of view.

"There! I'm selfish, as usual, talking for ever and ever about myself. How are you getting along, dear? Aren't you tired of the Court Farm yet?"

Jane was silent a moment, leaning back in the low veranda chair, her face wearing a strange look.

"Helen, I hate to say it. It is silly, and it hardly seems decent, but I want to ask you something. I'm afraid Tom is beginning to regard me as something not quite like a housekeeper. It's silly at my age to be thinking or hinting at such a thing, but I'm afraid it's quite true, and that he will want to marry me."

Helen laughed a little hardly.

"Any donkey, as I said to Claude, would have foreseen that contingency. What could you expect when you went there, the only woman about the place, and so delightful as you are? Don't redden so furiously. Does that mean that you are going to accept him?"

Jane sat up very straight in her chair.

"No, it doesn't mean that. I couldn't marry Tom Courtney, Helen, if it was save my life or his."

"I'm so glad to hear you speak so decidedly, because, honestly, I've felt a little afraid. There are no lengths to which a woman like you will not go in pursuit of a mistaken idea of duty."

Jane laughed a little ruefully.

"When it comes to marrying a man oneself, Helen, it makes a little difference. It is a pity, I think, that this sort of thing should intrude everywhere. Why, it interferes with one's proper work. I haven't patience with it."

"Has Courtney taken to stopping in the house, then, to talk to you?" inquired Helen a little amusedly.

"He would do it if he got the smallest encouragement," replied Jane, truthfully enough. "I shall be very sorry if he says anything which would make it difficult or impossible for me to stop on, because I'm really quite happy there, and I love the children dearly. Ann Coyne's niece is a great success as a daily governess, and I think Tom might do worse than ask her to become resident. I've suggested it to him. It would make it more comfortable for me, just at present at least, if there were a third party."

"Yes, it would. I should insist on it, if I were you. A woman like you could easily get your own way in a small matter like that."

"Helen, don't tell Claude about this. It would make me feel so silly, and I should not like to lose his respect."

"Lose his respect, you foolish woman! Why, you would gain more of it. Men are like that, I assure you. It would be excellent for Claude if you had a great many suitors."

"I shall never have that," replied

ESTABROOKS' RED ROSE COFFEE

A Credit to the Name

If you already know Red Rose Tea you will expect much of Red Rose Coffee became of its name alone. Nor will it disappoint you; for it is worthy of its name.

Blended to combine strength and rich flavor, this fine coffee is crushed new-roasted into small grains, and freed from chaff and dust. These uniform grains readily give the true coffee flavor to a brew which pours clear without any sediment. You may expect rare quality from every tin of

Jane, quite literally and soberly. "And, of course, it is only because Tom is grateful to me, and because he feels lonely, and I have tried to take an interest in him, especially about the drink. He hasn't really touched a drop for over two months."

"That's quite a triumph."

"And it has made such a difference to him as a man. I often think of poor Emmy, and how happy she might have been if he had pulled himself up in her lifetime. He very rarely has these bursts of temper now. Upon my word, if you saw him in one you would compare him to nothing but a hysterical child. The last time it happened it was at one of the maids, over quite a trifle, and I spoke up sharply, and said I could not go on managing his house if he were to upset everything like that."

"Oh, you have been excellent for Tom Courtney all round! I can see that, Jane. But please, please don't end in marrying him. Claude and I should both hate it. I shall come over and abduct you whenever I think there is the remotest chance of your relenting."

"I shan't relent on that head, Helen, so you needn't make abduction arrangements. I'm glad to say all the legal part of the farm business has been settled up quite amicably, and the new lease signed. Sir Anthony offered to sell him the land, on very advantageous terms, but I'm afraid so much drink has killed any ambitions in that direction Tom might ever have cherished. Sir Anthony comes about the Court a great deal; he is always riding over on some pretext or other, and he takes the greatest possible interest in Tom. I'm sure he has helped more than anybody to keep him straight."

Helen's eyes danced a little.

"So Sir Anthony comes to the Court often, does he? Does he always see Tom?"

"Oh, not always, but he comes in and sits a little, talking so pleasantly to me. One quite forgets who he is. I think it such a blessing for Mardocks and the district that he bought the place. If you had known it in the Graysons' time you would say the same thing."

"I expect Sir Anthony is missing the Duchess."

"I think he is, but he does not think she will come back for another Yorkshire winter. It tried her a good deal. He will go out to Algiers to spend Christmas with her."

"So!"

Helen sat silent, her face very inscrutable, regarding her sister-in-law with a mixture of admiration, humour and affection.

"Jane, do you know you are refreshing, nearly as refreshing as a cool drink on a sultry day; you are so different from every other woman that has ever lived, or that ever will live. Well, Mrs. Hayes has got Audrey engaged at last."

They were quite half an hour discussing the fresh piece of news, which would soon make so much talk in the parish, and Jane returned to her homely duties at the Court Farm helped and cheered as she always felt by a talk with her brother's wife, and quite unconscious of all the undercurrents which were running swiftly towards the whirlpool.

The cloud did not lift from Helen's heart during the intervening days, and she dressed herself for the dinner party at High Ridges on the appointed evening with a very distinct sense of apprehension. She made a careful toilet, dressing herself with her usual taste. Her gown was black, simply fashioned of some soft transparency over a shimmer of satin. It had a square opening at the throat, with a little chemisette of white which did not shame the colour of her neck. A great bunch of warm red damask roses—the last on the tree on the south wall—gave the necessary hint of colour, and were arranged with the clever touch which characterised all Helen's dealings with flowers. She was always an artist there, never committing the mistake of massing or overcrowding, but able to give just the right effect to every bloom. When she came down the stairs with her white gloves in her hand and her cloak of flame-coloured velvet falling back a little from her shoulders, Secretan, waiting for her, came forward with a little gesture of pride.

"My dress is quite right, isn't it, Claude? I don't want to be overdressed, but I haven't much choice. I will take away the flowers if you think it is too pronounced."

His answer was to fold her in his arms without a moment's thought given to the flowers. There were moments when her beauty, even while it enchained him, made him a little afraid. For now that happiness had opened the petals of her heart, Helen was a peerless creature, and the new humility which is ever the accompaniment of a genuine love, had given the finishing touch to a most charming personality.

"I can't think, my darling, how you ever stooped to me," he cried passionately. "You were made for something better than this poor little moorland home."

She answered him with her hand on his lips.

"Treason, treason! This is my kingdom. Let me possess it to my heart's content. I want no other."

He had never known her more responsive to his love. As they were carried over the moorland road by the swift horses from High Ridges she nestled close to his side, and told him in words which had never been so clear and unrestrained that her heart was wholly his. And when the carriage stopped in the darkness at the door of the great house she turned to him once more.

"Kiss me again, Claude, and tell me that nothing will ever come between us."

When she had received his assurance she was ready to face the ordeal which her heart now more than ever assured her was in front of her.

She was in no way surprised when they entered the spacious drawing-room, and she saw at the far end of the room, standing by Audrey's white figure, a man she knew well—her old lover, Gerald Hunt.

Odds and Ends.

I wonder if everyone is as glad of new ideas as I am? Every week I find many things in our "Home Department" that are very helpful I have a few I will pass along. They may not be new to many, but woll hope there may be someone to whom they may be helpful.

I find that when baking apple or berry pies, a short piece of macaroni inserted in the vent of top crust will prevent the juice from running out as it will bubble up in macaroni.

If when making jelly it does not "jell" as it should, a pinch of alum helps.

One Monday I had a pair of heavy pants to wash, and not being able to make much impression on them, I happened to thiuk of a scrub

bing brush. I tried it and found it a great help in removing dirt.

When a tablecloth begins to show wear, it will last much longer if one or two inches are cut from one side and ends, as then a different part of cloth falls over edge of table.

If ono's closet room is limited a strip of strong cloth firmly tacked to inside of closet door is a very convenient way for disposing of dress skirts, as they may be pinned by band to strip.

If eggs become stained in nest a bit of cloth wet in vinegar very readily removes all discoloration.

An apple placed in bread jar helps to preserve the moisture of bread; and one placed in jar containing fruit cake or cookies imparts a most delicious flavor to contents.

I have for many years kept hanging in a closet several bags, with openings in front large enough to permit contents to be easily examined. I have one for each member of family, plainly marked with his or her initial in outline. In each I keep rolls of pieces like garment then being worn. Besides these I have one each for white goods and colored linings, etc. When a garment needs mending, I know exactly where the pieces needed are and so am saved the trouble of hunting for them.—Farmer's Wife, Maine Farmer.

Does Your Husband Need this Lesson.

A farmer's wife was tired all the time, when she got up and when she went to bed. Everything worried her; she scolded the children and her husband, and then cried because she had scolded. She couldn't remember what she read: even the minister's sermons were but a string of words. So her husband took her to the doctor, who examined her as carefully as a machinist examines a fine piece of machinery. "Come and see me at the office" he said to the husband, when he had finished his examinatiou. The husband went. The doctor showd him a card from his filing cabinet on which he had diagnosed the case, as follows: "Mrs. Blank—Age 40, looks 50; complexion sallow; eyes dull; figure stooped: children three; appetite poor (usually eats after family are through), food doesn't nourish; sleep disturbed, looks after children in the night, and gets up from 4 to 6 A. M.; intersts, none outside of home, has no diversions in home. Worries—Children are growing away from her, think her dowdy and old-fashioned; husband wonders why she doesn't look as yonug as her older unmarried sister. Disappointments—Has no way of getting away from home; would like to join neighborhood club; rats destroy chickens; pigs and chickens destroyed flower beds. Remarks—Fine women being spoiled for lack of cultivation; good start for case of melancholia. No organic trouble. Worn out."

"Well?" queried the husband.

"What'd you put up that silo for?" asked the doctor. "To get good feed in convenient form for winter eh? How about the manure spreader? To save work and get plant food to the ground in good condition, you say? I suppose you use your cultivator to put the ground in shape for feeding the plant? Looks as if you put lots of time and money getting food to your ground and cattle. Did you ever think of the food your wife gets?"

He confessed he hadn't, but the doctor had and told him so. "It's bad for the digestion to eat what's left when everyone is through," advised the doctor. "Couldn't you take a little more time at the table and eat with her?"

"I saw you taking down some machinery today; what were you oiling it for? So it wouldn't rust and get out of running order! That's right; take care of your tools; but, say, did you ever think what a fine piece of machinery the body is? It would be worth a lot to you if you'd keep your wife in as good running order as your machinery. Yes, I know you work hard, and there's lots of work to be done, but you don't expect a two-horse engine to do the work of a four-horse, even in a besy season, do you? you'd find some way out of putting a mare with a colt in the harness too early, even in harvest, wouldn't you? your wife has worked too hard and brought you a fine family, besides.

"What were you doing with that trotting colt the other day? Trying to get the best you could out of him by good feed and careful grooming and housing? Did you ever try to get the best possibilities of living out of your wife? Have you helped her cultivate the faculties God gave her making a home and being a mother?

When she married you she was a musician. Did you tell her you wanted her to keep that talent in wroking order to make life sweeter for you both? She loves beauty. Did you ever stop with her to enjoy the beauty of the sunset or the smell and sight of wild flowers? Have you made her a flower garden, and fenced out the pigs and chickens?

"You hate to see your machinery exposed to the weather or a good tool dulled. Have you sheltered your wife from unnecessary exposure; have you by your indifference to them, dulled her senses to the finest expressions of life—the subtle charm of childhood, nature, art and music.

"You want your wife to look neat. Did you ever think you don't look overly neat yourself sometimes when you sit at the table in your overalls, and perhaps keep on the boots you wore around the barnyard?

"Your wife wants to go to church and visit the neighbors. Have you provided her with a driving horse? If you haven't done all these things, you had better. Your wife is worn out; she has tried her best, but she hasn't had enough to look forward to. Women must have some purpose to lift them out of the grim farm life, or they break down. Study your wife, make more of her, and she'll get well; otherwise, I won't answer for the consequences."

In after years the formerly worn-out women told how a loving husband, garden fence, a flower garden and a driving horse saved her from a sick spell; her husband told how a three-dollar doctor bill saved him a million-dollar wife.—Ex.

Compare

Quaker Oats with the common. Note the richness, the flavor. Don't you think it worth while?

That is why Quaker Oats has become the world's breakfast. Its flavor appeals to the millions.

We get it by picking out the rich, plump grains. We get but ten pounds of Quaker Oats from a bushel.

Then we prepare them in a way which all people like best.

Yet this famous oatmeal—just the cream of the oats—costs but one-half cent per dish.

Make sure that you get it.

Why is Mortality Greater in Winter than in Summer?

Why is it that the death rate in winter is from ten to forty per cent higher than in summer in spite of the fact that cold air is a tonic and therefore should be a season of vigor? Winter is generally known as the season of sickness and the majority of people guard themselves against it by practically hermetically sealing their nouses.

NO FRESH AIR.

Double windows, furnished with slits a few inches long supply all the ventilation and the furnace is kept going night and day, the dry heat absorbing the necessary moisture of the air. Delicate women and children go on breathing the same air day after day and by the time spring comes they complain of languor and of being tired out after the long winter. Is it any wonder that it is so?

A POISONED ATMOSPHERE.

Air that has been breathed over and over again becomes really poison. It affects digestion harmfully and destroys the health-giving properties of our blood. But as the impurities cannot be seen we go on, with unconcern, breathing in what is really filth. Houses stuffy with used-up air and the smell of cooking, cars reeking with foul air, churches and stores in the same condition, is it any wonder we feel used up when spring comes.

THE INDIAN EXAMPLE.

As an example of the effect of closed houses, take the American Indians. They have given up living in wigwams and have been provided with tight frame houses. Now 60 per cent. of the children of these Indians are tubercular and half of these reaching maturity die of consumption. The closed house did it.

SAME WITH ANIMALS.

Even with animals the closed house is equally harmful. Seven years ago the authorities of the Zoo in Chicago left four of their monkeys out of doors during the winter. Up to that time they had been buying fifty a year to replace those that died. No one thought that a monkey could live out of doors in a climate such as that of Chicago, but it was tried as an experiment and to the surprise of everyone they not only lived but throve. Now the monkeys live out of doors the year round and seldom die except from old age. Formerly autopsies were held and about one every fortnight died of tuberculosis.

"Warm, dry air says Dr. Watt, makes children dull as well as ill. It causes headache, stupidity, bad temper." A child's body is affected by it in the same way as lack of moisture affects a plant, and if continued long enough makes him a weakling and robs him of his chance in life.

THE MOISTURE NEEDED.

The proper degree of moisture in a house should be from 40 to 70 degrees. In the school rooms sometimes falls as low as ten degrees. The lowest relative humidity found to exist on the earth is 28 degrees,and in this kind of air it was found impossible for plants and animals to exist, "and yet" says Dr. Watt, "they try to teach children in an atmosphere that is three times as dry as that which killed the hardest cactus that God ever planted on His footstool.

OPEN THE WINDOWS.

Charity begins at home. Let us always be sure that the air is fresh and sweet, and kept so by opening the windows wide at frequent intervals. The best way to get good air is to have the room warm and to let outdoors indoors—to open the windows top and bottom whenever the room is empty and keep it so until everything is fresh again.

False Ideas About Bathing.

In many homes there is a mistaken idea that if any member of the family is suffering from the effects of a cold, bathing is very injurious. In some homes children are not bathed for three or four weeks at a time in midwinter, because there is grave fear that the operation will result in disaster.

Often the undergarments are not removed for several weeks for the same reason, and every precaution resulting from this wrong impression is taken to keep the little folks healthy. And often grown people are under the same restrictions, so that the air of closely shut houses—and that class of people fear fresh air as much as water in winter—is far from pleasant to noses used to fresh oderless atmosphere.

CLEANLINESS VS. DISEASE.

It may take some time for the idea that cleanliness keeps away disease, instead of inviting it, to penetrate the minds of these persons, but in the end it is bound to come. The closely shut house is a survival of the old draughty houses, when no matter how many cracks were closed there was still plenty of fresh air in the rooms, and the no-bathing comes from the same period. No doubt it was a perilous proceeding to bathe a croupy child in a log house before a fireplace that scorched the face and chilled the back, but nowadays in comfortable homes the danger is that we will not have enough air and cleanliness.

The first thing a trained nurse does in taking charge of a patient is to administer a warm, refreshing bath, and get the tired body into fresh, sweet garments; so it is easy to take that lesson without paying a nurse for the information. A tired, fretful, sickly litile invalid will fall into sweet, refreshing sleep after a warm bath, and be ten times more able to throw off disease than if permitted to go unwashed for fear of harm.

BATHE AT BEDTIME.

The bathing should always be done at bedtime with plenty of hot, soapy water in a warm room, and then the person should go to bed at once. In our comfortable, well warmed homes of the present, winter bathing is almost as enjoyable as summer bathing, and certainly more necessary, for in summer perspiratisn and friction help rid the skin of its poisons, while in winter the heavy garments retard Nature's work.

By all means get away from the false notion that cleanliness is all right in summer and dangerous in winter. It is all right all the time and highly necesssary to health and comfort.—Indian Farmer.

BABY'S OWN SOAP

Best for Baby

Best for You

THE particles of pure vegetable oil which are rubbed into the open pores of the skin with the creamy fragrant lather of Baby's Own Soap renew the life of the skin—help nature along. It assures a soft, white, healthy skin and its use delights both young and old. Baby's Own is for sale almost everywhere. 1-12

ALBERT SOAPS LIMITED, MFRS., MONTREAL.

A WONDERFUL REMEDY

Orange Lily is daily curing the most obstinate cases of Female Disorders. Falling of the Womb, Leucorrhoea, Painful and Suppressed Menstruation, etc., etc., are all of them relieved from the start by its use, and a few weeks' or months' treatment accomplishes a complete cure. This remedy is a positive, scientific preparation, and is based on the discoveries of Pasteur and Lister. It is an applied treatment; that is, it is not taken internally, but is applied direct to the suffering parts, and it, therefore, acts with all the certainty of the known laws of chemical action. As it comes in direct contact with the diseased tissue, its antiseptic and nerve-food properties cannot help have a beneficent influence. I receive from 10 to 50 letters daily, speaking of the benefits and cures it is performing, and so sure am I that it will do what is claimed for it that I will send, absolutely free, a 35c box to every suffering woman who will write for it. Price, $1 per box, which is sufficient for one months' treatment. Address, MRS. FRANCES E. CURRAH, WINDSOR, ONT. 3

Child and Visitor.

How the visitor is to be received by the child of the house is one of the most telling points in the code of juvenile manners, for any rudeness or roughness at such a time is disagreeable for the caller, says Baltimore American. It is correct to teach the child that hospitality is one of the most exquisite of qualities, and that, therefore, the little lady and gentleman ahould show their most gracious manner when receiving the visitor. The children must not run in a band to the door when the bell rings, for if there is no maid, one child can open the door. The child gives the caller her first greeting. "How do you do Mrs. Blank" and she must reply, when asked as to her health, "I am very well, I thank you" or say the opposite in a manner equally polite. Mrs. Blank is then asked, with the same pleased manner, to walk into the parlor, where, if the mother must be called,a polite "Excuse me, please, and I will get mamma." must be given before the temporary hostess leaves the room. If the mother is out, Mrs. Blank may be asked if she would like a glass of water, or maybe lemonade—if the child knows how to make it—

and then the little miss sits down and does her best to entertain the visitor, who may want to wait until the mother returns.

But if the mother is at home, the little girl who opens the door must not foist her company upon the caller unless she is invited to do so. And when there, she must answer simply, wait until she is spoken to, and refrain from keeping her eyes glued too tightly on the visitor's countenance. If she stays out of the room entirely, it is her place to see that the visit is not interrupted with childish complaints of any sort. These little warnings are by no means unneeded, for the child nuisance has spoiled many a visit, and no conduct receives such scathing criticisn as that of the unpleasant child who makes itself a nuisance during a brief call.—Ex.

Eggs for Children.

Eggs prepared in the following way are excellent for children and invalids:

POACHED EGGS.

Never boil a poached egg. Have ready the boiling water and slip egg carefully into it. Draw the pan to a safe place where egg will slowly turn to a white jelly with the yolk perfectly soft. Serve at once on a square of toast. Tough poached eggs that have been boiled are just as difficult to digest as fried ones.

EGGS IN BROTH.

Have the beef broth very hot and stir into it a well beaten fresh egg. Serve at once. Do not cook too long; a minute or two in the liquid close to boiling point will do.

SOFT BOILED EGGS.

Into boiling water put the eggs and set them aside in a safe place at once. Allow them to stand four minutes and then serve at once in a hot cup. Never boil an egg for an invalid.

BAKED EGGS.

Break the eggs into a granite pan; then gently pour over them a hot white sauce, made by heating together one tablespoonful of flour and a little cold milk. Have ready some boiling milk (one-third of a pint for two eggs) and into it stir the thickening. Season and add a teaspoon of butter. Pour the hot sauce over the eggs and set them in an oven until they are of the consistency of poached eggs. Serve with thin bread and butter.

Different Methods of Washing.

It is astonishing the number of methods there are of washing clothes. If the subject comes up, you will find a woman ready to detail all her procedure, ending up almost certainly with the remark—"And you won't find whiter clothes than mine anywhere." One pins her faith to the dissolving powers of ammonia, another of paraffin; one sticks to Sunlight, another tries in turn all the new soaps; different soap-powders all have their clients; one woman thinks it the easiest plan to steep the clothes with soap and powder, and let them "wash themselves"; another pops them dry straight into the boiler, and counts that her washing day is shorter than her neighbour's, and her table-linen whiter. There is no regson why any woman should change her method for another, unless it promises a shorter process and less work—and the two go together. The hardest and most tedious way of all is to rub and scrub the dirt out—that is still practically the way of the ordinary washerwoman. The mistress who superintends her own wash strives to find out the quickest and surest way of dissolving the dirt out of her clothes.

Don't let repairs eat up your profits

Whether they represent actual cash outlay, or only the time of yourself and your help, repairs are *waste* just the same. When you make an improvement—no matter how small its cost may be—let it be *permanent*. Then it is a real investment, something on which you can realize in *cash* should you decide to sell your property; and something that will pay you constant dividends in convenience, sightliness and comfort as long as the farm remains your own.

Concrete Improvements Are Permanent

They last as long as the very hills themselves. They do not require experts to build them. Their first cost, in most cases, is no more than for inferior materials.

Aren't you interested in the subject of permanent, modern farm improvements?

Then write for the book that describes hundreds of them—

"WHAT THE FARMER CAN DO WITH CONCRETE"

It isn't a Catalogue. Every one of its 160 handsomely illustrated pages is interesting and instructive. They tell how to mix concrete, how to place it, what can be done with it. The book was printed to sell for 50 cents, but we have a copy for you, free.

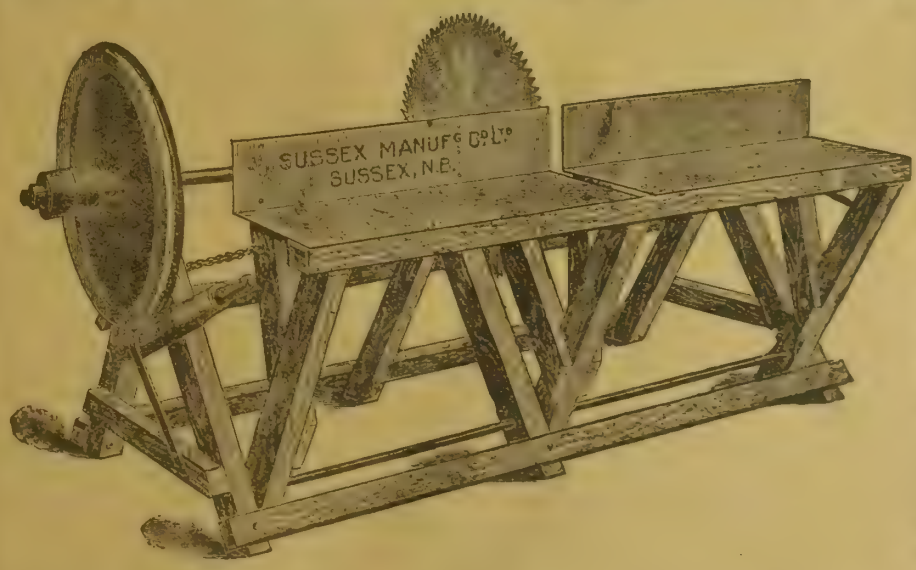
Wood Cutters Made in Three Sizes.



We make the best Wood Cutter on the market. The length of table on our Long Swing is 8 feet, 3 inches; distance between balance wheel and saw 4 feet, 3 inches. Heavy substantial frame and well braced. Steel plate table.

Length of table on Flat Rolling Machine is 8 feet, 3 inches; distance between balance wheel and saw 4 feet 3 inches. The table of this machine moves on grooved rollers and vd. track, which holds the table in position, making it move very easily to and from the saw.

Our Short Swing is built on the same principles as the Long Swing, the arbor and frame is shorter; length of frame 4 feet, 3 inches; distance between balance wheel and saw 3 feet. 6 inches.

On all our machines the arbor is the same size, made of the best turned steel and runs in bearings of the best babbitt. The balance wheel is a solid web and weighs 180 pounds.

We have a large number in stock and can ship promptly. All enquiries will have prompt attention.

The Sussex Manufacturing Company, Ltd., Sussex, N.B.

Had Palpitation of the Heart

Weakness and Choking Spells.

When the heart begins to beat irregularly, palpitate and throb, beats fast for a time, then so slow as to seem almost to stop, it causes great anxiety and alarm. When the heart does this many people are kept in a state of morbid fear of death, and become weak, worn and miserable.

To all such sufferers Milburn's Heart and Nerve Pills will give prompt and permanent relief.

Mrs. John J. Downey, New Glasgow, N.S., writes:—"Just a few lines to let you know what your Milburn's Heart and Nerve Pills have done for me. I was troubled with weakness and palpitation of the heart, would have severe choking spells, and could scarcely lie down at all. I tried many remedies, but got none to answer my case like your Pills. I can recommend them highly to all having heart or nerve troubles."

Price 50 cents per box, or 3 boxes for $1.25. For sale at all dealers or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Soup Making

For the family that is fond of soup, but whose palates are tired of the ordinary vegetable soup, these suggestions may prove of interest:

Puree of Tomato—Boil and mash in two quarts of water four large white potatoes, one small cooked onion; press through a sieve and return to the fire to cook. Add salt and pepper to suit; then pour gradually into another saucepan where three tablespoonfuls of butter have been mixed with three of flour, as for tomato cream soup; stir until creamy then add one cupful of hot cream and serve. If an onion is not at hand and there is a bundle of chives or a bunch of parsley, mince some of these herbs and sprinkle into the soup after pouring it into the tureen As some flours thicken more than others, the cream soups and purees must be diluted to form the consistency which the family likes best.

Swiss Soup—Pare and slice one turnip if large, two if small; cut into very thin slices and cook in salted water until tender enough to press through a sieve. Add the puree to a thickened milk soup, and when serving, sprinkle over the top a tablespoonful of rich American cheese.

A Windsor Lady's Appeal.

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 809, Windsor, Ont.

Personal attention given to sales of utter, Eggs, Hogs, Beef, Poultry, Fruit. Vegetables, etc., Consignments solicited. Proceeds of sale remitted promptly, Halifax prices sent on application.

TELEPHONE 906.

Tomato Soup—Place one level tablespoonful of butter in a saucepan, and when it bubbles, stir in one rounding tablespoonful of flour and mix to a smooth paste; then pour in gradually, while stirring constantly, two cupfuls of strained tomato and two cupfuls of boiling water, to which has been added a teaspoonful of beef extract, stirred until dissolved. Cook for not less than ten minutes, which will prevent any taste of raw flour; add salt and pepper to suit, and then serve. If the taste of onion is liked' a small one may be sliced and browned in the butter before adding the flour.

Tomato Cream Soup—Place a pint of milk in a double boiler, and when it is scalding hot, stir into a saucepan into which has been melted two tablespoonfuls of butter and two level tablespoofuls ot flour smoothed to a paste; cook until the milk is creamy, then return to the double boiler to cook until the mixture coats the spoon instead of running off; then add two cupfuls of strained, cooked tomato. Salt and pepper to suit.

Baked Bean Soup—Press enough baked beans through a sieve to measure one pint, then add one quart of hot milk. Fry a medium-sized onion, peeled and sliced, in a little butter until it is tender, but not browned; then add to the soup and cook for ten minutes counting from the time it is hot. Serve with small cubes of stale bread browned in hot butter.

Carrot Soup—After scraping, cook one large or two small sized carrots until tender, cutting them into slices to do the work quickly. Press the vegetable through a sieve and add this pulp to a quart of milk thickened as given above.

More Courtship After Marriage

Some men seem to consider their marriage certificate as a sort of paid-up policy of happiness. They act as if the courtship days were those of paying premiums of compliment, cheerfulness, courtesy, consideration and chivalry, and that marriage cuts all of these premiums of lover-like attention. The only way to get an absolutely guaranteed insurance on matrimony is to keep paying the premiums. Many first-class matrimonial policies lapse just because of these suspended payments.

There is a tendency to assume that this love is known and recognized, so why speak of it? This is a dangerous taking for granted of what should be made real, pulsing and vital in thought, word and deed. There is little danger of over telling this story; it is often the wine of life and inspiration to one hungering and thirsting for the little tendernesses of affection. There are more people on this great, big, rolling earth hungering for sweetness, tenderness, and words of appreciation, genial confidence and generous affection than are starving for bread. With husband and wife these delicate messengers of affection cost so little—sometimes only a thought, but it is the thought that is all.

Continued courtship after marriage preserves the lover in the husband and the sweetheart in the wife. But courtship is not solitaire; like a quarrel, it requires two to make

it a success. It is not the wife alone who needs the gracious sweetness of concentrated comradeship, for husbands who are built on the right lines have the same hunger for loving kindness and kindly loving.

Courtship is a vessel of promise that is often wrecked on the shoals of matrimony. Courtship means two mates without a captain; marriage sometimes becomes two captains without a mate.

The Bedroom

If your bedroom and sitting room is one and the same apartment, and you do not wish your bed to appear for what it is, get a regular bedstead with four solid metal legs, good springs and a good matress. To cover it in the day time, get cretonne or some other goods that will harmonize with your other furniture, make a covering exactly the size of the bed, enveloping the head and foot with fitted pieces of the material, This will make the bed look like a big settle in the daytime.

Be sure that your bedclothes are thoroughly aired and your nightgown as well and if for sone reason the bed must be made up at once after getting up in the morning, put the outer covering over it, having removed the sheets to give them a chance to air at the window. Fold them up in the daytime to be replaced at night in the regular way.

Household Suggestions.

For gloss, kid shoes that have become sunburned and parched, cold cream off the dressing table will prove a restorer.

Varnish the linoleum on kitchen, bathroom and hall floors to insure its lasting qualities. The varnish should be thoroughly dried before the floor is stepped on.

Cut newspaper sheets into four pieces, put astring through one corner and hang near the sink. If a sheet of paper is placed under any cooking utensils that are set in the sink after being taken off the stove, much scrubbing and cleaning will be saved.

To set the color in cotton dresses that are to be washed, dissolve three gils of salt in four quarts of hot water, put the material in while the water is hot and let it remain until cold. In this way the colors are rendered permanent and will not fade in the washing.

A new feature in the way of table appointments that is decidedly practical is the asbestos spread. These covers take the place of the old-fashioned silence cloth of flannel and are much more sensible, as they may be bought in sections that are folded up when put away.

Belcher's Farmers' Almanac.

We have received a copy of the 1912 Belcher's Farmers' Almanac for the Maritime Provinces. As usual its make-up presents a high standard of excellence and contains a fund of information on a great many subjects. As a ready reference book it should have a place in the library of every progressive farmer in Maritime Canada. A copy may be procured by sending your name and address accompanied by 25 cents to the McAlpine Publishing Co., Ltd., Halifax, N. S. The Almanac is well worth the money.

WIN A PRIZE

GIVEN AWAY

And many other Prizes according to the simple Conditions of the Contest (which will be sent).

Each one of the above four lines of figures spells a word. This most interesting puzzle can be solved with a little study, as follows: There are twenty-six letters in the alphabet, and we have used figures in spelling the four words instead of letters. Letter A is number 1, B number 2, C number 3, etc., throughout the alphabet.

USE YOUR BRAINS. Try and make out the four words. **ACT QUICKLY.** This is a chance for clever persons to win **Cash** and other **Prizes** with a little effort. Write the four words, with your name and address, neatly on a piece of paper or post card and mail to us, and we will write you at once, telling you all about it. You may win a valuable prize. **Act Promptly.**

DOMINION PREMIUM CO. 210 St. James St. (Dept. 91a MONTREAL

FLORICULTURE.

H. B. A., St. John, writes:—In making some changes to my house this fall, three large Honeysuckle plants had to be removed and, as the ground was partly frozen, very little roots were left on the stalks. Should the stalks be pruned, and to what extent? Would you kindly give me the botanical name of the Calla Lily?

By all means prune the top of the vines severely, if roots have been partly destroyed. If one half the roots have been removed prune off three-quarters of the top. The botanical name of the Common Calla Lily is Arnm aethiopicum.

Carlton, N. S., Correspondent, writes:—What is the best sort of shrub for a small lawn, one that will not grow too large and that will not require much attention? How is a plant called the Sultana grown? I mean whether from seeds or slip and will they stand frost?

Probably the best all round hardy blooming shrub is the Hyderangea paniculata but of course the nature of the soil and situation, as regards sunlight, etc., should be considered, in planting shrubbing of all kinds and of which you omitted to give any information. But, probably the Hyderangea would give the most satisfaction under the most varied conditions. By "Sultana" I presume is meant that free blooming plant the Impaticus Sultani. It is grown from both seeds and cuttings and while presenting much the appearance of the Balsam, as regards its wood, it is as easily grown as a Geranium but unlike the Geranium it likes plenty of water.

Mrs. S. H. A., St. John, writes:—I have several rose bushes in my garden that were neglected last fall and were not given any protection so that the tops now seem all brown and dead. Do you think they will grow again from the roots and should the tops be cut off? If so, when should they be given fertilizer? I omitted to state that they were English budded roses and bloomed profusely last season.

If the stalks are killed back to the bud the sprouts that will come up next spring will be worthless, being almost sure to be from the wild rose stalk. If, however, they break above the bud they will be all right and all shoots below the bud should be nipped off. Do not prune until you find out how much is dead, which will not be for some weeks yet. A little well-rotted manure is the best fertilizer and should be spaded in around the plant.

H. P., of St. John, writes:—Kindly give me some idea of the best way to prepare a flower bed. I want to know in time so I can order my shrubs, roses and plants. The soil is rich, being at one time an old garden in which vegetables grew luxuriously. It is now a mass of grass and weeds and there is considerable Burdock growing in it. How shall I get rid of the latter? It is a sunny spot and sheltered from the winds. Would I require any fertilizer and if so what sort? Would super-phosphate do?

Dig up the sod and weeds thoroughly shaking out all soil and cart them away. You will have to dig down deep for the Burdock roots but try and get as much out as possible. Form the soil into beds the size you desire, raising them about three or four inches. From what you say about the growth of vegetables the beds might do witnout manure. Don't use super-phosphate. If you can get some well rotted manure you should use some of that but if not better wait until next seasan. You will probably have a crop of seedling Burdocks all summer intermittingly but by pulling them up as soon as they appear you will conquer them all right.

A Correspondent, writes:—I had a fine bed of Hyacinths that came up nicely, buds well formed and healthy but to my surprise I found them all wilted and, in some cases, rotted off. When I looked at them the first of the week the foliage was all right and the buds that were opening but the new ones, about two inches high, are all destroyed. There is no sign of a worm or insect. What was the cause?

Please tell me what to plant in a shady place as I am anxious to get my young seedlings started as early as I can?

The heavy frost of that Sunday probably was too much for the tender bulbs. I do not remember such a heavy frost so late in the spring. With us it killed our Dielytra spectabilis which I never saw done before. Several cases of Hyacinths being frozen as you describe came to my notice that spring.

Plant Pansies, Fuchsias, Tuberous Rooted Begonias, Lobelia Daisies, Forget-me-not, seeds and slips, the first of March for very early ones, in the home. The Tuberous Rooted Begonias are the finest flowering plants I know of for a shady spot. They bloom freely from frost to frost, with beautiful foliage and the tuber is better another year.

Manure Memo.

Quite often we are asked by farmers, agriculturists and theorists, if we are not manure cranks, "humus cranks," some express it. We do not shy at the word "crank" for we have discovered that it is used as a word synonymous with "enthusiast" "believer-in" and is in no way, manner or form in the caregory of fighting language. Our answer to the question is always the same, boiled down it is—"we are humus cranks," because practical experience of several thousand years has proven it to be the one absolutely reliable, always the same, never-failing friend to growing plants of every description. Back comes another question nine times out of ten,—"Do you know of any others who have found manure a good thing?" Of course the answer to this question when time is plenty, if put in print would look like the directory of a big city for it would contain the name of every successful grower. Being rather limited as to space we will have to sort out a bit and simply use a few items, instances and individuals.

Down in Maryland, we have a friend who pays $2.90 a ton for manure on the railroad tracks. He spends thousands of dollars annually for manure and gladly hauls and spreads it. He is the most successful grower in his district.

In Massachusetts we have a friend who pays from $3.50 to $5.00 per t n. on the railroad tracks. He knows no tough years, the worst drought has not caused him to lose a crop and his bank account is proof positive that the use of manure is a glorious financial success.

We have a friend on Long Island who does not find time to handle his manure during the Summer when he can get it from 90c. to $1.00 per ton. He waits till Fall, when the crops are all in and finds it pays him well to buy it for $1.85 per ton.

Prof. Watts, of the Pennsylvania State College is a double-barrelled agriculturist. He has made good at the practical end of it, and he is everlastingly making good at the theoretical end. He is the ideal agriculturist; he is not addicted to hobbyisms and consequently does not let good things get away simply because they don't jibe with some pet mathematical combination. He is not working to prove that x equals y. Here's a quotation or two from him:

"Manure is the best of fertilizers for vegetable growing, because if used in large quantities the supply of

The Best Built Roller

Is the "Bissell," with DRUMS of heavy steel plate, hard in temper, riveted up close, having pressed steel heads.

With AXLES of 2 inch solid steel revolving on cold rolled Roller Bearings.

With the MALLEABLE CAGE in one piece, holding the Roller Bearings in line on the axle.

With DRAW BRACKET under the Pole, making the draught down low.

With the FRAME all of steel and the improved steel plate bottom.

You may be told that other Rollers are like the Bissell—but there is only one original Bissell Roller and to save our customers disappointment, we put our name on every Roller we build. Look for the name "Bissell" and ask Dept M for catalogue describing the "Best Built Roller."

Several styles and a variety of widths to choose from, 6 ft. up to 12 ft. Grass Seeder Attachment also furnished if required. 65

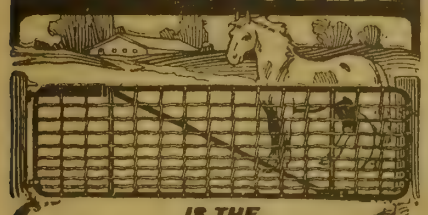
THE GATE THAT SERVES YOU BEST



IS THE

Peerless Extra Long Extra Strong Gate

Gates should no longer be looked upon as mere holes in the fence where a bar or any makeshift of an obstruction sufficient to keep the stock will do. **A good gate is as essential as a good fence.**

Insecure gates are a menance to the lives of stock and crops and should be promptly replaced with **Peerless Wire Mesh Gates.**

These gates are built of the best materials. Have a frame-work of extra heavy pipe filled with the very best grade of wire mesh. The frames are electrically welded and are air tight so no water can get in and rust out. They are braced with one diagonal and a short horizontal brace and two vertical ones, thus making a very strong rigid gate which will not sag.

The frame and mesh is heavily galvanized and will not chip, flake or rust.

Peerless Gates are strong, durable and satisfactory, will look best, wear best, and serve you best. We especially recommend their use with **Peerless Wire Fencing.**

Write for our Catalogue

We also manufacture a large and reliable line of farm and poultry fencing, walk and ornamental gates and fencing.

Agents almost everywhere.

Winnipeg, Man. Hamilton, Ont.

humus is maintained and it is then possible to follow an intensive system of annual cropping. Manure keeps the soil loose and friable retains moisture, furnishes plant food, provides favorable conditions for nitrifying bacteria. An application of 50 tons per acre is a large one, but even larger amounts are sometimes used. It is a fact that those who use manure most freely are apparently the most prosperous."—L. I. Agronomist.

Making a Hotbed.

For those who wish to start their vegetables early, the hotbed, which is merely a nursery for the tender plants until they are ready to take care of themselves in the outdoor climate, is of practical value. There is little work and expense to making a hotbed that any person may operate successfully with a little experience.

Manure is usually the heat supplier in the ordinary hotbed, though if hot water or steam pipes can be connected for more extensive work without too much extra cost it is an excellent source of the bottom heat for the hotbed. Early radishes and lettuce may be grown entirely under glass, getting a crop an the table before the ordinary garden crop is in the ground.

The manure that goes into the hotbed should be of uniform age, horse manure from a livery stable being the best source as a large supply of manure that is of practically the same age can be obtained. This manure should be about half straw or litter. Too much straw allows the heat to escape too fast, while manure having too little straw packs down soggy and "burns out" without getting the heat up to the plants.

To get the manure started to ferment, pile it in a long pile 4 to 6 feet deep, and under cover if possible. If the weather is too cold the manure will be slow in starting to ferment and may have to be started with a little warm water. When it gets to fermenting it is highly essential that it ferment evenly and it will be necessary to mix it from four to six times during this process, being careful to break up all chunks. When it is steaming uniformly it can be placed in the pit of the hotbed and covered with the layer of earthin which the plants are to be grown.

A layer of one to two inches of some coarse material should be spread evenly over the bottom of the pit before the manure is put in, followed by 12 to 30 inches of manure, a layer of leaf mould or other coarse material to serve as a distributer of the heat, and finally four to five inches of soft garden loam on top.

The manure should be put in in layers of four to eight inches and thoroughly tamped down before the next layer above is put on. This gives a uniform heat. For early starting in cold climates deeper beds are better. The bed will heat up vigorously for a few days at first. A thermometer should be kept under the frame. When this registers about 90 degrees F. tomatoes should be sown. As the heat subsides a bit to 80 to 70 degrees, sow cabbage, lettuce and other cool plants. The frame should be kept tightly closed the first week, no matter what the weather outdoors. When the plants come up, however, it will be necessary to watch them closely. Water in the morning and raise the rear of the sash a bit in the middle of the warm, sunny days to keep the plants from getting too hot. The sun's rays come through glass, carrying all their heat no matter how cold it is, remember, and it will get much warmer in midday, under the frame, than [illegible] night, and during cold nights and severe weather it may be necessary to spread carpets or matting over the frames.

Principles of Ice Storage.

In order to keep so perishable a commodity as ice it is necessary in the construction of a storage structure to consider carefully those physical and mechanical principles which underlie its preservation. (1) To keep well, ice must have a minimum of surface exposed to the air or to the packing material. This is most easily accomplished by piling the ice in the form of a cube. A mass of ice 12 by 12 by 12 feet exposes less surface than the same tonnage piled in any form less nearly that of a globe. (2) The keeping of good ice depends upon the completeness of its insulation; whereby it is protected from external influences, such as heat and air. (3) Drainage is important because the lack of it interferes with the insulation. (4) The ice itself must be packed so as to prevent as completely as possible the circulation of air through the mass. The more nearly the mass of ice approaches that of a solid cube, both in shape and texture, the easier, with good drainage and insulation will be the keeping of ice, then, depends upon the shape of the mass, its insulation its drainage, and its solidity.

The Na-Dru-Co. Almanac for 1912.

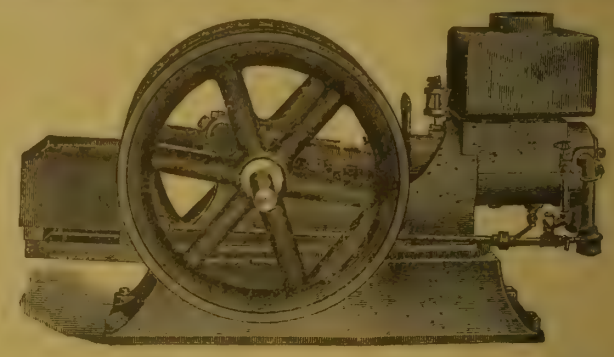
A good almanac is ever welcome. The annual number of the Na-Dru-Co Almanac, the 1912 edition, now out, is if anything more interesting and more useful than its two predecessors.

Besides the usual solar and lunar tables and dates of eclipses, the Na-Dru-Co Almanac gives much information which it would be difficult to find elsewhere. Examples of this are the Map of Altitudes, Time Tables of the World, Figures on Area, Population, Exports and Imports, Records of Canadian Premiers, Governors-General, etc.

Nearly all leading Druggists have copies of the Na-Dru-Co Almanac for their customers, or it may be had by writing the National Drug & Chemical Co., of Canada, Limited Montreal.

Your dear old tea-cup is to carry a keener delight, a new tea joy to your lips! For into tea flavor—the very essence of tea joy—an even richer fullness, a more zestful vigor has been blended. The result is King Cole Tea With your very first sip you marvel that such flavor-improvement could be possible! It tastes so unusually good. And it never varies, year in, year out.

YOU'LL LIKE THE FLAVOR.



The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

THE WATERLOO GASOLINE ENGINE CO.

J. D. FRIER, Sussex, N. B., Eastern Representative.

Vegetable Matter in Sandy Soils.

The addition of vegetable matter to sandy soils is very important since it is needed to increase their water holding capacity as well as to add fertility. Water is often the limiting factor in the production of sandy soils, due to their coarse texture and lack of vegetable matter. The average sandy soil contains only one-third to one-half as much fertility as clay loams. Legumes are beneficial to sandy soils, because they supply the much-needed nitrogen as well as humus. Rotations for sandy soils must be chosen, so as to increase the amount of vegetable matter and provide a legume crop to cover the soil at least once in every three years.

The Turkey and What He Can Do For the Woman on the Farm.

(Continued from page 346).

exhibition until I have run him off the place in sheer disgust, when his worthy dams took after him as though anxious to share his disgrace as well as his bad temper.

No it cannot truthfully be said there is anything angelic about a turkey. I have always maintained he shares the character and lovable disposition of the American Indian with whom the Pilgrim Fathers found him affiliated. But as a money making proposition for the farmer's wife that is where he scores. If a woman longs for Haviland China, Cut Glass or perhaps she aspires to a real Oriental Rug, Saruk, Antique, Sehma, Khorassan Joshghan, or the Yambud-Bokharas; it may be she would send the clever son or daughter away to school but lacks the means—well the solution of the problem is within her reach—a word to the wise is sufficient. It is a fact in presenting the turkey as a money maker you may often, among the audience, see an incredulous head shake, but the turkey as a money maker has everything his own way: we all give him our unanimous vote, with the proviso of the faint hearted "If you have good luck and can raise them." One thing in favor of the turkey is the fact that no elaborate outfit is necessary after securing the breeding stock, and one had better get good birds as one can afford of a hardy strain to insure success and good returns from the investment. No farther expense is necessary.

I raised all my turkeys last season in dry goods boxes about 4 x 5 and two feet high, with a roof of tarred paper, that one can buy for a few cents a pound. I cut out a board in one side and substituted wire netting about three inches wide, running the whole width of the box and tacked on securely. This with scrupulous cleanliness made a splendid roosting place for the domestic hen mother and her brood. I confined them rainy days, and they seemed to be very comfortable in these boxes. I did not lose a turkey by drowning last season. Speaking of domestic hen mothers, I have never used a turkey hen to hatch my young birds and never expect to. I sometimes think the turkey father is justified in his treatment of the turkey mother. She is certainly an aggravating bird. Then, another and a very good reason, if a turkey hen is not permitted to set she will lay twice as many eggs, yes two-thirds more. Our motherly old Rhode Island Red hens leave nothing to be desired, as I consider they are reliable and steady as incubators. Now, this brings us to the lice question. The louse indigenous to the turkey, appears to be no serious problem; but let your turkeys come in contact with the domestic hen louse, and you may look out for breakers ahead, as they seem to raise the particular mischief with them. I use the ordinary Dalmatian fly powder on my setting hens without stint, and as often as once a week at least. It is best to be sure that the hen mother is absolutely free from lice at hatching time, and then use the powder hereafter merely as a precautionary measure, and never at night, or any time you think the mother is apt to hover her birds, immediately after dusting, else the powder may get into their eyes from her feathers, and you will have some little blind poults, and excessively unhappy birds.

As the turkey is so much given to passing away swiftly and mysteriously, the desire to preserve their profitable lives until the holidays tempt one to fuss over them altogether more than is good for their health and the future of their children's children as breeding stock. There is not one of the feathered tribe for which domestication has done so little or robbed of so much as the turkey, and in the end the confinement in close stuffy houses in winter or any time in fact, will prove fatal to him. Very few have the courage to treat a turkey as he should be treated; for my part it never rains hard but I find myself nervous and over anxious thinking about them and wishing fervently I could get them all indoors and shut up until the sun gets out again. As they stalk around miserably with every now and then an impatient flirt of their wet feathers, it's not likely they are half so unhappy as they look, or nearly so much concerned as the ones who have so little wit as to put in many bad half hours worrying about them.

Right here I must take up a little eulogy to the memory of a man who bred turkeys, and to my mind raised them as they should be, in a way to add to their value and vigor, rather than detract from it, and rob them of the little vitality that remains to them after the vicissitude of domestication. My first pair came from this flock, a fact for which I am profoundly thankful. The location of his home was greatly to his advantage. It happened to be a large island, with an acreage of about two hundred acres. For something over a hundred years sheep have been raised there, and this man and his people, for several generations, had been engaged in this industry. To my certain knowledge no new blood had been introduced for a long term of years and the flock had never known what it was to be sheltered in a building of any kind. They were never fed in winter, but lived entirely on the sea weed, and the beach at low tide was their feeding ground. By intelligent selection, and the breeding together of the best specimens in his flock, and by mercylessly weeding out undesirable lambs, by a kind of survival of the fittest his flock came to be unsurpassed for size and hardiness. This same principle he applied in later years to his flock of turkeys. My brother, who often visited this island; that always proved a kind of mecca for gunners, since Black Duck and Eider Ducks were nearly always to be had, told me how the turkeys selected their own particular tree, and no difference how the storm whistled or the snow blew about their ears, they merely hopped a few branches nearer the top, and hung on for dear life. I admit this makes me shudder. My heart warms every time to the man who regardeth the life of his beast. But when it comes to practical results I believe this flock of turkeys were among the hardiest ever known. With him a sick turkey was about the same as a set of "sure enough" hen's teeth. The barrels of dressed turkeys he shipped from that island would stagger some breeders who have had flocks afflicted with blackhead and the results of improper feeding, and care of the breeding stock. When this man died, the results of his life long endeavor to improve his sheep and turkeys was scattered abroad; about all the turkeys came to grief on the block. A remnant of the sheep survive, and so it is one generation builds another tears down. Of course about the only means by which one judges the success of an enterprise is the result and even if his methods were open to rather severe criticism, this breeder produced "the goods" every season. One season I remember the price of turkeys soared, because of the cold backward season; there did not seem to be half as many as usual on the market, the price went to thirty cents and even better in some places. A friend in the west was offering a young mule for sale and could not seem to place him. An acquaintance called her up on the 'phone and suggested that she exchange the mule for a turkey. But even in an off season Mr. Cheney turned off a profitable flock. I believe it was because he had pretty nearly reverted to natural conditions, and the health of the flock had improved in proportion. Altogether for a flock of, say ten breeding birds he would scatter perhaps one quart of oats a day, and they eked out a living someway in their wanderings round their island home. But one thing certain he never lost a bird from overfeeding, as a man of our acquaintance, lost half his breeding hens last winter. On opening one, he found the liver of white spots, and he knew he himself was to blame for their death, although he was sure they were getting only enough to sustain life. Truly a turkey is a queer bird.

I believe much of the cooking "Johnny cake" and preparing special mixtures to feed the poults is a great mistake. Up to within a few weeks ago I thought I had blazed a trail among the labyrinth ways of turkey feeding, but on looking over the old files of some poultry journals I found an exceedingly interesting statement from a woman who declares she followed exactly the same method with completo success. This is nothing more or less than plain

Learn why PURITY FLOUR is unlike any other brand

PURITY FLOUR is unlike any other brand of flour. No two milling companies follow exactly the same process of milling. In fact, no two different brands of flour in the world are exactly alike in quality.

And here is another fact worth knowing: Every wheat berry contains both high-grade and low-grade portions.

The process of milling PURITY flour costs more than to mill ordinary flour. The low-grade portions are separated and excluded. PURITY is an ALL HIGH-GRADE, hard wheat flour. It has greater strength, greater absorption and greater expansion. It is a thirstier, more elastic flour. It drinks more water and expands into more loaves.

Use PURITY FLOUR for your next batch of bread. Count the loaves. You'll find you have made "MORE BREAD AND BETTER BREAD" from PURITY than when you've used an equal weight of weaker and cheaper flour.

WESTERN CANADA FLOUR MILLS COMPANY Purity MANITOBA HARD WHEAT

PURITY FLOUR

"More bread and better bread"

IMAGINE, if you can, how much whiter, and more toothsome, and more nutritious, the bread made from such a HIGH-GRADE flour must be.

And can you imagine yourself enjoying the flaky pie-crust and the light, delicate cake? —your reward for using PURITY flour

When making pastry, please remember to add more shortening than required with ordinary flour—for on account of its extra strength, PURITY FLOUR requires more shortening for best pastry-results

Yes, PURITY FLOUR costs slightly more than ordinary flour. But use it once and you'll say it's worth more—much more—than the difference.

Add PURITY FLOUR to your grocery list right now.

WESTERN CANADA FLOUR MILLS COMPANY Purity MANITOBA HARD WHEAT

simple rolled oats mixed for the first week or two with hard boiled eggs. One can reduce the eggs gradually until they are getting but one a day, better give it in one feed in the middle of the day. This would be about right for a flock of ten youngsters. I feed three times a day. Don't feed until they gorge themselves, and lie around listless. After a little experience one can soon tell about the right amount. I keep this up until about the sixth week, when all their troubles are practically over, for after the head turns red, the turkey is one of the hardiest birds known, that is if he is given a chance and is not killed by overfeeding.

One thing I have found of greatest importance and applies to turkeys of all ages and conditions, never change the food suddenly. If your turkeys are doing well don't make a change on any account. If this must be done go about it gradually. I begin getting mine from oatmeal to middlings mixed with milk after the sixth week—mixed crumbly, not sloppy. They thrive and do extra well on this. Then, after a bit, as small potatoes can be had for a song in the digging season and for some time after to boil these and mix while hot with middlings, this makes a good feed. It is economical as well as making quite a saving in the feed bill. It is always best to economize a bit if one can in feeding, if it can be done without risking the birds, but this potato-middling mash is a winner if fine birds are any proof of it. I would not be ashamed to compare my flock with any I have seen. They are good sized, well developed with a springly, thoroughly healthy appearance. When I feed them I usually pick up some of the young toms and stroke them, a process that fills them with indignation unspeakable; they seem to take it as a direct thrust at their pride and arrogance.

The question of inbreeding is a salient one. Very few have the courage to breed as did the man of whom I have spoken. There are some who go so far as to introduce new blood into their flock every year. Perhaps a good rule would be to introduce new blood if one's turkeys seem to require it, that is if they are undersized, and seem to lack vigor, and if one does not raise a satisfactory number of young birds. I believe the possibility of only one good turkey hen is seldom realized. I have raised twenty-one birds from a single hen. I had twenty-five hatched, but lost four from trivial accidents, for instance when they were tiny: one wandered into the coop of another, hen mothering a flock of ducks, and the old wretch dealt the little fellow a death blow before I could rescue him. It is hardly worth while to go into a discussion of breeds. The White Holland is a fine bird, the Narragansett as well, but the Mammoth Bronce is "the bird." He is the largest as the standard weight for an adult bird is thirty six pounds. He is a splendid bird and seems to have been especially designed for a money maker on the farm. One can do no better than keep the Mammoth Bronze as he is in every way a thoroughly practical bird, and a very handsome one. With the wonderful metallic sheen of his plumage in the bright sunlight with all his sails set in his comical absurd strut, he's certainly impressive to say the least.

And now by all means let the woman on the farm secure a pair of fine breeding birds and be ready next season to raise turkeys. The weeks and months will slip by and she will find herself possessed of a snug sum of money, all her own, the result of her own industry, and its purchasing power will put her in possession of many little comforts and luxuries, dear to woman and not always within her means. Verily the turkey is a good friend of the woman on the farm.—Sarah E. Moses Smith, Woodward's Cove, Grand Manan, N. B.

The Live Stock Associations.

(Continued from page 343).

sures be taken to insure Dr. Rutherford's further work for the live stock interests of Canada.

That the secretary be authorized to procure record of performance diplomas for bulls as well as for females.

That bulls be admitted for registration after four of their progeny have qualified in the record of performance, each from a different dam.

That where a female has qualified in the record of performance test, that her certificate be returned to record office for enrollment of her record thereon, and in case of a bull qualifying, the number of qualified progeny be also inserted.

That a strong memorial be prepared by the secretary of the society to be sent to the Minister of Agriculture for the various provinces in regard to the payment for milk by the percentage of butter-fat, that legislation be made making this compulsory.

That a grant of $200 be made to the Ayrshire classes at each of the three Winter Fairs at Guelph, Ottawa and Amherst. That if the amount of 50 cents per member paid to the Dominion Cattle Breeders' Association for the Ontario members does not equal $200, that this amount be made up out of the funds of the association and be given to the Ayrshire classes at Guelph Winter Fair.

That the fee for registration to members for bulls under two years of age be $2, and for over two $4 for non-members. That transfer fees to members be fifty cents, and a fee of $5 be charged for every cow or bull that registers in the record of performance test.

The officers for 1912-13 are:—

President, Hector Gordon, Howick, Que.; Vice-President, W. Stewart, Menie; Secretary, W. F. Stephen, Huntingdon, Que.; Directors: Messrs. A. Hume, Menie; J. McKee, Menie; W. Ballantyne, Stratford; A. Kains, Byron; W. Stewart, Menie; A. H. Tremble, Alberta. For the East: R. R. Ness, Howick, Que.; Hon. W. Owens, Montreal; N. Lachapelle, St. Paul l'Ermite, Que.; J. Bryson, Brysonville, Que.; Hector Gordon, Howick, Que.; P. D. McArthur, N. Georgetown, Que.; G. C. P. McIntyre, Sussex, N. B.

THE JERSEY BREEDERS.

Everything is in ship shape in the Jersey Cow circles. 715 registrations were made during the past year and 336 transfers were granted. The membership list numbers 174.

A resolution was passed asking that the services of Dr. Rutherford be still requested for the interests of the live stock future of the Dominion.

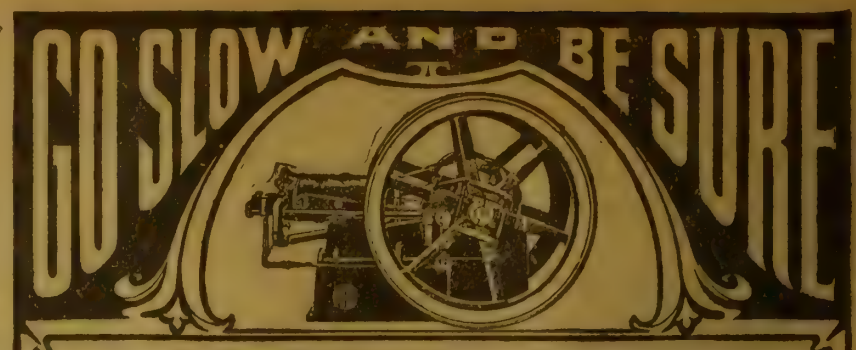
It was suggested that the record of performance test be of a dual character, taking into account the cost of feed and value of manure.

Following are the officers for 1912-13:—

President, D. Duncan, Don, Ont.; Vice-Presidents, D. O. Bull, Toronto, Ont.; T. Porter, Toronto, Ont.; H. W. Edwards, Coaticook, Que.; W. V. Edwards, Souris, Manitoba; H. S. Pipes, Amherst, N. S.; Sec. and Treasurer, R. Reid, Berlin, Ont.; Directors: F. L. Green, Greenwood, Ont.; R. J. Fleming, Toronto, Ont.; S. J. Lyons, Norval, Ont.; B. A. Bull, Brampton, Ont.

THE GUERNSEY BREEDERS.

The Annual Meeting of the Canadian Guernsey Breeders was held in Amherst, N. S. during the Winter Fair; a report of the proceedings appeared in last issue of the Maritime Farmer.



It's wise to decide that you need an engine. But don't spoil your good intentions by buying a cheap one. Don't be blinded by a low price or by wild claims. Go slow and be sure. Buy an engine that has proved its worth, from a concern that has proved its integrity. You can't afford to make a mistake—it's much costlier than the price of an engine.

I H C Gasoline Engines

are in use on thousands of farms throughout the country, running the many farm machines, such as the cream separator, churn, feed grinder, pump, fanning mill, thresher, washing machine, electric light plant, etc. They guarantee you reliable power for every requirement at a surprisingly small cost.

I H C gasoline engines are marvels of simplicity, strength, economy, reliability, and durability. They run steadily and smoothly, year in and year out. They make and save money every time they are used, and if, by accident, you should need repairs, you can get them promptly with little trouble or delay from the I H C dealer in your locality.

Don't you think it would pay you to investigate an I H C engine before you buy any? They are made in so many sizes and styles that you can select just the right size and style for your work: Vertical type—2, 3, 25, and 35-H. P.; horizontal—1 to 50-H. P.; semi-portable—1 to 8-H. P.; portable—1 to 25-H. P.; traction—12 to 45-H. P.; sawing, pumping, spraying, grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. Ask the I H C local dealer for catalogue and all information, or, if you prefer, write nearest branch house.

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizers, etc., write to the I H C Service Bureau and learn what our experts and others have found out concerning these subjects.

THE SHORTHORN BREEDERS.

Steady progress and increased interest on the part of the general public marks the past year's work of the Dominion Shorthorn Breeders' Association. A pleasing feature of President Peter White's address was the intimation that the champions at the prominent Canadian fairs are Canadian bred or from sires and dams of Canadian birth.

There has been a great demand during the past year for "farmers' bulls" indicating that Shorthorns still maintain the premier place in the beef classes.

President White also paid a high tribute to the milking Shorthorn and said she was the type of cow the farmer must produce. There was bound to be an increase in the price of good beef and breeders would do well to put their house in orher and be prepared to reap their share of the high prices.

The 1911 receipts amounted to $14,-121.36 of which there is a substantial balance on hand. A grant of $100 goes to the Ha,ifax Exhibition and $50 to the Maritime Winter Fair.

Probably the most important part of the business transacted was the passing of the following resolutions:

That all grants to exhibitions made now and hereafter be upon the following conditions:

That each society or association obtaining a grant shall offer as much prize money (not being in equivalent to a grant from any breed association) for Shorthorn cattle as for any other breed of cattle, and in addition, duplicate the grant made by this association.

This resolution shall not apply to winter fairs. Resolved that the money shall not be paid over until the executive committee are satisfied that each animal (except grades at winter fairs) winning prize money has been recorded in the Dominion Shorthorn Herd Book on or previous to the day of exhibition, and that each is the bona fide property of the exhibitor at the time the prize is won.

That in the event that the whole prize money actually awarded and paid out by the exhibition association for Shorthorns is not equal to or greater than twice the amount granted by this association, the grant of the Shorthorn Breeders' Association shall be made proportionate.

Robert Miller cited this resolution as a basis for making out prize lists. John Bright insisted that transfers be kept up to date. Transfers are the only proof of ownership.

Resolved, also that the Hon. the Minister of Agriculture for the Dominion be requested to introduce at the present session. of Parliament a bill embodying the draft of a new live stock pedigree act, prepared by a representative committee appointed to represent the Canadian breeders, and that each member urge on his representative in the House of Commons the necessity for the passing of such an act.

The following officers were elected: President, Peter White, K. C., Pembroke, Ont.; Delegates to Halifax Exhibition, Messrs. F. L. Fuller, Truro, N. S. and R. S. Starr, Port Williams, N. S.; To St. John Exhibition, Harold Etter, Westmorland Point, N. B. and A. E. Trites, Salisbury, N. B.; To Charlottetown Exhibition, C. C. Gardiner and John Richards; To Maritime Winter Fair, E. E. Crowe and A. E. Trites.

"Real Problem is High Selling Cost, Not That of Living."

"Last year's agricultural products were worth $9,000,000,000 to the farmers. The government used farm values in getting figures for this total. Assuming that the farmers kept one third of the products for their own use, the consumers paid more than $13,000,000,000 for what the producers received $6,000,000,000. The cost of getting the year's products from producers to consumers amounted to the enormous sum of $7,000,000,000. The real problem to deal with is not high cost of living. It is high cost of selling. In the last twenty-five years our agricultural exports have increased 60 per cent. while our commercial exports have increased nearly 400 per cent. This is certainly a bad showing for the farmers.

"The business end of husbandry has been sadly neglected, and that is the chief reason why agricultural growth makes such a poor showing in comparison with other national developments. The farmers of this country, to receive better prices, do not have to experiment with untried theories. They only have to copy what others are doing successfully. For instance, the people of Denmark thirty years ago received $12,000,000 for their butter, eggs and bacon. Then they began organization of market societies. Now the same character of products brings in more than $100,000,000 a year. Nearly all their dairy products are marketed through co-operate creameries, and their egg export societies have 25,000 members. There is no talk of high living in that little country, because they have a system of economical marketing. The farmers there have organized under trust methods.

"Advanced methods in handling the business of the farm are bound to come. What we must realize is the cost of delay. We nave already waited too long. We should now work for prompt improvement in marketing facilities. All well managed creameries properly located are profitable. In most cases the creamery is the first step in co-operation or neighborhood marketing. Co-operation in marketing fruits, vegetables, grain, cotton and other products is just as sure of success when practised under correct business rules.

"It will be urged by some city people that the development of thousands of these farm market places to the limit of their usefulness will result in damage to existing business. This alarm is not warranted. Commerce is always aided and not retarded by labor-saving machinery and reductions in cost of distribution.

"The government should assist in finding a way for better farm marketing. There should be a market bureau of the Agricultural Department devoted to accumulating and distributing information on best methods and best markets for selling. This market department should be broad enough to reach all the farmers of the country. It should give the country the benefit of a thorough investigation of improved selling and marketing systems, including all means of distribution and handling. Results will be immediate.

"Strong business combinations have grown up in our country, in some cases probably too strong for healthful conditions, but they are the result of the work of business men who have taken advantage of their opportunities for organizing their forces and working for a common purpose toward good prices, cutting out useless expenses in distributing their goods to the consumer.

"These strong so-called trust organizations have taught us a lesson of distributian. They have shown us that one executive head can direct the distribution of a commodity where under old methods it required hundreds of men. Twenty years have changed our entire system of distribution through organized business combinations, except farm products, which are not handled under organization until they are sold by the producers.

"Within a few years we will have big results from organized farm marketing and our farm products will be sold and distributed under the same general combination of interests as other large business of the country are now handled. Conservation of the agricultural waste between the grower and the kitchen is of greater importance than any other, and is the one most neglected. All farmers are interested in the $2,000,000,000 of annual waste which cannot be turned into farm dividends."—B. F. Toakum, Chairman, St. Louis and San Francisco Railway.

Actions Speak Louder Than Words

Everywhere all the world over you will find the successful men and women are those who have "done things" and are doing things—you feel you can bank on them every time.

That's one reason why I always use The Metallic Roofing Co's. materials on my various contracts and work—they don't have to tell you what they will or might do but **show you what they "have done" and "are doing".**

One great advantage of the Metallic Roofing Co's. goods over any others, is that when your job is finished, whether Roofing, Sidings, Walls, Ceilings or any old thing—you know it will never need any more attention—in your life time anyway. Now take

Honest Tales by the Philosopher of Metallic Town

EASTLAKE STEEL SHINGLES

Fire, Lightning, Rust and Stormproof Have already stood the test for 26 years.

They outwear any metal shingle on the market. They are of better steel than any other. The design and construction of the "EASTLAKE" Steel Shingle is a guarantee in itself---because unless the steel is of the highest quality it will not make an "EASTLAKE" Shingle, as inferior Steel will not stand the stamping and forming.

There are no other metal shingles on the market that can stand the "EASTLAKE" process.

"EASTLAKE" Steel Shingles were the first **lightning proof** shingles in Canada---and are just as far ahead of others to-day---in fact with an "EASTLAKE" Roof you need no lightning rods.

There are many other exclusive advantages I have experienced in using "EASTLAKE" Steel Shingles that I have no room to mention here, but if you are interested in building or roofing write to-day for free booklet and full information.

BRANCH FACTORY: WINNIPEG AGENTS IN PRINCIPAL CITIES

No Disgrace to Her Breeder.

Minnie Poetess 11824, a two-year-old Holstein heifer, bred by Logan Bros., Amherst, N. S., and sold to the Mental Hospital Colony Farm, Mont Coquitlam, B. C., has made a record in the dairy test at Coquitlam of 18¼ pounds of butter in seven days. This heifer is sired by Mercena Posch and is out of Minnie Rooker's Poem 7099. Both sire and dam also belong to the Colony Farm, and the three animals were noted prize winners at all the western shows last summer.

It requires many years of patient work to build up a profitable dairy herd. It can be done only by knowing precisely what each cow is producing.

Never let the heifer become more than three years old before breeding. Cows which have been bred young are usually good milkers.

Keep the heifer intended for the dairy in thrifty, growing condition.

Milk quietly, cleanly, quickly. Cows hate haste.

Sprained Tendon.

A. B. W.: I have a valuable mare, eight years old, that two weeks ago sprained or bruised the back tendon of her near forleg. She was a little lame the first two or three days. Since then she has had no lameness, but the parts have been highly fevered. I have used cold water and flannel bandages, under which treatment the swelling will go down but as soon as I take it off it will swell again. I have bathed it with alcohol and water, tincture of myrrh and water, and laudanum and water, but nothing appears to do it good. I now have swamp moss and vinegar on. She stands in a box stall day and night.

Please let me know what is best to do.

Answer: You are too impatient. You say the mare is suffering from sprain of the back tendons. Now the cure of a severe sprain of these tendons, under the most judicious treatment, is not a matter of days or weeks, but often of months. A sprain consists of a lesion or rupture of more or less of the fibres of the tendon, and the reparative process is always tardy in proportion to the extent of mischief. Absolute rest and the use of cold and hot baths, alternately, until all sign of inflammation has disappeared, will be the safest treatment.

Homesickness.

A. W. B.: I have a horse that seems to be perfectly well, but will not eat, He is a new purchase. He felt well at his old home, but will not eat with me notwithstanding I change his food with a view to encouraging an appetite. I had occasion to stay away from my stable one night, and he ate well enough while away, but on returning absolutely refused to eat. Is there such a thing as homesickness in horses, and do you think he could be a victim to it?

Answer: We believe horses are sometimes affected with homesickness, and loss of appetite is a prominent symptom of the same. After he gets used to his new surroundings the the trouble will be gradually overcome, by kindness, etc. Cut down his quantity of food two-thirds for a few days, until he becomes a little hungry, and in the meantime place 25 drops of tincture of nux vomica in a quart bottle, fill with spring water, and give him one-half ounce on his tongue three times a day, one-half hour before feeding time, as an appetizer.

Acute Pneumonia.

J. W. B.: I had a horse recently die under rather peculiar circumstances and I would like te know your opinion in regard to the cause. He apparently contracted a cold, was a little feverish anp slightly sick for four days, then seemed to get well, at least, he ate and acted well for three days, then suddenly began to breathe hard, appeared very sore about the chest, assumed a disturbed appearance and refused to eat, This appeared in the morning, and during the night he died.

Answer: He simply had an attack of pneumonia; the lung cavity filled and he died from suffocation.

Excision of the Ergot.

Old Subscriber: Will you inform me if there is any harm in cutting off that bad substance a growth, that projects from the center of the horse's fetlock in the midst of the long hair that grows from that part?

Answer: This being a non-sensitive, semi-ebony growth, it can be removed with impunity and without any risk or inconvenience to the patient.

For a sprain you will find Chamberlain's Liniment excellent. It allays the pain, removes the soreness and soon restores the parts to a healthy condition. 25 and 50 cent bottles for sale by all dealers.

Side Puller.

I have a mare that pulls upon one rein and to an extent that makes it unpleasant to drive her. Can you give a cause for it, and the remedy?

Answer: There is always a cause for this pernicious habit, but not always apparent to the observer, sometimes being due to a badly-fitted bit, and again to pressure upon a soft part. The mouth should be carefully examined by a competent person and whatever may be found wrong made right. A frequent source of annoyance is found on the under jaw and where the lip usually rests. If a horse has a tendency to pull, the bit may, and, in fact often does, bruise the bone under the mucous covering, without showing any external evidences of the same. This may, however, be determined by pressing upon the parts with the fingers, when, if painful, the animal will evince it by resisting. We have remedied this by cutting boldly down on the bone, washing the opening out, and using antiseptics for a few days. If, however, after a careful examination you fail to find anything wrong with the mouth change the bit and the chances are you will find one more to the liking of the animal.

Buy Government Standard Seeds

Established 1856

Accept no other. You don't have to. If your dealer does not handle "SIMMERS' SEEDS" send your orders direct to us and they will be filled with seeds that conform in every respect to the standard of germination set by the Government. **This is most important.** Don't buy seeds without a reputation behind them.

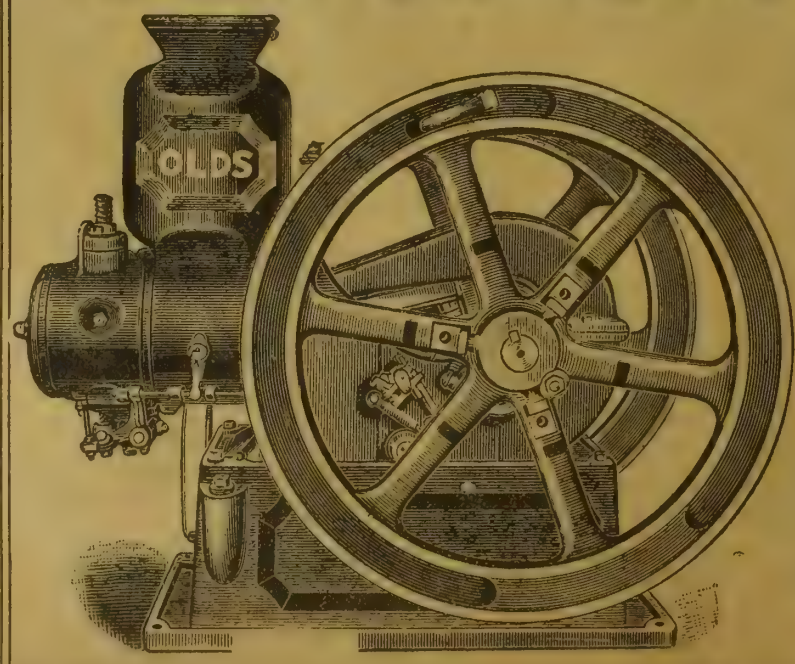
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

In the March of Agricultural Progress.

IN THE MARCH OF AGRICULTURAL PROGRESS.

As time rolls on and the great question of how to feed the ever increasing population of this great country confronts us, the ready answer and solution to this vital problem is embodied in the few words, "Improvement of Agricultural Conditions."

The mere acquisition of a section of land means little unless the proper equipment is put with it to concentrate the productiveness of the ground. One of the first and most important features of the up-to-date and profitable farm is proper fencing. This is not a trivial matter by any means, but a hard, cold fact that only properly fenced farms are the exclusively profitable ones.

It is just as necessary for a farm to have proper fencing as it is for a river to have banks, the house to have walls, the corn crib to have sides or the barn to have stalls, not mere fence but real fence.

Now you ask if fencing is to vital what kind of fence should be used, and why aren't more concerns laying greater stress on the importance of this article and manufacturing it? We will deal with each phase of the question for you.

It is only natural in some localities to pile up stones gathered up and make a stone wall because the stones happened to be there. But what have you when your hard work is done? A boundary it is true, and also a very comfortable home for weasels, skunks, rats and other destructive animals to propagate and rank weeds to grow in the crevices. And besides, the ordinary stone fence is three feet wide and so wastes enough land to plant at least one row of roots and even more of small grains and then the stones are continually falling or rolling into the field to be struck by the plow share or harrow blade and injuring them, and sheep and cattle will climb over stone walls.

We are confronted with similar conditions in the use of stumps witn their protruding prongs and rotting hollows.

Then, take rail and board fences, they are always needing repairs, the wind blows them down and the rain and snow rots them. You go to bed and during the night a stray spark from a locomotive has nestled on your board fence and lo! your farm is fenceless, your cattle and sheep miles away and your crops trampled to destruction. You have to round up stock and stop work when your harvesting is at its height. Lumber is getting higher in price and poorer in quality each year and does not give real fence service.

Then the logical and only material for fencing purposes must be wire—not just so many feet of mere wire hitched to a few posts, but steel wire properly galvanized and constructed into a fabric of horizontal and vertical wires that will withstand the elements, turn attacks of cattle and restrict the roaming of the smaller chick.

The manufacturer of dependable wire fencing must consider the article he intends to produce from all angles.

The first consideration that must be made is the kind of wire to use.

It is conceded that steel wire is the thing but as there are numerous grades and qualities we must select the kind that will fulfill all requirements. It must be strong enough to withstand strains and attacks from cattle and elastic enough to adjust itself to sudden changes of temperature, and not snap from quick contractions. Then, the wire must be smooth so as to galvanize thoroughly and permanently.

Galvanizing is a very important part of wire fence construction because if for any reason this coat of galvanizing chips, peels, or flakes off, the wire rusts and breaks.

Now that we have the wire, next comes the method of construction. Dependable fencing must be vertically rigid as well as literally strong. This means upright wires so joined to the horizontal ones that the completed fence can be erected on rolling ground without buckling or cutting the wires. These are the things that are not considered by the average manufacturer.

Fortunately for Canadians, several concerns in this vast domain have made a thorough study of fence conditions and produce a grade of wire fencing that meets every requirement of the up-to-date farm. These concerns will gladly furnish you with complete information and catalogues of any kind or style of fence for all purposes if you will address them. You will find their names and addresses in their respective advertisements in the columns of the Maritime Farmer.

The Residual Effects of Fertilizers.

Extract From

"A Farmer's Field Tests"

By B. Leslie Emslie, C.D.A. P.A.S.I., F.C.S.

The residual effects of fertilizers seem to be rarely taken into consideration by experimenters, and yet how important they are, as we shall endeavour to prove. How frequently we find the efficacy of a fertilizer measured only by the results produced in the season of its application, whereas if means were taken to ascertain its after-effects, it would be found effective for at least three subsequent seasons. This is certainly true of the mineral fertilizers, although not in the case of Nitrogen, which gets leached out of the top soil.

Now, the "Agricultural Holdings (Scotland) Act," which provides compensation for unexhausted improvements being paid to an out-going tenant of a farm, assumes in its scale of compensation that fertilizer materials are exhausted at the following rate:—

Fertilizer Applied.	Rate of Exhaustion.
Nitrate of Soda. Sulphate of Ammonia.	On arable land entirely exhausted by first crop.
Acid Phosphate, and all Potash Fertilizers.	On arable land half exhausted by first crop, and quarter of remainder by each succeeding crop.
Basic Slag Dissolved Bones.	On arable land one-thire exhausted by first crop, and quarter of remainder by each succeeding crop.

From this table can be seen the estimated period of efficacy of some of the more popular fertilizer materials in a moister climate than ours, so we would naturally assume that in this country the effects would be even more prolonged.

FREE copies of this and other bulletins treating of the important subject of Fertilizing may be had on application to

A SMALL CROP IS A WARNING

A small crop is proof that your land is run down—it is a warning to fertilize promptly.

Manure is the ideal fertilizer because it contains the very elements that crops have extracted from the soil. To get 100 per cent value from the manure you spread, you must use a good manure spreader. The pitchfork method is wasteful, entails hard, disagreeable work, and takes too much time.

When buying a spreader, be sure you get one that will last. You can make sure of the quality, efficiency and durability, by investing in one of the

IHC Spreaders

Corn King Cloverleaf

These spreaders are used on thousands of farms. Their strength, simplicity, and durability are matters of record. Why not look into the matter?

When investigating, remember that the power transmitting mechanism used on I H C machines is the most durable used on any line of spreaders. This results from the fact that the beater gears are held in a single casting which prevents them from springing out of alignment and cutting the teeth. The teeth are long and chisel-pointed to insure positive pulverizing of all manure. There is no wedging of manure against the beater bars. The teeth do not rim the bars. The beater is large enough in diameter so that it does not wind. You will find many other striking advantages which will convince you of I H C superiority.

Why not see the I H C local agent at once? I H C spreaders are made in different styles, in many sizes for every need. If you prefer, write nearest branch house for catalogues and full information.

BRUCE'S SEEDS

THE STANDARD OF QUALITY SINCE 1850

An experience of over sixty years in the seed business in Canada, and our long connection with the best growers of the world, gives us an advantage which few seed houses possess: added to this our careful system of testing all our seeds for purity and germination, and the great care exercised in every detail of our business, brings to us every season many pleased customers to add to our already large list of patrons.

SHOPPING BY MAIL

is a most fascinating, enjoyable and profitable pursuit. You can, in a few days with perfect safety, though far removed from the source of supply, have delivered at your door Bruce's Seeds—The seeds that satisfy. All you require to do is to send us a postcard asking for our handsomely illustrated 112 page catalogue of Seeds, Plants, Bulbs, Implements and Poultry Supplies which we will mail FREE OF CHARGE and on receipt of same send us your order. Write for it now to

The National Live Stock Breeders' Association.

(Continued from page 334).

carrying out the Record of Performance tests";

"That whereas the express rates in various sections were excessive, especially on the rates for shipping sheep and swine from one province to another committee to be appointed to approach the railway companies with a view of securing equal rates for all sections of the Dominion";

"That whereas legislation in regard to stallion registration has already been effective in improving the standard of the stallions in the four provinces in Canada and the system is improving the service of stallions for breeding purposes in these provinces, it be recommended that the government of the remaining provinces be urged to pass legislation re the control of stallions kept for public service";

"That the Minister of Agriculture be commended for his suggestions in a recent address where he stated that he proposed dividing his department between two deputies, one to have charge of the live stock exclusively and that it is the wish of the association that he will complete the work as he suggested. That he appoint a bureau of live stock industry comprising a permanent chairman and four members, one to represent the West, one the East and two to represent the central portions of the Dominion, and whose duty it shall be to regulate, encourage and foster in every way the interests of the live stock industry, subject to the sanction and approval of the Minister of Agriculture";

"That whereas it is greatly in the interests of the horse breeding industry in Canada that every opportunity be given to enable farmers to breed their mares, both grade and pure-bred, to pure-bred stallions and, whereas the only opportunity of accomplishing this is by shipping mares to these centres where such stallions are kept that the association urge upon the management of railroads in Canada to make such provision that mares shipped to be bred to such stallions be returned free":

"That it is the opinion of this committee that the Dominion Government should at the earliest date inaugurate a policy having for its object the control, as far as possible, the eradication of Bovine Tuberculosis on the lines recommended in the report of the International Veterinary Commission";

"That the present act as it stands be amended to in regard to importations of stock that the privileges of lower rates of duty be extended to British subjects residing in Canada."

The election of officers and directors took place at the evening meeting of the association, and the following is the list:—

President, Andrew Graham, Pomeroy, Manitoba; vice-president, John Bright, Myrtle, Ont.; executive committee, Hon. W. Garneau, P. M. Bredt, Regina, Sask., and Capt. T. M. Robson, London, Ont.; Secretary-treasurer, A. P. Westervelt, Toronto; directors, British Columbia, A. D. Paterson, Ladner; Alberta, John A. Turner, Calgary; Saskatchewan, Robt. Linton, Regina; Manitoba, A. McPhail, Brandon; Ontario, W. W. Ballantyne, Stratford; Quebec, Victor Sylvester, Clarvaux; New Brunswick, Lieut.-Col. Campbell, Apohaqui; Nova Scotia, M. Cumming, Truro; Prince Edward Island, Hon. M. McKinnon, Charlottetown.

Flax Growing.

At the recent Nova Scotia Farmers' Association held at Yarmouth, N. S., a letter was read from a gentleman who is interested in the growing of flax and the manufacture of oil. Prof. Grisdale, in referring to this subject said:—

"The subject which has been introduced in this letter is one of considerable importance in Canada. The production of flax seed in Canada has been increasing quite rapidly of recent years and is likely, in my opinion, to still further increase in the next few years, but I may say that the production of flax has not been increased in the Eastern Provinces, but rather in the new provinces on new soils. The flax seed industry, which has for its object the extraction of linseed oil and the crushing of the cake and selling for stock feeding purposes, is a most profitable one, if one may judge from the companies which are already interested in this line of work. If you have a club of men or capitalists interested in this line, or interested in introducing some new line that would be of advantage to the town and of value to the district and of interest to the farmer in Nova Scotia, I do not know of anything that is more likely to meet with success than this same oil expressing industry.

You, being situated on the seaboard, have opportunities of securing this seed at a lower cost for transportation. Ships reach many points where the seed can be produced cheaply and by means of these ships, transportation to these shores is very cheap. Once the oil is expressed, the cake is of much greater value here than in most countries where the flax is produced, hence the transportation charges might as well be saved, because many of the shipments are handled some two or three times between the producer and the consumer on the dairy farm. I am of the opinion that a great deal of flax can scarcely be grown here, but I am still of the opinion that such an industry would be profitable and could be carried on to great advantage in view of the great market that does exist and is likely to be still further created.

Flax is not likely to be grown to any great extent in these Maritime Provinces, not because of climatic and soil conditions, but due to the effect that flax has upon the soil. Flax is one of the most exhausting crops that can be grown as far as soil fertility is concerned. On the Western prairies where none of the fertility which has been gathering for ages has been used, it is only the first plowing that is used for flax. The idea is to plow fairly deep, and then harrow with a disc harrow and sow the flax. These conditions supply an immense amount of food for the crop and help the sod for the ensuing crop of wheat. Sometimes it is introduced further on in the crop season.

Flax has been found to be rather an exhaustive crop and is not extensively cultivated in the West, even though it is as profitable as wheat. We grow it in greater or lesser quantities on our experimental farms, particularly in the prairie provinces. We have found it quite as profitable as any other grain crop grown, but not more profitable than wheat or oats because the straw is of small value. No way has been found of utilizing straw on the Western farms to any appreciable extent. A movement of men think they have invented machines for taking the pulp out of the fibre in the flax straw and using this fibre for the manufacture of fibre twine. I do not know that they have made a real success. If they could, the production of flax would be increased because there would be a market for the straw as well as the grain. The returns are fairly good. Sometimes the price is $1.50 per bushel, and next year $2.50 or $3.00 according to the crop in other parts of the world.

FREE TO MEN

You Yourself Can Restore Your Vitality

VITALITY is the greatest power in the world. If I renew your VITAL VIGOR I restore you to full and complete manhood. No matter what your age, whether you are young or elderly; no matter what early indiscretion may have sapped your courage. If I resupply you with new VITALITY I give you the strength that all healthy, vigorous men possess. I know the source of this VITAL SUPPLY. My HEALTH BELT, with suspensory attachment, pours a great stream of VITALITY into your system hour after hour all night while you sleep. Thousands have said it immediately benefits and takes the pain and weakness out of the back from one night's use. No drugs, no medicines, no restrictions of any sort excepting that all dissipation must cease. The man who indulges an excesses and unnatural practices can never be other than a weakling, but if you promise me as man to man that you will be decent, take ordinary care of your health and then use my HEATH BELT every night for 60 to 90 days, I should then be able to do in your case exactly what all these other thousands of men have said I did for them. Please write for my booklet to-day. Never mind about purchasing a Health Belt now; first get into communication with me, read what my book says, then later, if we decide between us that you should have a Belt and if you decide that you want to use it, I will arrange for you to have one to wear until you are cured. My Health Belt is the greatest vitalizer the world has ever known. With special attachments it is a remedy for kidney, liver, stomach, bladder disorders, rheumatism. etc.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man, young or old, who would be strong in manly vigour. It is a word of hope, a carefully written, interesting booklet which should be in every one's possession. Therefore, send to-day. If in or near the city, call at my office. Hours 9 to 6

A New Industry Opening at Sydney.

The Cross Fertilizer Company of Liverpool, London and Glasgow have opened and are operating a fertilizer factory at Sydney, N. S., for the manufacture of Basic Slag. Mr. Walker, the director in charge of the works, is from the Old Country, but has come to make his home in Canada. The parent house has been established for 100 years and their entrance to the Canadian field began with a visit of the senior member of the firm, Mr. Alex Cross and Mr. Walker to Sydney in 1910. In the following May they commenced to erect their plant and warehouses and to-day they have everything in running order to produce 1,000 tons of Basic Slag fertilizers per week. There should be a market in the Maritime Provinces for all the Sydney works can produce and once the farmers realize its worth they will not permit a pound of Basic Slag to be sold outside these provinces.

The raw material for the Cross Fertilizer Company is obtained from the Dominion Iron and Steel Co., Sydney. It is a by-product of their plant. The new company has expend-

ed nearly a quarter of a million of dollars in their Sydney works and warehouses so they must have considerable confidence in the future of their industry in this country or they should never have done that. As an evidence of their storage capacity for the finished product they have a warehouse 365 feet long and 150 feet wide, a very large building, but small enough, Mr. Walker thinks for the business that is in prospect.

Mr. Walker is now opening a sales connection with the different agricultural centres of the provinces. Any of our readers who think they could handle a car of the Sydney Basic Slag should drop Mr. Walker a line to Sydney.

The N. B. Provincial Dairy School.

The next session of the New Brunswick Dairy School will open at Sussex on March 19th next, when there will first be a ten days course in butter making both for creamery and home butter makers, with a full course of lectures upon the production and care of milk and cream, covering the selection, testing, care and feeding of dairy cattle as well as the prevention of and remedies for common ailments. Instruction will be given on the care and operation of hand and factory separators and for those who desire it, there will be training in soft cheese making for home dairies.

During this course, to which ladies are especially invited, lectures upon the production and marketing of poultry and eggs will be given by Seth Jones, Provincial Poultry Superintendent. Lectures upon animal and field husbandry will be given by Prof. E. S. Archibald and on Veterinary Science by Prof. John Standish, both of the Nova Scotia Agricultural College. This course will close on the 29th March, and on the 2nd April a course in cheese making will begin continuing till April 12th. During both courses, instruction in milk testing will be given. It is expected that all those who are intending to operate creameries or cheese factories will attend one or both of these courses. Tuition is free and board can be obtained at reasonable rates.

The staff in addition to the special lecturers above mentioned, will consist of C. W. McDougall, Superintendent and Lecturer; L. C. Daigle, instructor in milk testing and cheese making; George Ransom, instructor on Hand Separators; Albert Conrad, instructor in butter making. Applications stating which course the applicant desires to take, should be sent to C. W. McDougall, Supt., Sussex, N. B. from whom all information may be obtained.

The Co-Operation of Federal and Provincial Departments For Agriculture.

C. C. James, for some 25 years Deputy Minister of Agriculture for Ontario, has been appointed by the Dominion Government a special Commissioner to inquire into the whole question of Federal and Provincial co-operation in the encouragement of agriculture.

It is probable that, after this duty has been fulfilled Mr. James will be appointed Deputy Minister of Agriculture for the Dominion.

In introducing a bill in the Dominion Parliament for the appointment of Mr. James as special commissioner in the meantime, Hon. Martin Burrell, Minister of Agriculture for the Dominion, said there had been a lack of full co-ordination in practical agricultural work and legislation between the Dominion and Provinces. A maximum of harmonious co-operation and a minimum of friction between the various parts of Canada would be impossible until means had been secured for laying a sound foundation for permanent legislation. It appeared to the Government that this purpose could best be attained by securing the services of a man of practical experience and broad grasp of agricultural questions, whose duty it would be to become thoroughly conversant with the conditions and methods of the different Provinces in regard to agricultural work, so that the Government might be placed in a position to formulate a scheme which would be truly co-operative, which would eliminate duplication of effort and promote efficiency and progress all round. The Government believed it had found such a man in Mr. James. "His reputation," said Mr. Burrell, "is more than a Provincial one, and I think the House wil, agree that substantial benefit will accrue to the country as a result of appointing Mr. James Special Commissioner for this work."

For the present, and until a general policy of co-operation with the Provinces has been worked out, it was proposed that the Federal Government should make money grants to the various Provinces on the basis of population. No Province would be favored above another. "We recognize," said Mr. Burrell in conclusion, "that in every Province a Government has been placed there by the people, and I am voicing the sentiments of the Prime Minister and his colleagues in saying that the sole purpose of this measure is to do what the title declares it is designed for, to aid and encourage agriculture."

The Ontario Government has made its choice of a successor for Mr. James. The mantle has fallen on J. Lockie Wilson, Superintendent of Fairs.

How Much Does it Cost By the Year?

The first price of a cream separator is no basis for figuring its cost. Suppose you paid $2 for a pair of shoes which, with $1.00 worth of repairs, lasted 12 months, making an average monthly cost of 25 cents. At another time, you paid $3 at the start, only 50 cents for repairs, and the shoes lasted 24 months—an average cost of less than 15 cents per month. Which was the better buy?

The same principle holds good in cream separator buying. You may pay a low price at the start—but such a separator will need frequent repairing—and won't last. The cost per year will be double that of a good separator.

I H C Cream Harvesters
Dairymaid and Bluebell

are famous for their durability. They skim close and run easy for years. They are built for long, hard, steady service. Here are some of their advantages:

Milk and dust-proof gears which are easily accessible—a feature found on no other separators; a patented dirt-arrester which removes the finest particles of dirt before the milk is separated; frame entirely protected from wear by phosphor bronze bushings; large shafts, bushings, and bearings.

I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes. Let the I H C local agent tell you all the facts, or, if you prefer, write nearest branch house for catalogues and any special information you desire.

Vanco Did it

When the Buds on your fruit trees are swelling, spray the trees from the top to bottom with

"Vanco" Lime Sulphur Solution

Clean trees mean sound fruit. Spring spraying means fall profits.

San Jose Scale, Apple and Pear Scab, Aphis, Fire Blight, Mildew and other Fungi attack fruit trees before the leaves come out.

The time to attack them is before they can damage the tender buds.

One spraying before the leaf buds burst, and another just before the blossoms come out—with perhaps a third when most of the blossoms have fallen—will mean hundreds of dollars profit when the fruit is ready for packing.

"VANCO" LIME SULPHUR SOLUTION is a true chemical solution of uniform strength and efficiency. It is prepared by scientific men in a scientific way—with the specific gravity on every barrel.

It does away with all guess-work—saves the trouble of home-boiling. It is ready for use after mixing with water—has no sediment—sprays easily—and does not clog the nozzle.

You get results when you spray with "VANCO" LIME SULPHUR SOLUTION—because it is strong, uniform, clear, efficient.

FERTILIZERS—We are the only house in Canada selling only the straight Fertilizing Chemicals—Nitrate of Soda, Muriate of Potash, Sulphate of Potash and Acid Phosphate.

YOU CAN SAVE FREIGHT by buying your Fertilizers and Spray Chemicals together, and have all come in one shipment.

WRITE FOR THE "VANCO" BOOK, and turn the information it will give you into dollars. We'll gladly send you a copy, free.

CHEMICAL LABORATORIES LIMITED, 138-148 Van Horne St., TORONTO.

How to Keep the Boys on the Farm.

Editor Maritime Farmer:—

It is my object to show how we may lessen the growing tendency in young men and boys to abandon the beautiful and ennobling cares of the farm for the dangerous excitement of city life and trade. If we would keep our boys on the farm we must attempt to do three things:—Abate the task work of farming; raise maximum crops at a profit, and surround the work with the exhilaration of intellectual progress.

It is often the case, among the smaller farms that they cannot raise large enough profits from the surplus farm products to buy all the necessary requirements of the family. The boy, as soon as old enough to hire out, engages with some neighbor for a month or so to earn the money needed for clothing or other necessaries. He soon becomes more interested in his neighbor's work than his own and eventually "leaves home" as soon as he is old enough to get steady work.

Try and make the small farm produce surplus enough to meet the requirements of the home. Do not let the boy hire off the farm for one day. Even one day may prove long enough to sow the seed of discontentment in his heart. Buy him the things he needs and spare him a little pocket money.

Many a son, of a stern parent, leaves home because he is not allowed a day with his companions. The father denies the boy a day's freedom and the boy in his anger and disappointment deserts home. I would say to every father to allow the boy a day's pleasure once in a while; the son will come home a happier and more contented boy.

Give the boy something on the farm that he may call his own, something to encourage and interest him. Show him he is not working for nothing.

It is a common occurrence among our farmers to refuse to give their sons any portion of their property until long after they have attained their maturity. This is not conducive to the multiplication of farmers, and by this we lose not only many of our farmers, but very many leave our country. Let me give you one of Howard Trueman's illustrations: "Farmer Jones has a grown up son, steady and industrious, who suddenly becomes morose and dispirited. His father cannot tell what is the matter with John, but

"The mother with a woman's wiles
can spy
What makes the youth so bashful
and so grave,"

and very soon is in possession of John's secret, which in substance is, he has taken a liking to Squire Smith's daughter, and would like to start in life for himself, wife and all. In due time Mrs. Jones informs Mr. Jones of the nature of John's ailment and what will cure it. The very idea of John wanting a wife! of John wanting to settle! pshaw! Thus the matter ends with Mr. Jones but not with John. Very soon it is reported that John Jones is going to the States, and when our Johns go to the States they don't very often return."

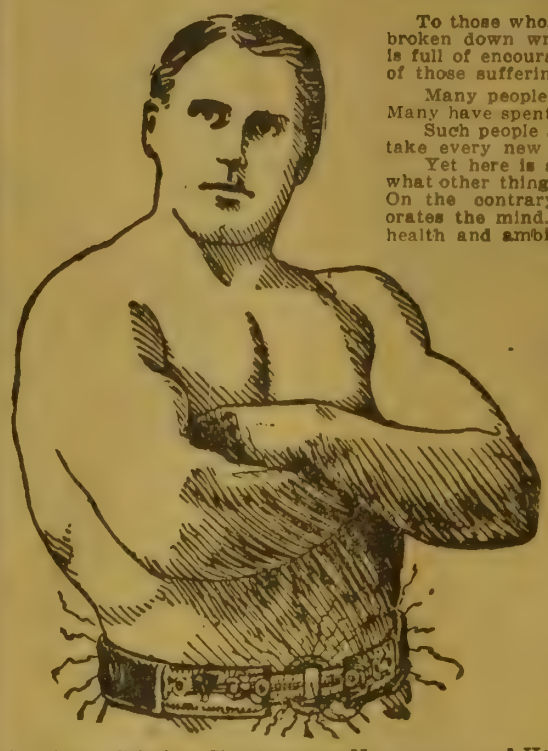
Another thing, do not isolate the boys from companions; no young person of intellect is contented to remain at home with his parents. If he cannot have company come to his own home he is going to go to "Squire Smith's" and find it. Invite those to your home in the evenings whom you think proper associates for your young people and permit your son to go to convenient places of entertainment.

Let the country boy be as well educated for the farm as his city cousin is for the bar or counting room. But the farmer's son must not receive his education in an art college, boys trained in these institutions very soon lose their interest in the farm; the student thus favored usually finds that his increased knowledge and power to think enables him to earn a larger income in some other business. Let him be trained in an Agricultural College, where the education of mind and muscle are carried on simultaneously and any taste previously acquired for the cultivation of the soil shall be intensified.

Farming and farm life have always been popular, but so long as the young look upon farm work as a sort of drudgery and as not over respectable and so long as the returns in money are small, how are the new fields to be made to smile into harvest and the worn out fields to be restored to fertility? Of all occupations, that of agriculture is best calculated to induce love of country, and rivet it firmly on the heart. No profession is more honorable, none as conducive to health, peace, tranquility and happiness. The farmer stands upon a lofty eminence and looks upon the bustle of the city, the din of commerce, and brain-confusing, body-killing literature, with feelings of personal freedom, peculiarly his own.—Hazel L. Baxter.

DR. McLAUGHLIN'S ELECTRIC BELT

IS MADE FOR YOU



To those whose vitality is exhausted and who find themselves, young in years, broken down wrecks of what they ought to be, the Dr. McLaughlin Electric Belt is full of encouragement, It it the success of the age in elevating the condition of those suffering from a loss of vitality.

Many people would give all they possess to regain the health they have lost. Many have spent their last cent in its pursuit—and thrown their money away

Such people are misled by custom and the well-meant advice of friends. They take every new drug under the sun andfind them useless.

Yet here is a simple, natural remedy, Dr. McLaughlin's Electric Belt, that does what other things fail to do. It does not poison the system nor depress the spirits. On the contrary, it starts the life current anew and produces health. It invigorates the mind. Without knowing how, the patient jumps from despondency to health and ambition.

There is nothing wonderful in this change. It is all so natural. Think what the effect would be if you were suddenly deprived of all the electricity in your body. You could not live an instant. No mental or physical life could exist without Electricity. Naturally, when the amount is below normal you are less vigorous, less ambitious.

Then is the time my Belt does great things for you. It recharges your nerves with life-giving current. Soon strength and vitality are restored. You feel the old, stimulating glow of health. You now have the right amount of Electricity, and you feel "equal to anything."

What is my Belt? It is a body battery, made for the purpose of applying Electricity to the human system in the most scientific and effective way. It is made on an entirely different plan from the worthless devices known by "Electric Belt." Its current is of guaranteed strength and constancy. It is provided with a regulator. This enables you to change the current to suit varying needs. You wear it at night. Its soothing currents send you to sleep. You wake up refreshed and invigorated. Before long you feel like a different person—and you are different. Your friends tell you so.

The benefits of my Belt are being daily demonstrated by thousands of patients, and it is heartily endorsed by those who have been cured.

If you are sick or weak, and your doctor isn't helping you much, you ought to try my Belt. It's a grand remedy. All such troubles as Indigestion, Constipation, Torpid Liver, Tired Feeling, Weak Kidneys, Rheumatism, Neuralgia, Lame Back, Lumbago, Sciatica, Sleeplessness, Nervousness and Headaches are cured completely with Electricity applied with my Belt; it overcomes all signs of weakness or breakdown in men and women. My Belt not only cures the sick, but gives the well a greater zest in life.

If you haven't confidence in Electricity, let me treat you at my risk. I will give you the Belt on trial, without one cent of risk to yourself. Give me reasonable security; and I will take your case, and you can

PAY WHEN CURED

Dear Sir,—I have had your Belt in my home for some little time; my family have used it, also myself; and I find it a great cure. We could not do without it.

Yours with much respect, Mrs. R. E. McElroy,
Arcola, Sask.

Dear Sir,—I beg to report that the Belt I received from you some time ago is doing good work, and wish to say that I am feeling better in every way. My stomach is very much better; also my nervousness is rapidly leaving. I can now sleep quite soundly and get up quite refreshed. Sincerely yours, C. E. Scantlebury,, Supt. Ry. Mail Service, Calgary, Alta.

Dear Sir,—I have felt no pains in my back since I discontinued to wear your Belt some months since. I must say it was a marvel how quickly it effected a cure on me and I shall have great pleasure in recommending your Belt to any one who suffers from a bad back. Thanking you, I beg to remain. Wm. Butters,
Gull Lake, Sask.

Dear Sir,—I am glad to say that I am completely cured of my Rheumatism by the use of your Belt. I certainly felt the benefit of it and am glad to say I am quite clear of Rheumatism and my Belt is worth more than what I paid for it. You can refer any sufferer to me who is in doubt. Wishing you every success, I remain,
Ed. Johnson, 109 Elmwood Ave. E., Winnipeg, Man.

FREE BOOK.

If you cannot call and see me personally, you can write for my book. It will cost you nothing, and will tell you lots of things you ought to know. Send coupon for this beautifully illustrated 84-page Free Book to-day, "Electricity is Life." POULTRY AND POULTRY PRODUCTS—Fowl, $1.25 to $2.00; Chickens, $1.25 to $2.00; Geese, $1.50 to $1.75; Turkeys, 28c. to 30c.

MISCELLANEOUS—Hay, $12.00 to $14.00; Wool, 14c. to 21c.; Beef Hides, 11½c.; Calf Skins, 16c.; Sheep Skins, 30c. to 90c.; Lamb Skins, 30c. to 90c.

VEGETABLES—Carrots, $1.35 to $1.50; Potatoes, $2.80 to $3.00; Turnips, 90c. to $1.00; Beets, $1.25 to $1.50.

Market conditions have not been very brisk during the past week. The price of butter and eggs is moving upwards. Prices of all kinds of meats are holding their own. Potatoes are steady at $2.80 per bbl. of 180 lbs. The cargo of Irish potatoes landed this week is holding the prices down. Eggs are scarce and selling from 35c. to 40c., fresh, per doz. Mutton is moving upwards as the cold storage stock is about done.

Halifax.

GRAIN—Oats, 57c. to 58c., bagged; Peas, in bbl. 196 lbs., $6.25 to $6.50; Barley, in bbl., $6.75 to $7.00.

FEEDSTUFFS—Bran, $27 to $28 ton; Shorts, $28.50 to $29.50 ton; Middlings, $29 to $30 ton; Oil-cake, $2.35 to $2.40, bag 100 lbs.; Cotton Seed Meal, $1.75 to $1.80, bag 100 lbs.; Gluten Meal, $34 to $35 ton; Corn Meal, $1.75 to $1.80, bag 98 lbs.

GRASS SEEDS—Timothy, 19c. to 20c. lb.; Com. Red Clover, 23c. to 25c. lb.; Mam. Red Clover, 23c. to 25c. lb.; Alsike, 20c. to 21c. lb.

DRESSED MEATS—Beef, (carcass), 8½c. to 12c. lb.; Beef, (retail), 16c. to 20c. lb.; Pork, 10c. to 15c.

HORSES—Drafters, $150 to $250; Roadsters, $200 to $300.

DAIRY PRODUCTS—Creamery Butter, 31c. to 33c. lb.; Dairy Butter, 28c. to 30c. lb.; Cheese, 16c. to 16½c. lb.

POULTRY AND POULTRY PRODUCTS—Eggs, 30c. to 33c. doz.; Fowl, 12c. to 16c. lb.; Chickens, 14c. to 17c. lb.; Ducks, 15c. to 16c. lb.; Geese, 15c. to 16c. lb.; Turkeys, 22c. to 23c. lb.

FRUIT—Apples, $2.50 to $4.00 bbl.

MISCELLANEOUS—Hay, $13 to $15 ton; Straw, $8.50 to $9.50 ton; Beef Hides, 11c. to 11½c.; Calf Skins, 15c. to 16c.; Sheep Skins, 80c. to 90c.; Lamb Skins, 80c. to 90c.

VEGETABLES—Carrots, 70c. to 80c. bus.; Potatoes, 75c. to 80c. bus.; Turnips, 45c. to 50c. bus.

Charlottetown.

GRAIN—Oats, white, 48c.; Black, 50c.

FEEDSTUFFS—Bran, $1.40 to $1.50; Shorts, $1.50 to $1.60; Middlings, $1.55 to $1.60; Oil-cake, $2.45 to $2.50; Corn Meal, $1.85 to $1.95.

GRASS SEEDS—Timothy, 16c. to 18c.; Com. Red Clover, 26c. to 28c.; Mam. Red Clover, 26c. to 28c.; Alsike, 25c. to 29c.

LIVE STOCK—Butcher's Cattle—5½c. to 6c., live; Stockers, $18 to $40; Milch Cows, $25 to $45; Sheep, 3½c. to 3¾c.

DRESSED MEATS—Beef, (carcass), 6½c. to 9c.; Beef, (retail), 8c. to 15c.; Mutton, (carcass), 7½c. to 8½c.; Pork, light, 7c. to 8c.; select, 8c. to 8½c.; heavy, 6¾c. to 7c.

HORSES—Drafters, $150 to $225; Roadsters, $150 to $225.

DAIRY PRODUCTS—Creamery Butter, prints, 33c. to 34c.; solids, 32c. to 33c.; Dairy Butter, prints, 25c. to 30c.; tubs, 25c. to 26c.; Cheese, 15c. to 15½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 25½c., wholesale; retail, 30c.; Fowl, 8c. to 11c.; Chickens, 10c. to 13c.

FRUIT—Apples, $2.00 to $3.50.

MISCELLANEOUS—Hay, $12.50 to $14.00; Straw, $6.00; Wool, 25c.; Beef Hides, 10c.; Sheep Skins, 65c. to 80c.; Lamb Skins, 60c. to 70c.

VEGETABLES—Carrots, 50c. bus.; Potatoes, 40c. bus.; Turnips, 16c. to 20c. bus.; Beets, 50c. bus.

Since last report trade has been quiet and prices remain about the same with slight advance in some lines. Pork has come out in very limited supply and in consequence the price has held firm at slightly higher price but the advance is not warranted by market conditions elsewhere and is being paid only because the supply is not sufficient to fill the demand for local orders. Packers are not willing to take select hogs at over 8c. and not particularly anxious for them at that price. In quoting Charlottetown prices on Dressed hogs it must be remembered that this is for hogs dressed for inspection with heart, liver and lungs attached and the price is for gross weight which means ¼ to ⅜c. per lb. more for net weights. Butter is also scarce and prices are higher. Dressed beef is quiet with quality below the average. Eggs are in very limited supply and prices vary in retail way but shippers are paying 25½c. Vegetables are not offering at this season except in a retail way by stores and market gardeners, but it looks like higher prices for all kinds of vegetables for spring. Pressed hay is in demand for local use and prices being paid are not warranted by demand from alround but there will be very little hay for export from this section.

Toronto.

LIVE STOCK—Best heavy steers, $6.75; prime butchers', $6.25 to $6.40; good, $6 to $6.25; medium, $5.50 to $5.75; common, $5 to $5.25; inferior, $4.50 to $5; cows, $3 to $5.25; bulls, $4 to $5.35; calves, $4 to $8. Sheep, $4 to $5; lambs, $7.50 to $7.75. Hogs, $6.70 fed and watered, and $6.35 f. o. b. cars. Milkers and springers, $40 to $70.

Exporters.—Ninety-one steers, 1,190 lbs. each, average weight, at $6.50; 4 heifers, 1,150 lbs. each, at $6.50.

Butchers'.—The Swift Canadian Co. bought 18 steers, 1,328 lbs. each, the best load on the market, for local killing, at $6.90; and another load, bought for Montreal, at $6.80. Prime cattle, butchers' weights, sold at $6.25 to $6.40; loads of good, $6 to $6.25; medium $5.50 to $5.75; common to medium, $5 to $5.40; inferior, $4.50 to $5; cows, $3 to $5.25; bulls, $4.50 to $5.60; canners', $2.25 to $3.

Feeders.—Two loads of feeders, 800 to 850 lbs. each, were sold at $5 to $5.25 during the week.

Milkers and Springers.—The trade in milkers and springers during the week was not any too brisk, but good quality cows are worth good money at any time. Prices ranged all the way from $45 to $75 each, but very few got the latter figure.

Veal Calves.—Prices for veal calves of good quality have been firm for many months. Prices ranged for the past week, at $4 to $8 per cwt., with a precious few new-milk-fed quality at $9 per cwt.

Sheep and Lambs.—As a rule, good sheep and lambs have sold at higher prices. Ewes, $4.25 to $5; rams, $3 to $3.50; lambs, Canadian, $6 to $7.50; lambs, American, $7.40 to $7.75 per cwt.

Hogs.—The hog market was fairly firm all week, at following prices: Selects, fed and watered, sold at $6.75, and $6.40 to drovers at country points, for hogs f. o. b. cars, and $7 per cwt. was paid for several loads weighed off cars.

HAY.—Baled, in car lots, track, Toronto, No. 1, $16 to $16.50 per ton; No. 2, $14 to $15 per ton.

STRAW.—Baled, in car lots, track, Toronto, $8 to $9.

BRAN.—Manitoba, $23 per ton; shorts, $25; Ontario bran, $24 in bags; shorts, $26, car lots, track, Toronto.

BUTTER.—The butter market keeps gathering strength, and the day is not far distant when the common grades will sell at 40c. per lb. Creamery pounds, 37c. to 38c.; creamery solids, 37c.; separator dairy, 34c. to 35c.; store lots, 28c. to 30c.

EGGS.—Case lots of American eggs, for there are no others to be had, 40c.; new-laid, 45c.

CHEESE.—Market firm, at 16½c. for large, and 17c. for twins.

POTATOES.—Market firm; Ontarios, $1.70, and New Brunswick Delawares, $1.80 per bag, car lots, track, Toronto.

POULTRY.—Receipts continue to be liberal, at steady prices. Dressed—Turkeys, 18c. to 20c.; geese, 14c. to 15c.; ducks, 16c. to 18c.; chickens, 14c. to 15c.; hens, 11c. to 13c.

HIDES AND SKINS.—No. 1 inspected steers and cows, 11½c.; No. 2 inspected steers and cows, 10½c.; No. 3 inspected steers, cows and bulls, 9½c.; country hides, cured, 11c. to 11½c.; green, 10c. to 10½c.; calf skins, 12c. to 15c.; sheep skins, 85c. to $1.15 each; horse hides, No. 1, $3 to $3.25; horse hair, per lb., 33c. to 35c.; tallow, No. 1, per lb., 5½c. to 6½c.

FRUITS AND VEGETABLES.—Apples—Spies, per barrel, $2.50 to $4; Greenings, $2 to $3.50; Baldwins, $2 to $3.50; Russets, $2.50 to $3.50. Onions, Canadian, $2 to $2.25 per bag; parsnips, per bag, $1.35 to $1.50; turnips, per bag, 40c. to 50c.; carrots, per bag, $1.15 to $1.25; cabbage, per barrel, $2.50 to $2.75; beets, per bag, 75c. to $1.

Montreal.

LIVE STOCK.—In the local market prices showed an advance of ½c. per lb. in cattle, owing to the lighter offerings and the improved quality of the stock. There was also a better demand, butchers' stocks being rather light. There was some demand from Quebec for bulls, and some heavy stock was sold at 5½c. to 6c. per lb. Full loads of choice bulls sold at 6¾c. to 7c. per lb. Choicest steers sold at 7c. per lb., and prices ranged from 6¾c. to 7c., fine being 6¾c. to 6¾c. per lb., good sold at 6c. to 6¼c., medium at 5c. to 5¾c. per lb., and common dowr to 4c. per lb. Canners' sold as low as 2¾c. per lb., and up to 3¼c. and 3¾c. Milkers sold at $50 to $80 each, according to quality, and springers at $30 to $45. Small meats sold at about the same. Ewes were 4¼c. to 4¾c. per lb., while bucks and culls were 3¾c. to 4¼c. Lambs sold at 6¾c. to 7c. per lb. The market for hogs was about steady. Selects sold at 7¼c. to 7 1-3c. per lb., weighed off cars. Calves ranged from $3 to $12 each.

POULTRY.—Market held steady recently, owing to good demand and cold weather. Prices, 17c. to 19c. per lb. for choicest turkeys; 13c. to 16c. for best chickens, 8c. to 11c. per lb. for fowl, 13c. to 15c. for geese, and 14c. to 16c. for ducks.

POTATOES.—Receipts very light, and the market strong. Green mountains sold, in car lots, at $1.70 per 90 lbs., on track, and inferior grades at about $1.50. Bagged and delivered into store, the price was about 2.c. and 30c. more than the above, in small lots.

EGGS.—Prices have seemed to become firmer as time passes. The weather continued very cold until just lately, and stocks in store were very light, few being produced. Selected eggs, 37½c. to 40c. per dozen; No. 1 candled, 32½c. to 35c., which is about as high as has ever been known.

BUTTER.—Market continues very firm. Supplies light for the time of year, and the make is of small volume. Prices ranged around recent figures, being 33c. to 34c. per lb. for choicest creamery, and about a cent less for current receipts. Western dairy sold at 27c. to 28c. per lb., and rolls at 29c. to 30c. per lb.

GRAIN.—The market for oats has been very strong, and prices have advanced. No. 2 Canadian Western sold at 53½c. to 54c. per bushel; No. 1 feed oats, 52½c. to 53c.; No. 3 Canadian Western, 51½c. to 52c.; No. 2 local oats, 51c. to 51½c.; No. 3 local, 50c. to 50½c.; and No. 4, 49c. to 49½c. per bushel.

MILLFEED.—Bran sold at $24 per ton in bags, and shorts at $26; middlings, $28 per ton; pure grain mouille, $32 to $34, and mixed mouille, $28 to $30.

HAY.—The market for hay is steady, being $16 to $16.50 per ton for No. 1; $15 to $15.50 for No. 2 extra; $14 to $14.50 for No. 2 ordinary; $13 to $13.50 for No. 3 hay, and $10.50 to $11 for clover mixture.

Whilst there is a very strong feeling in all local hay markets of the country no particular change is noticeable in the situation. Supplies whilst light seem sufficient to meet the requirements of a local character. Export business is quiet owing to difficulty in obtaining ocean freight space, and there is still a lot of hay at both American and Canadian seaports awaiting shipment. Cables from Liverpool report the market from at 100 shillings c. 1. f. London cables report situation somewhat easier.

American hay markets show greatly increased receipts. Trade has been light, and large bales are accumulating. High grade stock is short, and for this the prices are holding steady. Hay shippers should take notice that all bills of lading for shipments to New York should have "Inspection allowed" marked on bill ol lading. Railroads terminating in greater New York reluse inspection of hay at all points other than 33rd street, New York; Long Dock, Jersey City, N. J.; and Brooklyn, N. Y.; Eastern District Terminal. Canadian shippers will be at a disadvantage with their shipments, if shipping to points in New York State other than mentioned as the railroads refuse to allow car doors to be opened unless the bill of lading is surrendered to them.

Millfeeds are down about a dollar on the prices quoted one week ago. Ontario bran at $24, and Montreal at $23, at Toronto. Ontario shorts are up $1, now being sold at $26 by the car lot. Montreal quotes no change in the condition of millfeed in general, prices being firmly maintained under a good demand and small offerings. A firm feeling prevails in the market for rolled oats and corn-meal, and active business is being done.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

"WILLOW FARM" FOR SALE.

"Willow Farm" is situated two miles from the centre of the town of Amherst, which is a growing manufacturing town of over nine thousand population, and one of the best markets in Canada. There is a good public school within forty rods of the house.

The farm consists of one hundred and twenty three acres, forty three acres of marsh and eighty of upland, sixty five of which are under circulation.

The upland is in a high state of cultivation as a large stock of cattle have always been kept on the place and for several years a short rotation has been followed. The soil varies some but is mostly a good loam quite free from stone and easily worked. The pastures are well watered by springs and brooks.

The house is 28x38 feet, two stories with ell 16x20 with good cellar, heated by furnace. Barn 50x80 feet with basement stable which will accomodate forty cattle and six horses, also root cellar holding two thousand bushels. Carriage and impliment shed 26x36 feet and other out buildings all in first-class repair.

The fencing is nearly all of woven wire and in good order,

A wood lot of 70 acres, three miles from the farm will be included in the sale.

A retail milk trade of about one hnndred and twenty quarts a day will be sold with the farm if desired.

This is one of the finest live stock and dairy farms in Cumberland County; a beautiful home and a splendid opportunity for the right man. Apply to

C. HOWARD BLACK, Owner,

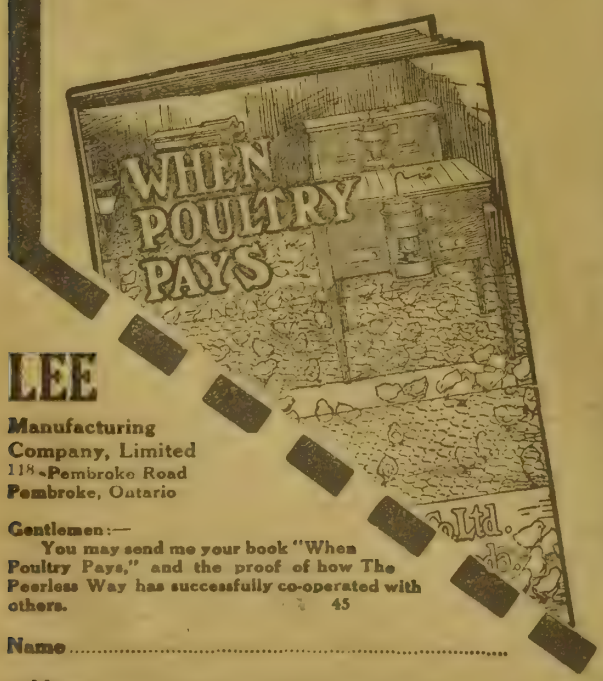
THE PEERLESS INCUBATOR AND THE PEERLESS WAY HAVE DOUBLED THE PROFITS OF 20,846 POULTRYMEN

ANY farmer can raise "poultry-for-profit" on the same plan and under the same conditions as we do it at the Poultry Yards of Canada, Limited, and make just as big a success as we have made of this, the largest and most profitable poultry farm in the Dominion. You can do it. You can put to work for you The Peerless Way and the Peerless Incubator and double or treble your profits right from your first month. Over 20,846 Canadian poultrymen have proven this. By following our system, they are making their poultry pay them greater profits than they ever dreamed were in the business.

THE book, "When Poultry Pays," tells what hundreds of followers of The Peerless Way have accomplished. It tells why the price of eggs doubled in seven years; it tells about a market that exceeds the supply by 200%—a market you can help supply at constantly rising prices; it tells about a plan that is more than merely a system of poultry raising—a plan that raises poultry **at a profit;** it tells about co-operative marketing—how the highest prices are secured in either large or small quantities; and, by no means least, it tells you exactly how to get started in this field of profits that lies right at your door.

Send For This Book—FREE For The Coupon



Remember, we will not send you this book unless you ask for it. "When Poultry Pays," illustrated throughout, has cost a good deal of money to produce and you will have to signify by asking that you are interested. Do not send for it with the idea that it offers any "get-rich-quick" plan, however; but if you have just a little money, a fair amount of horse-sense and a willingness to follow the advice of experts and look after your business, you can double your profits from the start. Indeed, if you will work just a little harder, you can treble them. If you want the book

We Will Show You How To Raise At A Profit.

THE Peerless Way, more than merely a system for raising poultry, will show you how to raise at a profit. Our Poultry Advisory Board sees to it that no followers of our methods ever fail. They give advice, counsel and detailed instructions in every step—from starting to marketing. Our 20,846 successful followers can testify to this—and many of them do so in our book.

We Will Show You How To Get Better Prices.

THIS alone is a valuable part of the service included in The Peerless Way. We guarantee to find, for all your poultry products, buyers who will pay you the highest spot-cash prices and who will charge you no commission for the service either. You do not need to be dependent upon the middleman and cold-storage buyer when you understand co-operative marketing. You do not need to give away part of your profits; the last few cents on every deal is your own "velvet"—and goes into your own bank-account.

We Will Show You The Best Way to Start

YOUR start is important; without experience or guidance, you can badly handicap yourself in the beginning. It may take years to overcome a bad start. The Peerless Way will put your first step on the right road to success, will show you the incubator and brooder that meets the climatic conditions of Canada's cold winters, and will furnish you with plans, blue-prints and complete specifications of poultry houses, etc., that are actually being successfully used today in Pembroke at the Poultry Yards of Canada, Limited.

You Can Learn At Home Or Come To Pembroke—As You Prefer.

THE Peerless Way, combined with the free, personal advice of our Poultry Advisory Board, will make poultry raising profitable for you. If you will take the Peerless Incubator and Brooder and just follow the plain, explicit directions of The Peerless Way, step by step, you cannot go astray. Or if you prefer it, you can come to Pembroke and, on payment of a small tuition fee, take a course of personal instruction at the Poultry Yards of Canada, Limited. But don't think you have to do that to make a success—for you don't.

Consult Our Poultry Advisory Board.

GET a Peerless Incubator and follow the instructions of our Poultry Advisory Board as outlined in The Peerless Way. Or, in special cases, consult them by mail free. You can't fail to increase your profits. If you are interested in greater profits from poultry, send for our book—NOW.

YOU WANT TO

Make Money

Dividend of 10% assured the first year

Five going concerns have decided to amalgamate for the purpose of not only making more money but so that they may expand and thus be in a better position to handle their increasing business in all Canada.

Each of these concerns are making good on the capital invested and it is estimated that under the proposed amalgamation that money will be saved both through the buying and selling ends and also that expenses will be cut in two, that it will be possible to earn dividends of 20 per cent in a short time.

During the next few years there will be millions of dollars spent in Canada and it is the object of these concerns to put themselves in a position to get a large share of this money. This could not be so easily accomplished if each were to operate separately.

Each of the five concerns are engaged in separate pursuits consequently no market condition can effect more than one at a time. Each are handling lines that are in daily use. The object is to have the stock of the company as widely distributed as possible. It can only be purchased in not less than $100.00 shares and not more than $1000 to one person.

We are not selling stock as a favor to the buyer, but because with additional capital the company can make money very fast.

The control of the company will be in the hands of incoming investors and the new capital is to provide for expansion.

Every Investor has an opportunity to assist in developing business and when 400 new families become customers there will be a further earning of 20 per cent. to investors.

We have no time to waste and our object of advertising in this way is to secure the names of parties that are desirious of a safe investment.

The company will be under the management of a man and a directorate that will bear the closest scrutiny. Everything will be made clear when we answer your communication.

If you have money that is not earning what it should please fill in the enclosed coupon and mail it today.

I have Money that I want to invest in a safe way and would be pleased to have you send further information.

This Does Not Bind Me in Anyway.

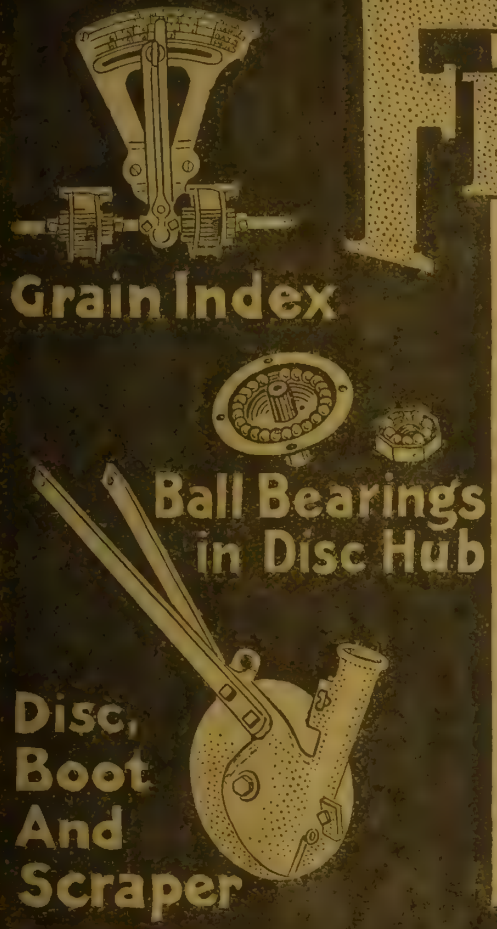
Sow Your Grain in Drills Get LARGER Crops More Profits

Sowing grain in the old style way is wasteful. While some spots get too little seed, most of the ground is generally too thickly seeded.

But sow your seed with the Champion Disc Drill and waste is eliminated. It sows with precision, just the right amount of seed in every inch of every furrow. The same amount of seed goes farther, produces larger crops and yields you more profits. The Champion way is the profitable way to sow your grain.



Frost & Wood

Champion Disc Drill

The Champion Disc Drill has made a great name for itself in "dirty" fields. Corn roots, tangled grasses and straw manure do not bother the Champion. It cuts right through the "meanest" field, sows the seed and covers it up.

The Champion is a wonderfully light draft machine. Instead of the usual iron to iron bearings at the hubs of the discs, the Champion has sets of dust-proof ball bearings. It's the only disc drill so equipped. This smooth-running, friction-reducing feature, together with no neck weight, make the Champion Disc Drill easier on horses than any other disc drill we know of.

The Champion Disc Drill is a strong substantial machine. It has a stationary axle to which the frame and grain boxes are solidly attached. It is built to give you many years of satisfactory service.

It is so built, too, that it is a pleasure to sow seed with it. There are no notches into which a shifting lever must be shoved. You can sow to a fraction of a pint by simply adjusting the Index. The Champion is thoroughly tested before it leaves the factory, and you are thus assured of getting perfect satisfaction when your Disc Drill bears the name "Champion."

We have a special Drill Catalog that we are waiting to send you directly we receive your name and address. Send us a card by next mail.

DE LAVAL
CREAM SEPARATORS

THEIR GREAT SIMPLICITY

De Laval Cream Separators excel other separators not only in thoroughness of separation. sanitary cleanliness, ease of running and durability—but as well in their great simplicity.

There is nothing about the operation, cleaning, adjustment or repair of a modern De Laval Cream Separator which requires expert knowledge or special tools.

Nor are there any parts of which adjustment is frequently necessary to maintain good running or to conform to varying conditions in the every-day use of a cream separator.

There is no need to fit and adjust parts to get them together right. They are so made that they cannot help go together right. All bearings and bushings are easy to replace. There are no complicated springs, keys, ball bearings or other fittings, that only an expert can properly adjust.

A person who has never touched a separator before can, if need be, unassemble a modern De Laval machine down to the last part within a few minutes and then re-assemble it again as quickly. This is something which cannot be done outside a shop with any other separator.

The only way to properly understand and appreciate De Laval superiority to other separators, is to look over, and better still to try, a 1912 De Laval machine. Every De Laval agent is glad to afford prospective buyers the opportunity to see and try a De Laval Separator.

Decorating Manes For Show or Sale.

Some Ideas Worth Practising for the Maritime Horse Show, April 3rd to 5th.

As the Maritime horse show draws near the following instructive article on the art of decorating the manes of draft horses for show or sale by Wayne Dinsmore, Secretary of the Percheron Society of America will be of interest to our horsemen.

The attractiveness of draft horses is greatly increased by the judicious use of decorations in form of roll plaits and small flowers. Draft horses are seldom sent into the showrings without such decorations, and at all the larger shows stallion grooms may be found at work long before daylight, preparing their charges for entrance to the lists.

For the Aberdeen plait colored yarn (Saxony at about 8 cents per skein preferred) is used. Two skeins should be secured, colors that will harmonize being chosen. Red and white, or cardinal and gold, or light blue and cream yellow, are very suitable combinations for dark manes. Each skein should be straightened out, cut once, and separated into two portions. Two skeins furnish sufficient yarn for two horses. Half of each skein is then taken with the ends matched together, side by side, and a bit of yarn is given three or four wraps around the two colors, then tied. This puts the ends in attractive shape. The yarn will be 4 or 4½ feet long.

The mane should be clean and well brushed out and combed to one side or the other. Small benches, 30 inches high and 6 feet long, are provided to stand on. Two men are needed—one to hold the horse, the other puts in the plait. The horse is held with head up, as he would show.

Stand on the bench up beside the horse's neck. Suppose the mane to be combed to the right. Stand on that side facing the same way the horse does. Begin about 2 inches back of the ears. From the top of the mane select a strand about as large as the forefinger. Separate it from the rest of the mane and hold it up. Place this strand of hair between the two strands of yarn and draw the yarn down until the knot rests firmly against the strand of hair. Draw the left (yellow) strand of yarn straight along the top of the mane. Toss the right hand strand (red) cross it, and let it hang down on the left side of the neck. Hold all in position with the left hand.

The Aberdeen Plait.

Next separate another strand of mane, about the size of the little finger, from the top of the mane, just opposite where the yarn strands cross. Draw this directly toward yourself over the yellow strand. Grip with the thumb and forefinger of the left hand. Next draw the original strand of mane back, crossing the other mane strand at right angles and lying over and parallel to the yellow strand of yarn. Draw all snugly so as to keep the plait close to the top of the mane. When all has been drawn tightly, the yellow strand is drawn toward the body of the operator, then crossed over the strand of mane which was parallel to and above the yellow yarn and allowed to drop over on the left side of the neck. The strands are held firmly with the left, and the right hand is passed over to secure the strand of red yarn which is drawn directly toward the operator, crossing the yellow. Draw it snugly and keep the left hand holding the plait close in toward the top of the mane. Now draw the strand of mane which lies to the left of the strands of yarn, to the right, causing it to cross the red strand which should lie parallel to the top of the neck. Hold it to the red strand firmly with left hand, reach over with right and gather up a small strand of mane and draw this in with the other, at the same time crowding the plait close in to the top of the neck. Hold firmly with the forefinger of the left hand below the red yarn, the thumb on top of the strand of mane which crosses it. Next draw the strand of mane which has been lying on the right, back toward the withers crossing the other strand of mane, and thereby coming parallel to and above the red. Place the thumb on top of this, next draw the red yarn slightly to the right, then throw over to the left over the strand of mane which lay parallel to it, and throw clear over the neck; then draw the yellow toward the operator, crossing the red yarn, and continue as before.

Special care must be exercised to keep the strands of mane of the same size, approximately, as the strands of yarn. Fresh mane should be taken in each time the mane strand is drawn in from the left, and the plait must be kept close in beside the top of the mane until well down toward the withers, when it should be gradually sloped down from the top, giving a graceful curve. Hairs must be kept out of the yarn as the beauty of the Aberdeen plait depends largely upon the skill with which it is put in. Artificial roses may be used on this plait, but this is seldom done.

Of all the devices resorted to by the skillful groom to increase the beauty of his charges, none gives greater attractiveness to the mane than the diamond roll. Great skill is needed in braiding this, and patience without limit is required in working with horses that are restless, if good results are looked for. Golf's braid, a kind of tape approximately ¾ of an inch wide and of firm weave, is used. It comes on small spools in 3-yard lengths. The colors found in dry goods stores are usually too dull to be used, but the desired colors can be secured by ordering the braid from large Chicago firms. Four colors are usually used and care should be taken to secure colors that harmonize, such as red (a dark cardinal shade), cream yellow, white and a dark shade of green. Four spools, one of each color, furnish sufficient tape for two manes, on horses of ordinary size—cost, 5 cents per spool.

The Diamond Roll.

After cutting the tape to the right lengths, 4½ or 5 feet, place the four colors side by side. For the purpose of giving directions we will assume the white to be on the left, followed by red and green, with yellow on the extreme right. The ends are drawn even and a single plain knot is turned in the tape, leaving the short ends about an inch long.

In addition to the tape, a filler is needed. Strips of cotton cloth or a small rope may be used, but the latter is unsatisfactory because it is hard and inelastic. The best material is raffia. This is the shredded inner bark of a species of palm tree, and is very tough and strong. It is much used in green-houses and can be secured from any firm that deals in horticultural supplies—cost 30 or 40 cents per pound. A pound will furnish enough for thirty or forty horses and it can be used over and over again. A sufficient number of the strings should be selected to make, when doubled, a strand about as large as one's little finger. The strings are usually 5 or 6 feet long. By slipping part of the strings one way and part the other, the little bundle of raffia can be made about 4 feet long (when doubled), tapering gradually to the end.

The mane cleaned and tape and raffia ready, the operator is ready. An assistant holds the horse, the bench is placed beside the animal and the operator stands on it, facing the front. The band of raffia is grasped at the center, when doubled and placed in the mane from 3 to 4 inches back of the ears. One strand of mane is selected and the raffia placed over it. Small strands of mane are drawn in with the two raffia strands and the operator braids a common three plait for about 2 inches. This is done merely to give a solid fastening for the roll on the forward part of

the neck. Having braided raffia and mane together for a couple of inches, the operator ties a knot, temporarily (to be untied whenever the roll reaches it), and is ready for the tape. Briefly stated, the diamond roll is a four plait braided around the center or filler of raffia and mane. Exact directions follow:

Place the tape astride of the three braid, with the short ends pointed up, white and red on the left, green and yellow on the right. Stand close to the horse, and keep the left hand which holds the braid, close to the top of the mane. Place the knot forward of the raffia. Draw the green tape, which is nearest the raffia on the right, toward the withers, holding it on top or slightly to the right side of the raffia center. Reach the forefinger of the right hand under the raffia, catch the red tape, which is nearest the raffia on the left, draw it under and then throw it over to the left side of the neck. This causes it to pass between the green and yellow, and over the raffia center and green tape. Draw this snugly to place and hold it firmly with the thumb and forefinger of the left hand.

Next push the yellow tape under the raffia between the white and red and then back toward the operator, over the raffia and red tape. Draw the red, green and yellow taut; the last two should now lie on the right side, with the yellow, nearer the withers than the green. Hold all firmly with the left hand, forefinger below, thumb above, and keep the hand close to the top of the mane.

Next pass the forefinger of the right hand between the yellow and green tapes; under the raffia, and grasp the white tape. Draw it under the raffia between the yellow and green and then pass it over the raffia, back to the left side of the mane, thus causing it to cross over the yellow tape at the same time. Next pass the green tape under the raffia and bring up between the red and white; then draw it over the raffia and white tape to the right side. The four colors have all been used when this last move is completed and each color appears in a little diamond-shaped piece, hence the name diamond roll.

Progress from this point is made in the same way that the first four moves were taken. Each color in its turn is drawn under the raffia center, between the two on the opposite side, thence back over the raffia to the side whence taken and crosses each time the same color as at first.

To keep the roll up on the mane, it is necessary to draw in enough hair to bind the roll to its place. This must be taken up in such a way that it does not become visible. This is best accomplished by selecting a small strand from the top of the mane and drawing it in underneath and parallel to the raffia, just before one of the colors (it matters not which) is drawn from the left-hand side. This strand of mane is held firmly against the raffia and the tape is then drawn beneath it and over in the usual way, binding the roll down to the top of the mane. By taking in a small amount of hair about every inch, which will be the case if it is taken in every time the one chosen color is drawn in from the left, the roll will be kept to size and will be so firmly attached to the mane that movements of the neck will not shake it free. It is unnecessary to wrap the mane strands around the raffia, for if each tape is drawn as tightly as it should be the roll will stay to place. The roll should be kept up on top of the mane till well down towards the withers. It should then be slanted off gradually, as in the Aberdeen plait, the exact slant depending upon the fulness and length of the mane.

...The foregoing directions should render it possible for anyone to do good work, but the horse must be held still, with the head up in show position, and the operator must do rapid, careful work, with particular care to avoid wrinkling the tapes, if a good roll is looked for. Not a hair should show on the outside of the roll, nor should any raffia be visible. Silk ribbon is sometimes used for this work, but it is expensive, and wrinkles too easily to be chosen if the regular tape can be secured. Skirt binding is too wide and too flimsy to be used.

Small artificial roses, which can be purchased at millinery stores at 40 to 50 cents per half-dozen, add greatly to the general attractiveness of the roll. These have cloth-covered wire stems about 6 inches long. About five medium sized roses are used and fastened down fairly close to the roll; the wire stems are twisted around the roll, and as they are covered with colored cloth, they are inconspicuous. This method of attaching is to be preferred to that of braiding them in with the roll, as it is easier accomplished, and if desired the roses can be removed when the horse is left in the stall over night. A roll or plait, well put in, should stay for several days, the plait much longer than the roll.—Wayne Dinsmore in Breeders' Gazette.

New Brunswick Immigration Congress.

The most important step taken in the Province of New Brunswick in the way of promoting the settlement of her wide expanses of vacant lands by her own sons and by an influx of settlers from beyond the seas was the Conference held in Fredericton on Friday, March 8th, 1912. The congress consisted of representative delegates from all parts of the province who deliberated in a purely nonpolitical gathering, actuated by common thoughts,—the best interests af the province and the best means of mapping out a campaign that will be successful in bringing about the desired results.

About a year ago representatives of the New Brunswick Press held a Conference for the purpose of discussing and forwarding an immigration policy. The St. John and Fredericton Boards of Trade, assisted by Boards of Trade from nearly every town in the Province were the instigators of the present Congress so that when the fiery cross was passed along for a meeting at Fredericton, the seed sown by the members of the press had germinated and the citizens of the whole province were ready to forward the delegates on their way.

John T. Jennings, President of the Fredericton Board of Trade, presided at the sessions. He called for enthusiasm in the work and asked the various delegates to do all in their power to keep the movement prominently before their people and not let the fiery cross drop after the meetings were over but keep passing it along with united efforts until the desired results were accomplished.

Mayor A. D. Thomas of Fredericton, referred to New Brunswick's neglected privileges. The world should know the greatness of our inheritance the prodigal should be invited to return and the dutiful should be encouraged to remain at home.

A gratifying feature of the deliberations at the congress was the stirring notes of optimism that prevaded the various addresses. Each and every delegate was ready to extol the advantages and natural resources of their respective portions of the province to such an extent that the people of the North Shore learned more of the opportunities offered on the South Shore and vice versa than they ever knew before.

"The need of Greater publicity for the Province of New Brunswick" was introduced and discussed by J. D. McKenna, Editor of the Kings Co. Record, Sussex. The first great essential to an advertising campaign was to have implicit confidence in the goods advertised. He enumerated some of the prominent industries and other advantages offered by New Brunswick that have caused a population of knockers to become boosters, who have every faith in their province and who are now ready to let the world know what they have to offer. The best way to accomplish the advertising of New Brunswick was to form a New Brunswick league, with branches in different parts of the province and small membership fee charged. The sum thus realized could be devoted to advertising. TheC. P. R. would help advertise the province. The Federal Government would assist, the Local Government would do its part but the greatest source of all advertising would be the people themselves.

T. W. Butler, Newcastle; T. H. Estabrooks, St. John; Mr. Armstrong, St. Andrews; James McQueen, Shediac; Matthew Lodge, Moncton; A. D. Holyoke, Woodstock; Wm. Currie, M.P.P., Restigouche; C. N. Vroom, St. Stephen and Medley G. Siddall, Port Elgin followed in the discussion. Some of the ideas brought out by these speakers were: Bring to the attention of the agricultural classes abroad the agricultural possibilities of New Brunswick. The mistake of taking every Tom, Dick and Harry from the slums of large cities and placing them on our farms. The advisability of helping to retain our native born population. Get the right class of men on the advertising committee. Have the outline of the British Isles placed on the map of New Brunswick to give intending settlers an idea of the vastness of our domains.

Mr. Holyoke of Woodstock intimated that members of the Woodstock Board of Trade had personally contributed a set amount for a publicity campaign.

Charlotte County Board of Trade was making a move in the line of advertising Charlotte County and already much good had resulted.

"The desirability of having excursions from Western Canadian points to the Maritime Provinces" was introduced by C. Fred Chestnut, Fredericton and seconded by T. C. L. Ketchum, Woodstock.

Mr. Chestnut pointed out that New Brunswick had great advantages to offer and the business men of the West should be put in touch with this province. He suggested as the best means of doing this the running of business men's excursions from western points to the East. There was no doubt if the people were only once started from the West to the East, the movement would be continued.

William Stitt of the C. P. R. endorsed the idea that if the population of New Brunswick is to be brought up the people must come from the New England States. The C. P. R. had been running excursions from the West to the East for 20 years and had fixed low rates. They had not met with all the success they had expected. In fifteen years 4,000 New Brunswickers had gone west whereas 15,000 had gone to the New England States. This then was the place from which to get the people back. The C. P. R. was prepared to co-operate with the people of New Brunswick for it was good business to do so. Every man placed on the land helped the C. P. R.

George Ham, of the C. P. R., was then called upon. He said the proper way to get immigrants was to go out and hustle for them. One did not catch fish around the town pump, or shoot moose in the back yard. It was the same with attracting immigration. Immigrants could not be attracted to New Brunswick by talking about it to the people who are already here. Mr. Ham said the C. P. R. was prepared to do anything it could for the provinre of New Brunswick. He advised that any campaign undertaken must be properly planned. The officials must be well paid and they would furnish value for the money. With a proper and well managed campaign and no scarcity of funds the prosperity must come.

J. M. Lyons, of the I. C. R., advised that in any publicity planning a reason should be given for the farms being vacant. It struck him that the class of immigrants should also be carefully selected.

J. A. Edwards, of the Grand Trunk Pacific, said his company was largely interested in this question of immigration. The Grand Trunk had played an important part in the upbuilding of Canada, and if fortune had smiled on it now it was only its due. There could be no great west in Canada without also a great east, and the great east was already here. In the Maritime Provinces there were approximately one million people, happy and contented, but he did not altogether approve of the name of Maritime Provinces. Rather he preferred to have it known as Eastern Canada. He felt sure that the East would prosper, and assured the convention that the Grand Trunk Pacific would assist in the development.

"What New Brunswick has to offer as a home for the Immigrant" was the subject of an excellent paper prepared and read by S. L. Peters, Queenstown, N. B. We will publish the paper in full in a future issue. Following the reading of the paper, Mr. Peters moved the resolution: "Resolved that it is in the interests of New Brunswick to give greater publicity as to what we have to offer intending immigrants."

Dr. T. Ives Byrne, mayor of Chatham, suggested that free homesteads would prove an effective means of attracting immigration and that the government should be memorialized for this as well as financial assistance for the settlers. He advocated throwing open the crown lands of New Brunswick to immigrants.

Donald Innes, of Tobique River, said he was one of the men who immigrated to this country 37 years ago. He had made a success of his farm and thought others could do the same. He thought great care should be shown in selecting agents. There was too much said about the abandoned farms and there should be some other name for them. The immigrant would naturally ask why the farm was abandoned and would of course figure it out that if the natives of New Brunswick could not make a success of farming here, how could a stranger be expected to do it? Also there should be care in selecting immigrants. London was no place to go to for farmers and every Tom, Dick and Harry should not be invited to come in.

H. H. Stuart of Newcastle said that while it was important to keep

our own people in the province it is also necessary to get immigrants. The diverse resources of the provinces should be widely advertised and the immigrants will come then. He believed they should be settled in groups to develop community spirit and thus lead a more happy and prosperous life. In order to attract immigrants, Mr. Stuart said, New Brunswick must have a nationalized telephone company, a parcel post system to meet the exorbitant charges of the express companies, more railways, and better and more roads.

James A. Telfer, an extensive breeder and exhibitor of pure-bred sheep, who has shown his sheep at nearly all the important fairs in Canada and the United States, and who has taken up sheep ranching at Markhamville, N. B., after investigating the possibilities on both sides of the boundary line both in the East and the West, had found that New Brunswick was better adapted for the carrying on of his industry than any other part of Canada or the United States. Sheep raising offered a profitable field of work to intending immigrants. By giving sheep the necessary care a profit of 100 per cent. could be made on the investment. He advised that the province strive to get farmers from England and Scotland who would know how to engage in sheep raising. Vacant farms with houses and barns in more or less dilapidated condition can very well be used for sheep and may be bought at reasonably low figures. He also believed that if an advertising campaign along this line were carried on in Ontario, his native province, many young men who are looking for something better than they now possess would be induced to come to New Brunswick.

O. W. Wetmore, of Clifton, gave some interesting information as to the growing of strawberries, in which he has achieved much success. There is an excellent market for New Brunswick berries in Montreal, and he thought that any one who located at a point, where good shipping facilities are afforded could make a success of strawberry farming in this province.

"The Need of a Central Bureau established by the Government where immigrants could apply for reliable information and assistance and providing officials whose duty it would be to visit new settlers offering them assistance and suggestions." In discussing his subject, H. B. Scott, President of the Meductic Board of Trade, who introduced this subject, said the year 1912 promised to be the greatest in history for immigration to Canada, Australia and South America. New Brunswick should prepare for this. The establishment of a central bureau where reliable information would be disseminated was a most important matter. This central bureau, he thought, should be at St. John.

C. N. Vroom seconded the resolution, which he thought was the most important introduced during the afternoon, because it gave effect to the things which had been talked about previously. Mr. Vroom said that two years ago, during one of the fruit shows in St. John, an Englishman had told him he intended locating in New Brunswick, but he had been discouraged because merchants in St. John had told him the West was the proper place to settle. The speaker had advised the visitor not to buy a farm at the present time but to go to work for some one for a year and in that time look around and see where he should buy. Similar information should be given to new settlers through the central bureau. He approveh of the idea of a central bureau in St. John, but thought it should be extended through the province. He described what work was being done in Charlotte County on lines similar to those to be handled by the central bureau.

"That there is need of recognizing the importance of a greater community of interest and encouraging a closer co-operation between the man on the farm and the man in the city" was ably discussed by His Lordship Bishop Richardson who has lived for a long time both in the East and in the West. Conditions in New Brunswick were superior to those of the West where we hear a lot about success but very little about failures. The Western man was a confirmed optimist—abroad he swore by the climate of the West but at home he swore at the same climate. The people of the East must settle down to do their boosting systematically and persistently. The co-operation of interests was essential as the success of one stimulated the other. New Brunswick was by nature intended for small farms intensively cultivated.

Contrasting wheat growing in the West with potato growing in the East he said one man in Western Canada could handle about 70 acres of wheat yielding an average of 20 bushels per acre which sold at a price that left a net profit of about $700. In New Brunswick one man could handle 20 acres of potatoes, yielding about 2000 barrels which when sold left a net profit of upwards of $1000. A wheat grower handling 50 acres in the West would almost starve while on a similar area in New Brunswick the farmer would do well.

There was an opening in New Brunswick for beef raising. Flour mills might be established here as well as in Montreal and Kenora and the by-products could be profitably used. Conservation, reforestation and individual responsibility re forest fires were necessary for the maintenance of our forest resources. The asset of a good name should be carefully guarded by commercial interests so that the term "Made in New Brunswick" would be a guarantee of quality that would stand the most careful scrutiny. Improve one part of the province and you build up the other. It will not do to build up in one section with a disregard to the rest of the province or sooner or later the attempt will have the mark of failure stamped upon it. In this respect the farmer and merchant must work together. Talking alone will not boost. We must not be misled by a hollering but seek for inspiration, aspiration, co-operation and emphasize your interest in these by perspiration. Extend the lure of New Brunswick but give no false illusions. Stick to the facts. Welcome the immigrant. One disgruntled immigrant could do more harm than all the good an immigration bureau could overcome. Overlook the mistakes of the immigrant and stand behind the policy that will make your province grow to be one of the greatest industrial and agricultural centres in Canada.

A Land Settlement Policy for New Brunswick was the subject of a carefully prepared paper by Dr. C. H. McIntyre, Boston, a former New Brunswicker. Mr. McIntyre's address will appear in a future issue of the Farmer. He outlined the need of an agricultural Loan Commission to assist agricultural development and showed how this matter is successfully operated in other countries.

At the conclusion of Mr. McIntyre's address J. D. Palmer moved the following resolution:

"That the condition of our agricultural pursuits in this province required the urgent attention of our provincial and federal governments and as a necessary means of regenerating our rural life and settling the people upon the land we heartily endorse a courageous policy of state advances or agricultural loans to farmers and other persons engaged in such pursuits. We further request the provincial government to take immediate steps to raise the necessary funds upon the credit of the province, either by arrangement with the Dominion government for the use of savings bank deposits or in such other manner as may be expedient.

"As a preliminary method of carrying out this project we recommend the creation of a land settlement commission to manage the business side of the operations, to acquire, improve and sell vacant farms to natives or immigrants and otherwise assist the better settlement of people upon the land until such time as a charter for an agricultural bank is obtained."

John B. Burchill thought it was unwise to pass such a resolution without more mature consideration.

James Porter of Andover, contended that the banks would not lend money on farm property. The Canadian banking system he said, was nothing more or less than a huge trust to control the circulating medium on which the whole future of the country rests. He thought the government should provide money for the purchase of farms and should also nationalize the telephone. He was in favor of the tesolution.

R. E. Armstrong of St. Andrews moved an amendment that the matter be referred to the Boards of Trade throughout the province and to the Union of Municipal Councils.

Mr. Armstrong's motion was voted down and the original motion carried by a vote of 56 to 16.

The chairman announced the following committee to present the memorial to the provincial government, M. E. Agar, T. H. Estabrooks, H. C. Schofield, St. John; E. W. Ward, St. Stephen; T. C. L. Ketchum, Woodstock; R. E. Armstrong, St. Andrews; J. D. Harquail, Campbellton; J. B. O'Connor, Fredericton; M. G. Siddall, Port Elgin.

Arthur Hawkes, Canadian Immigration Commission, said that the convention was as far as he knew the first of the kind ever held in Canada. The resolution which had been adopted marked a great step in advance of anything the provinces had yet done. He pointed out that the first thing to be considered was what to do with your immigrant after you had got him and in this connection urged that he should be used right and honestly.

He had heard Dr. Geo. H. Parkin, a distinguished New Brunswicker, say that the New Brunswick farmer was the most proficient man on earth in the gentle art of skinning an immigrant. If New Brunswick could capture in the next five years 5,000 clean living English immigrants, they could form a partnership with them that would make New Brunswick even greater than prophesied.

Premier Flemming congratulated the province on the [illegible] convention of the kind ever held. During the last few months he had received a new vision of immigration. The Old Land can throw off 400,000 people a year and formerly four-fifths of these went to make new homes in countries where they lived under a foreign flag. More recently, however, this has changed, and now four-fifths of them go to other parts of the Empire. This being so, it was very important that those who come from England should come to Canada. New Brunswick parents should talk to their boys about their future profession. He advised that the young people should be kept on the land and their thoughts turned more toward the beauty of the country.

He was pleased that there had been a great revival of interest in this matter and that the boards of trade were prepared to put up their own funds with the government funds to aid in the work of development. He had been told that 40 business men in Fredericton had agreed to put up $25 each as a publicity fund. This was a good example.

Mr. Porter—I hope the government will follow it.

Mr. Flemming—I can't say a word politically on this occasion, but I can tell my friend, Mr. Porter, that the government is prepared to do its full duty in the way of bringing immigrants to the province and caring for them when we get them here.

We want to induce useful Sons of England, Scotland and Ireland as well as our native born boys to settle on New Brunswick soil. He hoped for the development of the province along the lines that it could absorb the increase as it came.

C. Lionel Hanington, of Dorchester moved, seconded by A. F. Barnstead, of Halifax, a vote of thanks to those who had assisted in making the convention a success after which the delegates dispersed to spread the optimism and good work to the remote parts of the province.

Island Jerseys for Canada.

About 120 head of pure bred Jersey Cattle are leaving Jersey this week for the Stock Farm of B. H. Bull & Son, Brampton, Ont. This is the largest individual shipment of high class stock ever made from the Channel Isles to Canada and the herd contains many animals with honors won in butter and dairy competitions and in the show ring.

"His Reverence," the celebrated Jersey bull with the distinction of having been for two years grand champion of the Island of Jersey, is one of the animals included in the shipment.

Are Your Horses troubled with Sore Shoulders?

The cause in all probability is from ill fitting collars. You can avoid it by using Currie's High Grade Horse Collars. They are made to fit the horse perfectly and have a good hair facing and will not sore your horse even when doing the heaviest kind of work.

Ask your dealer for the Currie Collar and if he has not got them in stock write, wire, call or phone to

R. J. CURRIE, 100 Brussell St., St. John, N. B.

Specialist in the manufacture of Horse Collars.

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

EDITORIAL NOTES.

Man's best possession is a sympathetic wife.

* * *

Diversified farming and intensive thinking go hand in hand.

* * *

It takes a very little bit of old cream to spoil a whole batch of butter.

* * *

Avoid tapping your horse continally with the whip unless you want to drive a common old plug.

* * *

How much is it worth to you, brother farmer to be your own boss? Did you ever set it down among your assets? Think about it whenever you become a little discouraged over your prospects.

* * *

Long neglect of the business side of farming is the great fault which is responsible for the fact that the consumer has to pay in the proportion of $13.00 for agricultural products for which the farmer only gets $9.00.

* * *

When the man who is progressive enough to test his cows is surprised at the result what do you imagin would be the result if the indifferent dairyman were to begin testing?

WORTH OF THE FANNING MILL.

The fanning mill should be one of the indispensable requirements on every farm. One cannot imagine anyone being so reckless as to sow his seed without first cleaning it. Good clean seeed is one of the prime requisites to good crops.

How often do you see weeds grow in profusion where invariably wheat, oats or corn should be growing. Every weed seed sown likely will grow and crowd out good seed, tending to lessen the yield of a good crop. It may be considered a small matter, or the croaking about nothing, but remembering how weeds tend to propagate, coming up year after year of themselves where the farmer's grain crops must be sown annually, it may necessarily have to be considered as a hugely important matter, or at least turn out to be in the end.

The putting of the seed through the fanning mill will not only clean out the weed seeds but also the undesirable unprolific small grain seeds, leaving the remaining seed, the seed you intend to sow, clean, uniform in size and the best in quality. This done year after year with painstaking care must certainly reward the farmer for time and labor spent with better and better, if not the best of crops. The importance of clean, uniform seed as an influence to better crops cannot be gainsaid.

For many years the oat crop has been the most neglected, the most carelessly handled of any crop sown or planted. The seed was promiscuously scattered baoadcast over land that had been in no way half prepared to receive it; taken right from the bin where it had been deposited directly from the thresher the previous fall, dirt, weed seeds, small, half formed grain and all sown under such circumstances in such negligent conditions, can a perfect crop, or even a half crop be expected from your fields?

We have seen seed oats put through the fanning mill prior to sowing and have cleaned from them, say from 20 bushels of oats cleaned, a bushel and over of dirt, containing millions of the most noxious weed seeds. Does it pay?

Ask the successful farmer with the big yield "what forms the foundation of a good crop," and he will answer you, second to none in importance is good clean seed." Soil conditions may be perfect, but if you have not the prime seed to deposit in the soil your labors may be counted vain.

There is no grain seed sown or planted on the farm but what it would benefit the farmer to put through the fanning mill for clean, uniform, best in quality seed.

If this important work has not already been attended to, it is more than probable that you have fed out some excellent seed grain. It is not too late to thoroughly fan the remainder and get the best of it for seed.

WHAT ABOUT OUR DUTIFUL SONS AND DAUGHTERS.

We hear a great deal now-a-days about movement whose object is to induce immigrants from foreign shores to settle on the abandoned farms of the Matitime Provinces. Another movements is fostered by the St. John Board of Trade to have what is called a "Back to New Brunswick" week during the summer of 1912. The aim of the "Back to New Brunswick" week is to get as many of the boys and girls, men and women who were born in New Brunswick, to come back and visit the old home land, when the wonderful natural resources of their native province will be forcibly brought to their notice, and perchance some of the wanderers may decide to remain and help to develop these resources. Our farmers and all concerned are heart and hand in accordance with these movements. The boy or girl who has remained at home and performed their dutiful obligations to home and country are worth more to New Brunswick than a ship load of immigrants or a score of the young men and women who are making their home in foreign lands. Many of the young men and women who have left us in the past are successful in the lands of their adoption; they are an honor to themselves and to the country that gave them birth. We are proud of them; but we are prouder still of the industrious young men and women who are making a success at home. Are we doing our best by our dutiful sons and daughters? We would like for each and every father who reads the Maritime Farmer to read the article "Which shall it be Stranger, Prodigal or Dutiful Son" that appears on the pages of this issue. Having read it, ponder over it and put the implied questions fairly and squarely to yourself: the happiness and future prosperity of your home may depend on your reply.

INDIVIDUALITY IN FARMING.

There is too much imitation in agricultural practices. Thousands of men are unthinking followers where there is one steadfast, unswerving leader. A farmer's vocation does not compel this sort of blind trailing after the crowd. He is not in an army under a general. He is himself a general, with the opportunity and the incentive to plan and work out his own campaigns. If he is wise he will take much counsel, observe closely and rely finally on his own judgment. Even if that prove costly, as occasionly it surely will, it is better for him; he will know his lesson, and grow in the self developed power to deal with his own problems.

If action in a given case followed the careful, deliberate thought of a community of farmers, then the individual who dissented and went a contrary way would be unwise and almost inevitably unsuccessful. But the vast majority of people do not think; they act, and think afterwards. Since folk of this type are easily swayed by economic and political conditions they do not understand, they invariably rush this way or that in unreasoning, inarticulate masses, sacrificing property and losing their way toward any clear course of effective action.

Agriculture as a business needs more men who have the brains, the will and the courage to act with unshakable personal independence, calm and resolute when the multitude is stampeding, and pursuing the course which they have reached by thought. Such men do not imitate or copy; they do not follow in blind faith. They think and act as free individuals, basing their acts and attitudes upon a careful study of the facts, so far ot they can ascertain them.

ARE YOUR SEEDS ALL RIGHT?

Now is an excellent time for buying seeds for spring sowing. Have you sent to the various seed houses that advertise in the Maritime Farmer for their catalogues and price lists? It is important that all seeds should be tested on arrival, and this refers not only to grain, but also to grasses and clovers. The success or failure of your efforts for better crops in 1912, no matter how much attention you may give to cultivation and fertilization, will hinge on whether you sow or plant seeds that have an abundance of vitality. In purchasing seeds be sure to get the best. Cheap seeds of low vitality are expensive and disappointing at any price.

Recommendations by the Canadian Sheep Commission.

In now concluding our report, we will not dwell upon the advantages which would accrue to Canadian farmers through the creation and establishment of a great sheep industry in the Dominion. These we hope will be apparent. We are under obligation however, to set forth, if only in a general way, the outlines of a policy which we would recommend for adoption in the interests of this important work. It will have been observed that all through the report much emphasis has been placed upon the necessity of an educational campaign being undertaken, in districts where there is little intuitive knowledge of sheep keeping, and upon the need of a more thorough organization in connection with the production and marketing of wool. In order, therefore, to give effect to the proposals which may receive the endorsation of the Department and in order to gibe permanence to the policy which may ultimately be adopted, we would recommend the appointment to the Live Stock Commissioner's staff of two specially qualified officers to represent, respectively, the sheep and wool industries, as a part of the executive organization of the Live Stock Branch. The sheep industry, with all its attendant features, is in need of definite organization and systematic direction, and, in order to effectively serve the interests involved, we think the Minister might wisely consider this means of initiating the work.

Following the adoption of this proposal, an extensive campaign of education should be commenced. This campaign should cover every phase of the production and marketing of mutton and wool. The more important features which our investigation leads us to emphasize as deserving of special consideration, we may now proceed to give in detail.

1. The general adoption of improved methods in breeding sheep is of primary importance. The haphazard system now in vogue has done incalculable harm in retarding progress from the standpoint of both the wool and mutton markets. The undertaking of a business-like policy, pre-supposing close attention to the requirements of the trade will alone save the situation. Scientific breeding must be understood and its principles practised. The maintaining of a single breed in any one locality is worth encouraging.

2. Farm management, in relation to sheep husbandry, is almost a science in itself and the subject should receive full duscussion. The management of land, from the standpoint of sheep keeping, is practised by only a very few breeders. Definite systems should be advocated. The advantages of special pasture crops should be pointed out and the danger arising from infested pastures made clear.

3. Sheep are, as a rule, poorly housed and poorly fed. Severe losses are sustained through lack of proper care during the winter season. Information regarding the successful feeding and management of a flock is badly needed. Dipping, docking and castration must be intelligently undertaken by the breeders.

4. The demands of the meat market are insistent but are disregarded. Age, size and quality are factors of importance. Farmers should be urged to form the habit of regularly informing themselves as to the trend of the trade in the purchase and sale of mutton and lamb. The present irregularities and anomalies, both of supply and demand, are due largely to lack of foresight on the part of the breeder and feeder.

5. Definite information is needed as to the requirements of the best markets for wool. This, when provided, should include a full explanation regarding the care of the fleece on the sheep's back, on the shearing floor and up to the time it leaves the farm.

6. Wool exhibits should, we think, be provided at a number of the more important exhibitions of the country. Such exhibits elsewhere have proved to be an excellent means of enlightening farmers on all matters connected with wool production and market requirements. So far as possible, the exhibits should be in charge of demonstrators fully qualified to give to wool growers needed information upon these and related subjects.

7. The educational facilities offered by the Agrirultural Colleges in the Dominion are such as to make it desirable that advantage be taken of them to create amongst the students a special interest in the trade in wool. We would suggest that the Department provide these colleges with carefully arranged wool displays. We would urge also that their co-operation be secured and that they be earnestly requested to include in their courses on sheep husbandry a set of lectures on the structure of the wool fibre and an the scientific production of wool.

8. Demonstration farms should be established in various parts of the Dominion. Each farm should furnish a practical example of the advantages to be derived from the keeping of sheep under the conditions obtaining in the particular district in which it is located. The purchase of land would in few cases be necessary, rented farms being quite as suitable for the proposed undertaking. The sheep industry is in need of practical object lessons and nothing less will serve. The Live Stock Commissioner's expectation that these farms would be self-supporting is a strong argument in their favor and should further commend their practical value to the sheepmen of every province. The farms should be so situated as to effectively illustrate the advantages of sheep keeping, as for example,—in profitably utilizing rough land, in fostering a more intensive practice on mixed farms, in assisting to clear Western lands of weeds and in bringing into more productive use the rich valleys of British Columbia, where an early lamb trade is awaiting development.

9. The further distribution, in isolated districts, of pure bred sheep, especially rams, should be undertaken in a comprehensive way. Canadian breeders have neglected the home trade and suitable breeding stock needs to be wisely directed into channels where it will more effectively serve the interests of our own farmers.

10. Co-operative summer grazing should be encouraged, especially, in the Eastern provinces, as previously suggested in our report.

11. Co-operative marketing of sheep and lambs should be organized in specially selected districts in order to ascertain the feasibility of the more general adoption of such a system. Our investigation leads us to strongly favor this method of marketing.

12. The settlement of abandoned farms where sheep raising could be made a specialty should be encouraged. In order to render this practicable, it would be necessary that the land be cleared of stones, underbrush and much useless timber. Temporary loans to the farmers, to be paid back in annual installments extending over a period of years, would enable them to effect the necessary improvements. We commend to the provinces the consideration of the whole question. Lacking their initiative in opening up these abandoned areas for settlement, much useful land will, in all probability, continue to lie idle.

13. Realizing that the enactment of dog legislation may be undertaken solely by the Provincial Governments, we would suggest that the Minister represent to these Governments the necessity for the rigorous enforcement of the existing dog laws or for their amendment, if such be required. Suppression of the evils attendant upon the attacks by dogs would remove the greatest obstacle to successful sheep raising and restore a sense of security and confidence to this important industry. After careful study, we have come to the conclusion that a regular tax should be imposed upon the owners of dogs, the annual payment of which would place needed restriction upon the maintenance of useless animals and at the same time provide sufficient funds to fully compensate farmers for such losses as they might incur through the worrying of their sheep. As proof that the tax has been paid and as a convenient means of identification, all dogs should be required to wear a collar, with a small metal disc attached, which should bear on the one side the owner's name and address and on the other the license number.

In those provinces where sheep suffer through the attacks of coyotes and other harmful wild animals, we would recommend that the enactments providing for the suppression of these pests be systematically enforced.

14. Special assistance should be afforded to Sheep Breeders' Associations to enable them to forward experimental consignments of wool to British markets in order to test the advantages to be gained through such shipments. Careful arrangements should be made to ensure having the wool in the best possible condition, not only in the case of such as may be selected for experimental shipments, but in regard to all consignments intended for sale in Great Britain.

15. After carefully studying the various methods of handling wool in successful sheep farming countries elsewhere, we have come to the conclusion that Canadian wool should be handled on co-operative lines, so as to combine the advantages possessed by the marketing system of Great Britain with those secured through the organization of Australasia, together with such as would likely be obtained through the adoption of approved methods recently undertaken in other countries. As a means to this end, central wool depots or receiving stations should be established in suitable localities for collecting, warehousing, grading and classing, Canadian grown wool for shipment to the home or to the export trade.

Which Shall it be Prodigal, Stranger or the Dutiful Son,

Editor Maritime Farmer:—

"Back to the farm," that expression of recent birth and rapid growth has provided me with a subject of thought for some time.

Before commending or condemning it I would like to know the meaning the writers under this heading mean to convey. If they mean a general rush of everybody, regardless of their adaptation and qualifications for the land, then I condemn it; but if the intention is, to induce only those who have a love for agriculture and who possess the necessary natural ability, education and other means essential to success, then, I commend it.

As no qualification has appeared under this heading, I am almost inclined to think that its birth and growth came about much the same as the expressions:—"Sure"! and "That's right"! which have spread as rapidly as the Divil's Paint Brush in an old run-out sod field.

I first saw this "Back to the farm" heading in the Farm Journal. A man in New York gave a detailed account of his success on five acres of land in Vermont. This man was born in that State, lived his early days on the farm, acquired a love for the soil, but, growing tired of the monotonous life, as the farmers lived it, went to New York and acquired a good knowledge of strictly business principles, and devoted his spare time to studying scientific agriculture. He never lost his first love. Failing health caused him to return to the farm, and with all the necessary qualifications referred to above, he and his wife, to whom he was careful to give her just share of the credit, made a satisfactory success and he regaining his health.

Shortly after I saw another letter in another American paper under the same heading, not so interesting. As I saw it was by a mere copyist. I like originality of thought. Soon after, it got over into Canada. I suppose it was on the free list.

I do not mean to discourage any one who may desire to take up farm life, for that is the natural and ideal home of man, and there, as no where else does man meet and become acquainted with God in the study of His laws in plant and animal life. This cry "Back to the farm" is to the prodigal, no doubt, but, what about the elder brother? Which of these two men, think you, would be most likely to succeed on the farm? I have heard a great many sermons and pretty stories told about the prodigal; but, I have yet to hear the first defence for the elder brother. This text is always dealt with from a spiritual standpoint; but, I think it has its human side and a very strong one as well, and this is the side to which I wish to draw your attention. It is no wonder the old brother got his back up when he came home from his hard day's work and found his fatted calf gone, etc., etc. You all know the story.

The point I want to make is in defence of the boy, who sticks to the farm under hard circumstances and is to-day sliding down hill because of an exhausted farm, that is perchance in the hands of all kinds of money fiends and mortgages, paying all the way from 50 per cent. to 150 per cent. No man can exist under such circumstances—and to add to his sorrows, he hears a great noise and frolic over the prodigal and the importation of Europeans—and he has to bear his share of the expense.

Now, I say, take care of the boys we have already on the land, stranded for both education and capital. Give them a chance to share the possibilities of our province, and then we will have no difficulty in getting immigrants at their own expense. I do not believe we can import any better men aod women than have grown on our own soil.

The Seed Growers' Association, tell us that all the noxious weeds, with one exception, comes from Europe. Let us be careful in the selection of our immigrants. Let us profit by the experiment of the United States.

I think I understand the needs of this part of our province as not many do, for I have made a special house to house study of it for twenty years, and in this way have found out many things, which were not obtainable in any other way. It is in the back districts generally where I find the greatest need of help. The promised revival train will no doubt do a great deal of good to a certain class and number; but, I am afraid, with the masses the influence will subside with the last sound of the whistle (as is generally the case with humanly devised revivals when the preacher has gone), unless it is accompanied or preceeded by local demonstration. MIXED farms conducted according to local needs.

I sincerely hope that some system of borrowing money at a low rate of interest by the farmers will soon be introduced; education alone will not do. Unless this is accomplished soon, many of the farms will fall into the

(Continued on page 397).

HORTICULTURE.

Mushroom Culture.

To a great many people the art of growing mushrooms is quite a mystery, and even amongst gardeners of considerable experience and skill their cultivation is attended with a good deal of guess work, because they lack the knowledge of two or three essential points, which, if attended to at the outset, the after crop of this delicious esculent can be looked forward to with absolute certainty. Everyone likes mushrooms, and there is no reason why anyone who can procure the manure and has a place, either in a shed or out-building or a cellar, may not have a bed producing plenty of mushrooms the year around, excepting June or July—and even in these hot months they can be grown if kept covered up from the flies.

Mushrooms will grow anywhere when given the proper materials, and dark, dry cellars not being used for anything else are ideal places, spaces under verandahs, or the prepared manure may be packed in boxes any size, so long as they are deep enough to hold eight or nine inches of manure. Old bureau drawers serve capitally for this purpose—in fact, there is no limit to their cultivation in places that may be convenient or that ingenuity can suggest.

To have certain success, procure if possible the daily manure and sweepings from a stable, whatever quantities possible, forking out the long straw, if any, and add a third of good garden soil to the manure, mixing it thoroughly, turning daily to prevent it heating too much, adding to the pile fresh manure and soil as you procure them till you have sufficient to make a bed four or five feet in width as long as you have space for, and when packed down to be not less than eight inches in depth.

After the first rank heat has escaped, make the bed by placing the manure in layers, pounding it firmly. Pound it as you would pound the soil in setting posts; the more compact your bed is, the longer it retains the heat, and the spawn travels quicker through it.

In locating your bed, do not put it on a cold floor or where any water would be apt to raise and be absorbed by the bed; in such a possibility, raise your bed up four or five inches, and if made against a damp, cold wall, run some boards between.

When your bed is made put a thermometer in it and observe the temperature, which will rise up to a greater or lesser degree; but when you notice it going down and about ninety degrees, place your spawn in it by making holes four inches deep, fifteen inches apart, and place the broken spawn in small pieces in the holes, covering the same.

A particular point in after-success is to wait after spawning for a week or ten days before you put the top covering of soil. Many growers are so impatient that they put the soil on too soon. The heating or fermentation going on in the new bed causes moisture or hot steam, and this must be allowed to escape, so that if the soil was put on before this occurred it would be retained in the bed and kill the spawn. This is the actual cause for the failure in nine out of ten cases of attempts to grow mushrooms, and too much stress cannot be laid on these two points in growing them: The first, being careful not to spawn the bed till the heat is receding and is about ninety degrees or eighty-five degrees, and the second, not to cover with the top two inches of soil till eight or nine days have passed after spawning. When putting on the top two inches of soil, pat it down firmly and smoothly and then place a layer of straw over your bed; though not actually necessary, it aids to keep the soil surface moist and prevents the air drying up the bed too quickly, and keeps a still temperature. The temperature to grow mushrooms should be fifty-eight and one-half degrees, and should not vary, but anywhere between fifty to sixty degrees will answer. I have succeeded in varying temperatures, but that is the proper—fifty-eight and one-half degrees—and that is why underground tunnels, sewers or caves are utilized, because the temperature can be kept so even.

Following out the foregoing instructions, you should have plenty of mushrooms. Be careful not to get the manure wet when preparing it, as this delays and hinders your bed; in fact, it is absolutely necessary to save it and prepare in some dry place. There is sufficient moisture in the manure itself during the process of heating, but if conditions occur in too dry a place and your bed needs water, warm it well before applying, say about 100 degrees, an occasional sprinkling will keep it right. When preparing material for your bed, be careful to see there is no old iron, such as pieces of hoop iron, or nails. It is stated as a curious fact that iron will prevent any mushrooms. It is recorded that among rival mushroom growers in France care is taken of the beds to prevent any enemy from sticking nails into it, as this meant failure.

In about six weeks or two months, if the temperature keeps right, mushrooms should appear, and when gathering give the mushroom a slight twist so as not to disturb the little ones, and be careful to fill up with good soil any holes made in the bed by removing. Never cut them off with a knife, as the stump remaining will decay and infect the surrounding growth.

After a bed has exhausted itself, which it should in about three weeks, a couple of inches of good soil applied on the topwill renew the crop for a short while. I have found it efficacious to occasionally water it with liquid manure, which stimulates and increases the size of the mushrooms. When completely exhausted, remove the old material, which is just right for digging in flower beds or for bulb cultivation.

A good plan to have successive crops of mushrooms is to keep adding to your bed fresh manure treated as directed, removing the old portion as it throws off the crop. Mushrooms can be grown anywhere on shelves built for them in the cellar, making one above another, or you can have a bed in a barrel by filling the barrel, spawning it—having regard to the temperature—and then cutting holes in the sides of the barrel at various places, through which openings the mushrooms will appear. To sum up, the whole art of mushroom cultivation lies in observing these rules:

1. Get your manure fresh and keep from wet.
2. Turn daily and mix a third of good soil with it.
3. Make your bed, when pounded thoroughly firm, to be about eight inches in depth; any deeper would make it heat too much, and any thinner or shallower would not be enough.
4. Spawn it when the heat is receding from ninety degrees to eighty-five degrees, never more, as the heat would kill the spawn.
5. Wait ten days after bed is spawned before you put on top layer of soil, so as to allow excess heat and moisture to escape.
6. Do not water unless you have to and have it at blood heat.
7. Have the temperature near sixty degrees, no more.

As it takes six weeks to two months for the crop to grow, you can make the beds any time, so long as you avoid it cropping when flies

Cheap Tea is Dear Tea

SO declared the mother of a small family not long ago—

—And proved the statement true by simply relating her tea experience.

"I used a 30c. Tea for years," she said. "One day the Grocer asked me to try a 40c. package of **Red Rose**—he told me it was better Tea. I found it better Tea, and—before I had quite finished the first package I thought it made more Tea. The second pound I used with care—

—**And found out that less Tea in the Pot made a richer, finer-flavored Tea, if you know what I mean.**"

We know exactly what this lady meant—

—40c. **Red Rose Tea** is a richer, stronger Tea, more delicately flavored.

The 30c. variety makes about 150 cups—

—Whereas the 40c. **Red Rose Tea** makes about 200 cups.

So—You might as well have **better tea for the same cost in the long run.**

There are several grades of **Red Rose Tea** selling at different prices, but the 40c. grade seems to please best. It is not only fine Quality but goes farther.

"Red Rose Tea is Good Tea"

FREE—MAGNIFICENT PHONOGRAPH—FREE

Here is the most stupendous offer ever made by any reliable firm. We will give away absolutely without one cent of cost, 1,000 of these magnificent Phonographs, or Talking Machines, complete with your choice out of hundreds of the newest and most popular records.

This is the chance of a lifetime **An absolutely honest offer**

These grand phonographs are not toys, but genuine talking machines, manufactured and guaranteed by one of the largest European makers of high grade Phonographs. It talks, sings, plays orchestra, instrumental, or band music, tells funny stories, and, in fact, **can do everything you would expect of a $50 machine** It uses a regular cylinder record, of which we send you a large list to choose from. It winds up and is run by a regular clockwork motor, has a special governor to regulate and control speed, nickel plated sound producer fitted with perpetual needle. It is so entirely simple and easy to operate that any child could run it. It is full size, newest Lyra shape, beautifully enamelled and finished throughout, and fitted with a bright metal horn. You can put music, entertainment, and constant pleasure for everybody into your home, and you don't need to throw away your money by paying $25.00 to $50.00 for a talking machine, because you can get this one absolutely **FREE** for only a few minutes easy work.

Now all we ask you to do is to just send us your name and address, and let us send you, postage paid, and without one cent in advance, only 8 boxes of the famous Dr Edson's Life Building Blood Tonic and Nerve Pills to distribute among your friends at our special introduction offer of only 25c. a box. They are the greatest remedy on earth for weak and impure conditions of the blood nervousness, dyspepsia, stomach and kidney trouble, and a great Tonic and Life Builder. With them we will send you only 8 boxes of Dr Edson's Harmless Headache Tablets and 3 boxes of Edson's Little Wonder Stomach and Liver Pills, making a total of only 14 boxes in all, and you will sell them all in a few minutes because every purchaser of a trial box of these famous remedies can receive free from us, a grand present of fine silverware or gold finished cuff links or ring. When you have sold the 14 boxes, return us the money, only $3.50, and this grand phonograph and one record of your choice, together with an opportunity to get dozens of new records free, will be forwarded to you at once.

REMEMBER. We are bound to secure a national distribution for these grand remedies, no matter how much it costs us, and when we say we will give you this grand phonograph complete for selling only 14 boxes at 25c., we will do so. Do not miss this wonderful opportunity, but write to day to

abound. I would not advise making any beds in May. It is not necessary to grow mushrooms in dark places, but they will grow there as well as in the light.—J. McPherson Ross, Toronto.

Lime Sulphur is a Superior Spray to Bordeaux.

Prof. Cordely, of Corvallis Station, Oregon, said last year in Hood River Better Fruit:— "I have not only used and recommended the use of Lime-Sulphur for the past 3 years, but will use it and continue to use it until something better is found."

Prof. A. L. Melander, of Pullman Station, Washington, said last year: "I believe you will find Lime-Sulphur a better fungicide than Bordeaux." Writing again this year, says: "Lime-Sulphur has been proven to be a better fungicide than Bordeaux, and an all round spray in the west for keeping orchards clean and healthy."

Mr. Robt. Thomson, of St. Catherine, says he is greatly in favor of Lime and Sulphur, being satisfied that it will replace the Bordeaux as being more satisfactory, more economical and more uniform in quality.

Mr. L. Caesar, B.L.A., of the Department of Biology, Ontario Agricultural College, gave as his opinion "that there was no doubt that dilute lime-sulphur, either commercial or home-boiled, or Bordeaux, will give equally good results as a summer wash. The weakness of Bordeaux is that for some unknown reason, especially in some seasons, it will rust the fruit. Lime-Sulphur is cheaper than Bordeaux."

Upon the Coddling Moth spray, Mr. L. Caesar, of the Gueluh Agricultural College, of Ontario, in Bulletin 187, says:— "In some way not yet fully understood, the spray immediately after the blossoms drop, and before the calyx closes, will, if thoroughly done, kill not only the seventy-five per cent. that enters by the calyx, but also nearly all the remaining twenty-five per cent. which ordinarily enters by the side or stem end. Therefore this one application is all that is necessary for the control of the Coddling Moth in any district except where there is a large proportion of second brood."

General Remarks Upon Using Lime-Sulphur.

NIAGARA LIME-SULPHUR of 32 to 33 Baume test is very simple to use. Fill the spray barrel or tank with water, leaving room for the 4 to 1 gal. of Lime-Sulphur as the case may be, pour the Lime-Sulphur, which is as thin as water, into the barrel. It mixes as readily as water itself. Stir up the given quantity of Swift's Arsenate of Lead in about 3 to 4 quarts of water, add this the last thing and the mixture is ready to put on. The best way to open a barrel of Lime-Sulphur is to place it on two planks close by from where the water is filled, knock out the bung, tack a piece of leather around the hole, and roll the barrel towards you until it runs out. Do not knock in the head, for there is no need, as it does not require being kept stirred. All the sludge or sediment is taken out of Niagara Lime-Sulphur by forcing it through 10 oz. duck by a powerful pump.

Summer spray for apples, pears, plums, cherries and potatoes use at strength of 1 to 40 weakening it to 1 to 50 for the last spray. For peaches 1 to 100 or 200, for tomatoes 1 to 160.

Roughly speaking it will take for the dormant and summer spraying (5 in all) about 1 barrel of concentrated Niagara Lime-Sulphur to every 100 barrels of apples grown.

Agricultural Society Spraying Campaign.

At a recent meeting of the directors of the Sussex and Studholm Agricultural Society, Col. H. Montgomery-Campbell introduced the suggestion that the Society purchase and operate a Spraying outfit and spray the fruit trees and vegetable crops of the farmer members.

The idea was heartily endorsed by the directors and a strong committee was appointed to purchase the apparatus and map out a course of procedure.

The members of the Society will pay a nominal fee for the use of the machine and the time of the operator.

In view of the fact that spraying is not carried on very extensively by the members of the Society, Col. Montgomery-Campbell thinks this educational Spraying Campaign will prove a source of profit, in the shape of larger and better crops to all those who will take advantage of it.

How to Spray.

Extracts from Spray Calendar, 1911, by Prof. A. L. Melander, Entomologist, Pullman Station, Washington.

"Spray thoroughly. Direct your attention to the hardest places to reach. Cover every surface. Wet behind the buds. Reach the bottom of every crack. Fill the lower calyx cup. Do not try to economize on spray. For all orchard spraying use a high pressure pump, at least 200 lbs. Have a crook to set the nozzles at an angle of forty-five degrees. Spray from a tower if the trees are beyond your reach."

Russeting of Apples.

Russeting of apples by Lime-Sulphur, is, at least, rare and of minor importance as compared with that caused by Bordeaux. Considerable natural russeting occurred the past season (1910) on unsprayed trees, especially on Baldwins, caused by certain weather conditions. In our experiments there was in both seasons even less russeting on the Lime-Sulphur sprayed than on the unsprayed trees. We have not yet seen a clear case of russeting from Lime-Sulphur, but such have been reported, and we cannot dispute the possibility. Aside from the russeting, apples sprayed with Lime-Sulphur have invariably been more highly colored and had a finer, more waxy finish than those sprayed with Bordeaux.—Cornell Bulletin 284.

Do Not Add Lime to Lime-Sulphur.

Upon this subject Prof. Stewart, of the State College, Pennsylvania, says:— "Lime-Sulphur solutions are decomposed by a number of things. Acids, carbon dioxide, certain arsenicals, and even extra lime put in as a marker, all appear more or less to break down the Lime-Sulphur combination. We believe it to be avoided. When possible most of them can be avoided by elimination. In the case of our arsenicals, however, their addition is necessary if the material is to be used as a summer fungicide. The resulting compound seems to give good results particularly. The use of Paris Green in this solution we believe to be undesirable with nothing to commend it."

Chamberlain's Cough Remedy has won its great reputation and extensive sale by its remarkable cures of coughs, colds and croup. It can be depended upon. Try it. Sold by all Dealers.

DAIRYING.

Cost of Market Milk.

Dr. J. B. Lindsay, in the 22d annual report of the Massachusetts Agricultural Experiment station, has an article on the cost of producing market milk, which comes nearer the truth than anything I have yet seen in print; but in some respects his estimate is defective in my opinion. For instance, he estimates the cost of keeping a cow for a year at $69.-82 plus the cost of the food consumed by her, but from this he takes $22 as a credit for manure and calf; the calf consumes more than his value of milk before the bob veal or petty buyer comes around, and the older he is the more the farmer loses on him, so I would eliminate that $2 credit; as to the $20 worth of manure, I would also eliminate that credit, because it is a thoroughly figurative and imaginary value and does not in any way help the farmer to pay his bills. In common with many other agriculturists of practical experience, I consider farm manure worth just about the cost of handling it, and if a farmer has several hundred acres he will find it pays him better to buy chemicals for his outlying fields rather than haul manure to them and spread it. I have refused to buy manure at any price and refused to take it when offered to me for nothing, because I would have to haul it 4½ miles, considering the expense of handling greater than the value of the manure. Dr. Lindsay places the value of manure at $4 a cord; it could not be sold for that price here, or for half of it, and then the buyer would not be a farmer but some of our millionaire summer residents who wish to make grass grow on barren rocks. They buy what manure there is for sale around here for $1 to $1.50 a cord, but the demand is limited. I have frequently been offered manure if I would take it away, and I would do so if I did not have to haul it too far, otherwise I refuse, for the expense of hauling soon exceeds the value of the manure, that is, you can fertilizer your crops more cheaply with chemicals. Dr. Lindsay has forgotten one item of expense in the production of market milk and that is delivering it at the railroad station. Market milk is paid for at the railroad station and the cost of delivering it there is a part of the cost of production. This I estimate for such cows as Dr. Lindsay speaks of at from $8 to $12 per cow, or at 2 to 3 cents per 8½-quart can, which is probably too low, as it costs the average farmer more than that. This brings the cost of keeping a cow up to $170, and the cost of producing a quart of milk at exactly 5 cents per quart for a cow producing 400 cans of milk a year, or 7,310 pounds of milk, and 6 1-10 cents per quart for a cow producing 6,000 pounds of milk, or 328 cans.

Dr. Lindsay kindly tells us that his figures are for a cow producing 7,000 pounds of milk, and that for a cow producing 6,000 pounds of milk the food cost will be $6 or $8, or less; but neglects to say that for the cow producing 8,000 pounds of milk the cost would be correspondingly increased. His estimate for producing market milk for a cow giving 7,000 pounds is a fair average but is about one cent per quart too low, owing to his erroneous estimate of the value of the manure and to his neglect to include the cost of taking the milk to the railroad station.

The above calculation gives us 42½ cents per can of 8½ quarts of milk of average quality, delivered at the railroad station, as the cost of production to the farmer, and in order to make a urofit of one cent a quart he should get 51 cents a can at the railroad; instead he receives about half that amount in the 10-cent zone, so-called.

Dr. Lindsay also gives us the food cost of the Amherst herd for 1907-8. It amounts to 26.6 cents per can. The contractors in the two years paid an average of 25.9 cents a can in the 10-cent or average zone, or seven mills less than the food cost of producing milk at Amherst Experiment station. If any of the contractors see this, they may recollect my telling them that all they ever offered the farmers was practically the food cost of producing the milk. The above figures certainly bear out my statements. For the last 15 years the farmers have received practically about the food cost for the milk produced, or to take it differently, about half the cost of production, long experience having convinced me that the cost of production has been practically double the food cost. Elaborate and detailed statements will be found on examination to come within a small fraction of this every time, though of course this or that item will vary with the cost of local labor and this or that local condition.

A practical way to get at the cost of milk is to take the food cost and double it. There is no need to go into elaborate calculation of this or that cow's consumption and performance. It was proved years ago that it takes 100 pounds of good hay, or its equivalent, and 33 pounds of mixed grain to produce 100 pounds of milk. At the present prices of hay, this would bring the food cost of a can of milk to 35.2 cents. The con-

The Firm Behind
the seeds you buy is your only guide to quality. Whether the seeds are good or bad you cannot tell till you have planted them—you must buy on trust. A record of bumper crops for over 40 years proves beyond a doubt that

We also give an extra present for promptness, so write to-day. COBALT GOLD PEN CO., Dept. 613 Toronto, Ont.

Prove the "BISSELL" by Its Work

Do the gangs on your Harrow crowd together and raise out of the ground if it is hard? They won't do this on the "Bissell." The "Bissell" is so designed that THE GANGS CAN'T CROWD OR BUMP together no matter how hard the ground may be.

Tough soil won't stick the "Bissell." It stays right down to its work and pulverizes the ground thoroughly.

We ask you to take a "Bissell" out into the field and test it beside other Harrows. Then you will HAVE PROOF that it is A SUCCESS ON HARD LAND—THAT IT PULVERIZES THE BEST—and that it is the lightest draught.

Post yourself fully on Harrows before buying. We put our name on every Harrow so that you will know it is genuine. Ask your local dealer, or write to Dept M for free catalogue. 60

VELVET CREAM

The wealthiest, most particular and discriminating people on earth use the dining-car service of the great Canadian Pacific R. R., with its ocean-to-ocean trains, and that is why Tubular-made cream alone is served and satisfies the management of that railroad.

It costs them more money, and Mr. John McFadyen's dairy at Parkbeg, Sask., with a Tubular at the head of it, gets the benefit in big profits.

The great New York Central R. R. gets Tubular cream for its dining cars from Mr. Geo. H. Sweet, East Aurora, N. Y., and both the railroad company and Mr. Sweet profit from the velvety Tubular cream.

THE SHARPLES
Tubular Cream Separators
MAKE GREATEST PROFITS

for the keenest, best informed dairymen everywhere. They know they must have Tubulars to get perfect cream and to get it all. Disk-filled or otherwise complicated separators lose cream, spoil its quality and give what is termed a "metallic" or "disky" flavor to it.

Dairy Tubulars contain no disks or other contraptions and produce velvety cream of perfect flavor which brings fancy prices.

Tubulars have twice the skimming force of others, skim twice as clean, wear longer and run easier.

If it's not a Sharples it's not a Tubular, and you are not getting all the profits.

GUARANTEE MOTOR CO. Bay St., North Hamilton, Ont.

tractors are now paying 35 cents in the 10-cent zone, about the food cost of the milk, which as I have said before, has been their practice for years. This state of things has driven the milk producers in the metropolitan district out of business as they found themselves getting poorer every year. The few large farmers in this town who are producing milk for the Boston market are gradually giving it up, finding themselves with less money than they had five years ago.

I myself stopped making milk for the Boston market three years ago. Since then I have averaged 13½ per cent. net profit on a fair valuation for my farm instead of losing 30 per cent. as I did when selling milk to the contractors. This shows the fault is not with the land nor with the farmers, but with the conditions besetting the milk business. As long as the farmer is willing to sell the crops he raises, in the shape of milk, at half their market value, so long he will remain a poor man with no chance of attaining ease and independence.

A great deal has been said about ensilage cheapening the production of milk. While rendering due credit to the merits of ensilage, when we remember that it takes 300 to 400 pounds of ensilage to have the feeding value of 100 pounds of good hay, and that the manure and labor cost that will produce 15 or 20 tons of ensilage will give us four tons of good hay to the acre, it is not easy to see where the economy comes in, except as a matter of figures, for the ensilage having no market value is figured at cost price, but take the feeding value, if we take 350 pounds of good ensilage to have the feeding value of 100 pounds of good hay, and take Dr. Lindsay's value of $3.75 a ton for ensilage then it would take $13.12 to raise the feeding value of a ton of good hay in the shape of ensilage, and the ton of good hay can be raised for less money, and every pound of fertilizer to do it purchased at that.

There remains the question of succulence: For this purpose, I would rather have beets, and the acre of ground that will produce 15 or 20 tons of ensilage will produce 40 or 50 tons of mangel beets. I will say in conclusion that I have tried many kinds of feed for cattle and conducted many tests of cattle so that I know exactly what results I was getting, and I have never found a feed that would take the place of good early cut hay, properly cured and therefore containing plenty of digestible nutrients. If you have not some of this quality of hay to feed you will not get the best results possible from your cattle.

In regard to the rule laid down here of 100 pounds of hay, or its equivalent, and 33 pounds of grain, to 100 pounds of milk, it applies only to good dairy cows; it will apply even to phenomenal producers. A large Holstein cow producing 100 pounds of milk a day will consume a bushel of mixed grain weighing a pound to the quart and all sorts of roughage besides, the marvelous thing about the highest class pure-bred cows being, not that they produce milk from little feed, but that they are able to assimilate tremendous quantities of food and turn them into milk. Another item of expense in the raising of market milk is the loss of fertility to the land. Each cow producing 8,000 pounds of milk takes about 700 pounds of milk solids not fat from the land, made from its most fertile constituents and these must be replaced by purchased fertilizers, and on this account I consider Dr. Lindsay's estimate of food cost in addition to the 20 weeks' pasturage lower than it should be, both to maintain the flow of milk and the fertility of the pasture.—John B. Marcou, Princeton, Mass.

This Food-Tonic Quickly Restores Strength

After a serious illness, ordinary food should be supplemented by a strengthening tonic. For this purpose

NA-DRU-CO Tasteless Cod Liver Oil Compound

is recommended very highly. In its preparation the disagreeable flavor of the natural Cod Liver Oil is entirely removed, while its well known nourishing and tissue-building qualities are retained. There are also Hypophosphites to strengthen the nerves, Extract of Wild Cherry for the Lungs and Bronchial Tubes, and Extract of Malt (a food itself) which aids in the assimilation of other foods.

Children in particular enjoy the pleasant flavor of Na-Dru-Co Tasteless Cod Liver Oil Compound, and quickly regain health and strength when Nature is aided by this natural tonic. **Your Druggist has it** in 50c. and $1.00 Bottles.

LIVE STOCK.

Why is Sheep Breeding on the Decline ?

Editor Maritime Farmer:—

Why are sheep decreasing in numbers in the Maritime Provinces? is the question we often hear asked of late years. Is it because they do not pay? Is it because they are too much trouble? Or is it the indifference of our farmers to know a good thing when they see it?

The Dominion Government appointed a commission to investigate the sheep industry; they have made their report. It is well worth perusing and farmers who are at all interested should write the Department of Agriculture, at Ottawa, for a copy. It contains a fund of information. It may seem at a casual thought that a subject so old and one upon which so much has been said and written must of necessity be wholly exhausted; but sheep husbandry has occupied the attention of man from the early days of the patriarchs down through all ages to the present time and will continue to do so as long as the world lasts.

The crucial test by which all business transactions are tried is the one of profit—"Does it or will it pay?" Sheep raising should be no exception to the rule, and yet we are of the opinion that too many who are keeping sheep in these Provinces have but a vague idea how the balance sheet stands with their flock at the end of the year. Perhaps having read the Spanish proverb that "Wherever the foot of the sheep touches the land is turned to gold," they take it for granted that they are making money. That a profit and a good one will ensue from the keeping of a flock of good sheep and caring well for them there is no question, and that even the poorest flock and worst kept possibly may not run their owner in debt, which if proven speaks well for the sheep, but is no particular credit to the man who owns them.

Care and selection in breeding should be more closely followed, one needs only a glance at the flocks on the hillsides to notice this. The difficulties under which many farmers seem to labor is that they have no fixed purpose in their breeding. A mongrel ram should not be allowed in any flock. He will either have a very small preponderance of coarse wool or the same of fine wool, in one case you will soon be out of wool, in the other he will find himself pretty near out of muttom. This state of things is usually the outgrowth of the indifference to the wants and requirements of the flock or the insatiable desire for low priced rams. There is no excuse for this state of affairs for any farmer. We have to-day through the provinces some fine flocks of pure-bred sheep from which good breeding stock can be obtained at very reasonable prices. In the upper provinces are to be found flocks of all the best breeds from which any of our farmers can purchase foundation stock for their flocks. With prices double what they were a few years ago, and the demand greater than the supply, it looks as though the farmers, more especially those in the eastern part of Nova Scotia were losing an opportunity to make a good profit, and at the same time enrich their fields and rid them of weeds.

There are thousands of acres of land lying idle to-day, almost under the shadow of, at least, in sight of, the smoke of the great industrial centres of Eastern Nova Scotia, that can be profitably utilized in the sheep industry.—A. Hector Cutten, Colchester Co., N. S.

Dentition in Pigs.

When full grown the pig has twelve incisors and four canines, an equal number in each jaw. The central pair of incisors are known as nippers; the teeth right and left of these are the intermediaries, and the other pair the corners. At three months all the milk teeth, which include the nippers, the intermediaries, and the corner incisors will have appeared. At six months they have reached full size, and are supplemented more prominently by the tusks. To quote next from the "Book of the Pig." "As soon as the four middle front teeth of the lower jaw have reached their full length they will present an evenly rounded front, but soon afterwards the edges of their crowns begin to wear off, first on the nippers, and afterwards on the intermediary incisors. At the sixth month of the pig's age the so-called wolf teeth (which lie between the tusks and the molars in the lower jaw) break through the gum." The corner incisors and the tusks are shed shortly before or during the ninth month, while the nippers are shed with the beginning of the twelfth month. Those who have examined the teeth of the pig cannot mistake the milk teeth for the permanent teeth, and this applies more especially to the nippers and intermediate incisors. It appears, therefore, to me that up to the age of a year there is no better way of determining in a simple way, as when judging, the age of a pig than by an examination of the front teeth. I am well aware that conditions differ, and in consequence the dates of alteration in the appearance of the teeth, but while I have not referred to the action of veterinarians when a case is referred to them, I adhere to my statement that the front teeth are an indication of age in the young pig, and one which is quite sufficient for the judge.

—James Long.

Managing Vicious Bulls.

Recently a neighbor of mine was severely injured by his herd bull. The animal has proved to be an extra good sire and is a valuable animal, and for this reason has been retained in service, although during his years of usefulness he has been a very stubborn beast and difficult to handle. The owner has never attempted to employ any means by which the bull might be kept under control, but has always allowed him to have a "head of his own," and anyone's life is at stake when approaching him.

Probably the safest and simplest means of handling an animal of this sort is to blindfold him. He may be managed by means of ropes and pulleys, giving him room to move out of his stall when required and bringing him back to his place, but it is a cumbersome method. Blindfolding quietly takes all the conceit out of a blusterer. A broad bandage of double sacking securely fastened over his eyes may serve the purpose ordinarily in the stable. This device may be used to good advantage in handling a nervous or excitable beast while being led to market, or drawn in a wagon to be shipped on a train. I remember a case of a heifer received on the train being so wildly excited that she would jump at a person approaching her to untie her halter, but by throwing a blanket over her head and afterward tying a sack over her eyes she was quietly unloaded and tied behind a wagon which she followed as meekly as one could desire.

Mismanagement or lack of thought makes a great deal of trouble in the handling of stock. Often we see men chasing pigs all over the place in the vain effort to get them into a pen, the animals always going in the direction contrary to the one they

THE TELL-TALE TEST

To test the quality of Molassine Meal, we bought a pair of cattle from Nova Scotia, on October 7th, 1911. The animals were in fairly good condition, weighing respectively, 1465 and 1585 pounds. On arrival at St. John, they were stabled, and, for thirty-four days, fed on One Pint of Corn Meal mixed with a quart of Molassine Meal three times a day. They were weighed again on November 11th., when they tipped the scale at 1745 and 1855 pounds each, showing a total gain of 550 pounds. They were sold to Mr. M. J. Collins, of Fairville, N. B., a copy of whose letter, given below, tells its own story.

WHAT MR. COLLINS HAS TO SAY

Fairville, N. B., Nov. 15th, 1911.

Messrs L. C. Prime Co., Ltd.,
South Wharf, St. John, N. B.

Dear Sirs:—"The pair of Cattle purchased from you were knocked down the first of the week and I am now writing to inform you that we have never handled better beef. This beef was equal to anything coming from the West and weighed when dressed 2185 pounds.

"I can honestly say that I know of nothing that is equal to Molassine Meal for bringing Live Stock into good condition quickly."

Yours truly,
(Signed) M. J. COLLINS.

As this letter is Proof Positive of the Superior Nutritive Qualities of

MOLASSINE MEAL

The Feed That is a Feed

We need only add that It Is Not a Medicine, but An Ideal Vegetable Stock Food, combining the very Best Properties Mother Nature Has to Offer for producing Strong, Healthy, Heavy Animals. Its use prevents disease in cattle, sheep and swine, increasing their weight and creating a vastly superior quality of beef, mutton and pork.

Fed to Horses, Molassine Meal makes greater strength and staying powers, also, keeps their coats smooth, silky and glossy.

Molassine Meal is the only stock food containing molasses that can be fed freely to animals without fear of injuring them.

LET US HEAR FROM YOU

We can furnish the names of many satisfied users of Molassine Meal, and will be glad to answer any questions you care to ask about it.

If your dealer cannot supply you with Molassine Meal, write us and we will see that you get it.

MORE POTATOES PER ACRE

Do you want to increase your potato crop 10 to 57 bushels per acre and thereby increase your profits $5 to $57 per acre?
The Iron Age Planter is the one machine with which an absolutely perfect stand can be obtained. At the Maine Experiment Station the yield where the

IRON AGE

8was used was 75 bushels per acre more than where one of the best of the "Picker" machines planted. It makes no misses, no doubles, injures no seed

In Idaho, Herbert Lambing, a former Iowa Agricultural College student, has gained attention by his big crops, due to scientific methods. He writes in part; "The *Iron Age* means just one half my crop this year." Let it secure for you a perfect stand, a bigger yield and more profit. Ask your dealer to show you the Iron Age Planter, with or without fertilizer attachment. Write us for special booklet and Mr. Lambing's complete letter. Both will interest you. This planter is but one tool in our complete line of Iron Age farm and garden implements. You should know them all.

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all Dealers.

are desired to go, while by having a pair of low light hurdles hinged together forming a v-shaped guide the animals can be handled quickly and with the use of no unseemly words. Vicious bulls are generally made so by unwise treatment when young, giving them too much liberty, or using them cruelly. It is well to use them kindly, but they should be trusted no more than is necessary, for it sometimes happens that a bull that has been quiet suddenly and unexpectedly becomes vicious and maims a man for life or gores him to death. It is the part of wisdom to handle a bull with a strong staff and a safe connection with his nose-ring no matter how quiet he may be. —O. F. Taylor in Breeders' Gazette.

Valuable Cow Ruined.

There is no period in the life of a cow when she requires and should receive more attention than at the time of freshening, owing to the fact that she is so susceptible to complication of diseases such as milk fever, retention of the afterbirth, stoppage or paralysis of the bowels, mammitis or inflammation of the udder and many other diseases.

Among these mentioned perhaps the retention of the afterbirth is the most common and while it does not necessarily terminate fatally, it is exceedingly successful in ruining a cow as a profit producer. The afterbirth is oftentimes retained owing to the fact that the cow has been given cold water at the time of freshening, or permitted to freshen in a cold, damp stable, or out in the rain when the weather is unfavorable.

When the afterbirth is retained it should not be removed by main force owing to the fact that parts will remain. These parts are converted into matter which set up an intense inflammation, causing a catarrhal condition of the genital organs. The animal absorbs the pus which forms from the retained parts and the absorbing of such decomposed tissue upsets the entire system of the animal. This pus is excreted from the system to some extent from the kidneys, bowels, and udder, thus rendering the milk from a cow that has retained her afterbirth unfit for human food.

Cows thus afflicted should be given a dry, clean, well-ventilated, box-stall. A blanket should be placed upon them in cold weather. They should be given ground oats, bran, good clover or alfalfa hay, plenty of water with the chill taken from it, and such medicine as will have a tendency to ripen and expel the afterbirth. The genital organs should be washed out with an antiseptic solution and in this way a cow which has retained her afterbirth will soon be put in a strong, healthy, profitable condition, whereas if she was neglected she would be ruined as a profit producer.—Dr. David Roberts, Waukesha, Wis.

Feed Rack and Manger.

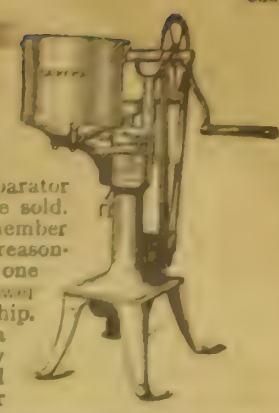
Two parts oats and one of bran make a well-balanced grain ration for pregnant ewes.

Now and then put a little brine on the straw. It acts as an appetizer, and the sheep clean up the straw better.

Expect any young lambs? They will bring you some money, providing you can get them through. To do that you must give them a good warm place to stay and plenty of juicy food for the ewes. Winter lambs are nice and all right, but you must get a hustle on you to save them, all the same.

More animals, more feed crops, more diversification, more rotation, more cultivation, more manure, more system, more planning—mean more prosperity.

The Best Cream Separator is the Cheapest in the End



THE cost of manufacturing a cream separator determines the price at which it may be sold. Therefore, when selecting a separator, remember that the machines which are offered at an unreasonably low price can be offered at that price for one reason only—they are built to sell at prices lower than the cost of good material or workmanship.

Such separators are costly at any price. Only a good separator is cheap; not because of a low first cost, but because it will last for years and save enough butterfat from the milk of four or five cows every year to pay for itself. The best workmanship and material that money can buy are used in making

I H C Cream Harvesters Dairymaid and Bluebell

You will find an I H C the cheapest separator you can buy, because it will do better work and last longer than any other separator.

Go to the nearest I H C dealer who handles these separators and see how carefully they are made. You will find that they have phosphor bronze bushings—that the gears are spiral cut—are entirely protected from grit and milk, and at the same time are easily accessible.

The neck bearing is trouble-proof. The patented dirt-arrester chamber removes impurities before separation begins. These separators are made in four sizes. Ask the I H C local agent to show you one, and give you a catalogue, or, write the nearest branch house for catalogue and any other information desired

THE HORSE.

Some Facts About Shying.

The theory generally held that shying is commonly the result of defective vision on the part of a horse has probably bery little, if any, justification in fact. It may be doubted whether horses ever shy because of distorted vision. That horses may suffer from defective eyesight without showing a trace of actual disease of the eye is doubtless undisputable. But it does not necessarily give rise to shying. Take the case of a horse which shies at certain objects, such as a heap of stones or mud-scrapings lying at the roadside, and assume, for argument's sake, that owing to impaired vision it gets a distorted view of these objects. How is the animal to know that the object appears distorted to it? The heap of stones, perhaps, does look to it something different from what it really is; let us say, like a sack of potatoes or a collection of rubbish, yet it must be all the same to the horse whether it sees a heap of stones or a sack of potatoes or rubbish or what not, it being no worse off in that than a horse with perfect vision. If this matter is logically thought out one must inevitably come to the conclusion that defective vision can hardly be a potent cause of shying in horses.

THE CAUSE OF SHYING.

The principal cause of shying in horses is nervousness, and it is well known that by far the largest proportion of shyers are met with among horses of either a highly nervous or else a very timid temperament—the latter especially. There would undoubtedly be a great many more cases of shying among well-bred horses, which possess a decidedly sensitive nervous organisation, if it were not for the fact that the high courage characteristic of them neutralises their constitutionally nervous character. Therein we also have an explanation of the fact why entires are so much less liable to shy than mares.

IN YOUNG HORSES.

No particular importance need be attached to the habit of shying at unfamiliar objects commonly met with in raw young horses when first brought to work. There are many sights on the road which they have never seen before, and which, therefore, have a somewhat terrifying effect upon them at first, until they have familiarised themselves with those various objects; but it cannot be too strongly insisted upon that a young horse needs to be treated with the greatest forbearance and gentleness when it shies or makes a feint as if about to do so on meeting anything which excites its apprehension. It should be cajoled and spoken to soothingly, so as to allay its fears and give it confidence. Given such patient management all tendency to shy will, in average cases, sooner or later be overcome. If harsh methods and punishment are resorted to, the animal being forced past the object of which it is afraid at the point of the whip, the consequences may be disastrous. Such irrational procedure is a prolific cause of turning young horses into confirmed shyers. The animal comes to connect the sight of an object which excites its fears with punishment, and it shies from sheer apprehension of being punished whenever an unfamiliar sight is encountered. Once the habit of shying has become firmly ingrained, whatever the original cause, it is practically impossible to cure, even with the most patient treatment, and the less one has to do with a bad shyer, especially for saddle work, the better. The most suitable place for such a horse is in double harness, where it cannot do much, if any, harm, for though it may attempt to shy its mate usually will prevent it from actually swerving or stopping dead. It is an established fact that horses are less liable to shy when driven in harness than when ridden. This is partly, perhaps, owing to their wearing blinkers, which prevents them from seeing some things which might otherwise startle them, but it is also largely due to the fact that, being harnessed to a vehicle, they cannot swerve or break out so easily as when carrying a rider.—Argus.

About Parasites on Colts.

Weanlings are frequently troubled to a considerable extent with intestinal worms of various kinds, especially if grazed on low-lying pastures in late summer or early fall. Some of these parasites are more to be dreaded than others, but none of them are desirable guests or in any way beneficial to their involuntary hosts, and it is therefore advisable to take measures for their removal.

The old farmer's remedy of wood ashes and salt is not to be laughed at in this connection, and if persevered with in small doses for some time will often have the desired effect, but where a more speedy and certain riddance is desired it is well to give a course of anthelmintic powders, as iron sulphate one drachm or powdered arecanut two or three drachms twice a day in a little soft food for a week, to be followed by a drench composed of turpentine one ounce, and raw linseed oil from 10 ounces to a pint, according to the size and condition of the patient. This mixture should be given on an empty stomach and all dry food withheld until the bowels have responded to its action.

INJECTIONS FOR WORMS.

In all cases of intestinal worms, benefit is found from occasional injections of tepid water strongly impregnated with soap, and for this purpose Gamgee's enema funnel, a cheap and convenient instrument easily turned out by any tin-smith, will be found suitable. Some varieties of worms demand for their successful removal a repetition of the medicinal treatment, but those most commonly met are generally satisfactorily disposed of at the first attempt.

External parasites should also be guarded against. Many a good colt has gone to skin and bone from the constant irritation and uneasiness produced by lice, and whenever a young animal shows unaccountable loss of condition and want of thrift it is advisable to examine him closely for signs of the presence of these undesirable companions.

A CURE FOR LICE.

Should they be detected, the sufferer may in reasonably mild weather be washed well with carbolic soap and soft warm water, and after thoroughly drying the skin, carefully and closely dressed more particularly about the roots of the mane, with a good insecticide. For this purpose an ointment composed of equal parts

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

by weight of sulphur and lard will be found effectual, as also safe, cheap and easily procured. In cold weather the washing must of course be dispensed with, but the ointment may be applied without risk in a moderately warm stable at any season of the year.—Dr. J. G. Rutherford, Live Stock Commissioner, Ottawa.

Shoulder Injuries on Horses.

If the shoulders of the work horses are neglected during the idle months of winter, the animal is in no condition for spring work.

The causes of shoulder galls and abscesses are ill-fitting and dirty collars, also horses unaccustomed to work are put at hard, continuous pulling before the shoulders become toughened. The first symptom of a sore shoulder is that the hair stands erect in the location of the injury. Later, if the animal is continued at work with the same kind of collar, the skin and hair slough, leaving a raw, bleeding surface. The size of the sore may be from that of a silver dollar up to three inches in diameter.

The sore shoulder causes the horse considerable pain, and if not relieved the animal soon loses flesh, and may cause a sound animal to become balky.

Many times a soft swelling appears just above the point of the shoulder. If opened at the outset, a straw-colored liquid escapes. On the other hand, if not molested it becomes infected and an abscess forms.

These abscesses are often superficial, but may be deeply seated and require expert attention. The deep abscesses may be located six inches or more below the surface of the skin, between the shoulder joint and the chest wall. These abscesses often prove serious and should only be treated by a qualified veterinarian.

By way of prevention of shoulder abscesses and galls, give particular attention to the collar. See that it fits snugly at the top and only room enough between the neck and collar to admit the arm. Also remember that the collar should be kept clean. Wash the dried sweat off the collar at night, and bathe the shoulders with cold water after the horse is unharnessed.—C. L. Barnes, Colorado Agricultural College.

You can say goodbye to constipation with a clear conscience if you use Chamberlain's Tablets. Many have been permanently cured by their use. For sale by all Dealers.

Care of Horses in Spring Time.

Editor Maritime Farmer:—

There is no feed or care too good for the farm work horse, more especially at this time of year, as it is near the time when the very busy work on the farm will begin.

As a rule, many farmers are overanxious to get all the work done they can, so as to get their crops planted as soon as possible, and sometimes work their horses harder than they should. It must be remembered that the horse is less able to stand hard work early in the spring than at any other time, on account of his long rest from labor. Then, too, the change from cold to warmer weather, and his shedding or changing his old coat for a new one all have a tendency to weaken his vitality.

It is well to govern him for a time with tight lines and stop him quite frequently for a few days until he becomes accustomed to steady work again.

As a heavy grain ration is not usually necessary nor desirable for horses that are not constantly employed during the winter, they need a little more grain as spring approaches.

I feed my horses good clover hay because I believe it is the best kind of hay to give farm horses. Timothy may be best to feed horses that work in the city, but in my estimation the best rough feed that can be procured for farm work horses is good clover hay, cut before it is too ripe and put up without rain. It also saves grain.

Regularity in feeding is a matter of considerable importance. It is never best to feed the horse one morning at four o'clock and the next morning at seven, or miss one feed and give him twice the amount the next time.

I always water my horses before feeding for two reasons—to wash out the mouth, throat and stomach, and to keep from washing the feed out of the stomach before it is digested. During the busy season the horses should be given fresh water at least once between morning and the noon hour, and once between noon and quitting time. It takes a little time, of course, but the horses can do more work and they will keep in better condition.

It pays after the cold days are over and the warmdays of spring time are here, to clip the horses; that is, if the proper care is to be taken of them. They will stand more work and do it with more comfort.

The currycomb and brush should be freely used at least once a day when the horses are at work and brought in warm. They should not be compelled to endure the night with their legs covered with mud and the hair baked on them, but should be given a good rubbing.

Their feet need careful attention, and they should be shod when they need it without delay. It is never best, under any circumstances, to drive a horse on the road when his feet are worn and tender. If the hoofs get hard and are inclined to contract, they can be softened with tar or axle grease.

It is essential to keep the harness in good condition, especially collars, sweat-pads and traces. It is well to have three or four pads for each horse. And they should not be changed from one horse to another; they will not fit. If the pads are washed occasionally they will keep soft and pliable. It is the continued sweating and wearing rough collars and pads that so often cause sore shoulder.—F. A., Pictou Co., N. S.

POULTRY.

Poultry Notes.

Lame chickens and bumblefoot are very often the result of too high roosts, especially for the heavy breeds.

Milk is valuable in many ways for poultry. Nothing equals it for mixing up all kinds of soft or ground food.

Keep a daily account of the receipts and expenses with the poultry. This is the only way to know whether they pay or not.

As soon as the young roosters are old enough to sell they should be sold. As soon as their combs grow they are then classed as "old roosters" and do not command a very large price.

Feeding Early Chickens.

There are two distinct methods of feeding young chickens in vogue at the present time, each of which possesses advantages and disadvantages. Some breeders prefer one method, some another, while some prefer a combination of the two. As I try to show below, I think the combination is the best paln. Until a few years ago there was but one plan in common use, the moist, and breeders had no option but to feed their chickens upon a soft diet. The dry system, so-called in contradistinction to the moist, was introduced about ten years ago, at once becoming very popular indeed. I think I am right in claiming that I was one of the first in this country to adopt the new method and I am bound to admit that it has rendered winter rearing a much simpler task than it had been hitherto. At the same time the moist method possesses some advantages. In order to make comparisons I purpose dealing briefly with the two systems of feeding young chickens. The moist method is first discussed.

EARLY DAYS.

The recognised, and by far the best moist diet for the first few days consists of hard-boiled eggs, chopped up finely, mixed with breadcrumbs or biscuit meal, and moistened with warm water or sweet milk. Biscuit meal is preferable to breadcrumbs since the latter has rather a constipating effect. Milk, too, is preferable to water, as it has so excellent a feeding value. No food whatever is given during the twenty-four hours immediately succeeding the chicken's exit from the shell; this applies to which ever method is adopted. The portion which remains of the yolk sac is absorbed into the body of the chicken just before it emerges from the shell, and this contains sufficient nutriment for the period named. The first meal is given about twenty-four to thirty hours after the exit of the chicken. The mixture referred to above is, in my opinion, the best, but there are some who prefer giving a custard pudding during the first few days. This, however, I do not recommend.

THE LATER DIET.

If the chickens are thriving well the egg may be discontinued at the end of four or five days, and during the following week or so biscuit meal or some such specially prepared cooked chicken food should form the staple diet. If the chickens are rather backward it pays to continue the egg longer. Although apparently rather an expensive food, it is not so really since it is unnecessary to use new-laid eggs for the purpose. What are termed "cooking" eggs answer capitally, and are very cheap. Infertile eggs, too, which have been tested and rejected on the seventh day do quite nicely, and the value of these is practically nothing. After the chickens are ten days old a variety of foods may be employed, retaining biscuit meal or some such specially prepared food as the basis. Ground oats, barley meal, and middlings are all useful meals, either mixed together or used alone. Whatever meal or meals are employed, however, it is very important indeed to give them fairly dry and not sloppy. A crumbly moist condition is the best. If chickens are

Put Your Feet in a Pair at Our Risk!

STEEL SHOES

Will Surprise and Delight You With Their Lightness, Neatness and Comfort —Their Almost Unbelievable Durability

We want you to slip your feet into a pair of Steel Shoes—to **feel** and **see** and **know** how much **lighter, neater, stronger,** more **comfortable** they are than any other work shoes in existence. Hence we are making this special **Free Examination Offer,** merely asking a deposit of the price, while you are "sizing up" the shoes. If they fail to convince you **immediately** you can notify us to send for them at our expense and we will refund your money.

Must Sell Themselves

We ask no favors for Steel Shoes. Compare them with the best all-leather work shoes you can find.

Give them the most rigid inspection **inside and out.**

Let them tell their own story. It's **no sale** unless, of your own accord, you decide that you **must have them.**

Better Than the Best All-Leather Work Shoes

Steel Shoes are the strongest and easiest working shoes made. There's more good wear in **one pair** of Steel Shoes than in **three to six pairs** of the best all-leather work shoes. The leather is waterproof. The Steel Soles are **wear-proof** and **rust-resisting.**

They are **lighter** than all-leather work shoes.

Need no breaking in. Comfortable from the first moment you put them on.

Impossible to get out of shape. They keep the feet dry. They retain their flexibility in spite of mud, slush or water. They cure corns and bunions, prevents colds and rheumatism—save doctors' bills and medicines.

FREE!

Send for Book, **"The Sole of Steel,"** or order Steel Shoes direct from this ad.

Thousands of Farmers Shout Their Praises

The enthusiasm of users knows no bounds. People can't say enough for their comfort, economy, lightness and astonishing durability. The introduction of Steel Shoes in a neighborhood always arouses such interest that an avalanche of orders follows.

Here is the way Steel Shoes are made: The uppers are made of a superior quality of leather, as **water-proof as leather can be tanned.** Wonderfully soft and pliable—**never gets stiff!** The soles and sides are made out of one piece of special, light, thin, springy, rust-resisting Steel. Soles and heels are studded with adjustable Steel Rivets, which prevent the bottoms from wearing out. Rivets easily replaced when partly worn. 50 extra rivets cost only 30 cents and should keep the shoes in good repair for at least two years! No other repairs ever needed! The uppers are tightly joined to the steel by small rivets of rust resisting metal, so that no water can get between.

The soles are lined with soft, springy, comfortable Hair Cushions, which absorb perspiration and odors and add to ease of walking.

For Men—Sizes 5 to 12

6, 9, 12 and 16 Inches High

Steel Shoes, 6 inches high, extra grade of leather, black or tan color, $3.50 per pair.

Steel Shoes, 9 inches high, extra grade of leather, black or tan color, $5.00 per pair.

Steel Shoes, 12 inches high, extra grade of leather, black or tan color, $6.00 per pair.

Steel Shoes, 16 inches high, extra grade of leather, black or tan color, $7.00 per pair.

For Boys—Sizes 1 to 4

Boys' Steel Shoes, 6 inches high, $2.50 per pair.

Boys' Steel Shoes, 9 inches high, extra grade of leather, **black or tan color,** $3.50 per pair.

N. M. RUTHSTEIN,

The Steel Shoe Man

Overwhelmed by the World-Wide Demand

The success of Steel Shoes is almost startling. Within three years we have established Steel Shoe factories in Racine, Wis.; Toronto, Canada, and Northampton, England. These great factories, running at full capacity, can scarcely keep up with the demand from all over the world. The public is rapidly learning that Steel Shoes are

Good for the Feet! Good for the Health! Good for the Bank Account!

These shoes are better for the feet, better for the health, better for the pocketbook than heavy work shoes or rubber boots.

You Actually Save $5 to $10 a Year

by wearing Steel Shoes. Figure it out for yourself. One pair will outlast 3 to 6 pairs of ordinary work shoes. They save all repair bills and keep your feet in perfect condition.

Free Examination

And Your Money Back Promptly If It Looks Better Than the Shoes!

You owe it to yourself to Investigate. Get a pair of Steel Shoes for Free Examination by sending the price, which will be returned if you and **your own feet** are not convinced of their merits.

WHY WAIT? SEND NOW!

No risk! No bother! No obligation! Don't hesitate! Act while this offer is open! Simply state size of shoe you wear, enclose the price and get the shoes for Free Examination.

For **general field work** we strongly recommend our 6-inch high Steel Shoes at $3.50 per pair or the 9-inch at $5.00 per pair. For all classes of use requiring high cut shoes our 12 or 16 inch high Steel Shoes are absolutely indispensable.

supplied with sloppy foods they are almost sure to suffer from bowel complaints, one of the most common ailments affecting young stock. Boiled rice is a suitable food, but careful preparation is necessary. To one part of "paddy" or chicken rice three parts of water should be added, and the two allowed to simmer on a fire till all the water is absorbed.

SOME IMPORTANT DETAILS.

It is extremely important when this method of feeding is adopted to give the chickens so many meals a day, allowing them to eat as much as they will at each meal, but removing the food when their appetites are satisfied. It is as bad for chickens as it is for children to be continually eating between meals. They should have as much as they want at a time, but nothing between. Small troughs or wooden blocks should be used for feeding, and never on any account should the soft food be thrown down upon the ground, for the chickens trample upon it, making it unfit to eat. Besides injuring their health, a large quantity of food is wasted. It is a debateable point whether it is advisable to give drinking water or not. Personally, I think the chickens, when being fed on moist foods, are all the better without until they are a month or five weeks old; many poultry-keepers, however, disagree with this, and supply water from the first. I do not think it is a very important matter—the important thing is that if water is supplied it shall be quite fresh. It should be renewed two or three times daily, for stale or tainted water is an almost certain forerunner of disease. During the first week of their lives feeding should take place every three hours from about 6.30 or 7 a.m. till 9.30 or 10 p.m. The last meal or two must be given by lamp light. During tne second, third, and fourth weeks five meals a day are sufficient, after which age four meals daily suffice. When the chickens are from six to eight weeks old a little grain may be given to them. Cracked wheat, cracked maize, or some of the smaller grains are suitable. Care must be taken in giving the wheat and maize to see that it is cracked, and not crushed, for in the latter condition it is bad for the birds. If a good sample of tail wheat can be obtained this answers the purpose admirably.

ADVANTAGES AND DISADVANTAGES.

There are two chief drawbacks to the moist method of feeding, and there are two advantages. Perhaps the chief drawback is the fact that under this system bowel complaints are of rather frequent occurrence. Particularly early in the season is this the case, for when the days are fine and more or less warm the exercise the youngsters are able to procure counteracts the tendency to bowel troubles. It is difficult under any circumstances to persuade chickens to take sufficient exercise; when feeding on moist foods it is doubly difficult. The other drawback is the large amount of labour necessary to prepare the food and to feed the chickens so many times a day. The preparation of the food involves much time and labour, since it has to be prepared for each meal, besides which feeding has to take place early in the morning and late at night. The advantages of feeding chickens on moist foods are that growth is very rapid and that the flesh is made soft and tender. This latter point is of importance with chickens intended for the market. Fatteners do not care very much for dry-fed chickens, since they assert that their flesh is hard and their crops small, thus rendering the fattening process more difficult. For rearing chickens for table purposes, therefore, the moist system is the better, seeing that development is more rapid and the fattening possibilities greater.—E. T. Brown.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Mother.

There is a shrine whose golden gate
  Was opened by the hand of God;
It stands serene, inviolate,
  Though millions have its pavement trod;
As fresh as when the first sunrise
Awoke the lark in Paradise.

'Tis compassed with the dust and toil
  Of common days, yet should their fall
A single speck, a single soil,
  Upon the whiteness of its wall,
The angels' tears in tender rain
Would make the temple theirs again.

Without, the world is tired and old,
  But once within the enchanted door
The mists of time are backward rolled,
  And creeds and ages are no more;
But all the human-hearted meet
In one communion, vast and sweet.

I enter; all is simply fair;
  Nor incense clouds, nor carven throne;
But in the fragrant morning air
  A gentle lady sits alone.
My mother—ah! whom shall I see
Within, save ever only thee!

—Digby Mackworth-Dolben.

Love's Barrier.

(Continued from last issue).

CHAPTER XIX.

THE ORDEAL.

The heavy rustle of Mrs. Hayes' silk skirts broke the tense silence. She rose from her chair with a conscious pride to receive her guests, and make the important introduction. She had time, however, to notice the distinction of Mrs. Secretan's dress, the consummate grace with which it was worn. She also noticed, however, that she was extremely pale.

"So glad you were able to come. Permit me to introduce Major Hunt—our dear friends Mr. and Mrs. Secretan, Gerald, of whom we have talked so much."

Helen met Hunt's eyes clearly, and gave a slight bow. He fully understood that she desired to ignore their past acquaintance, and while it secretly piqued him, he could do no other than fall into line with her mute suggestion.

He murmured something about the pleasure it was to meet her. Secretan, less cold, offered a frank hand, and when Helen saw it she drew a step back. Audrey went to her side, and drew her down on the couch, ready to speak from an overflowing heart.

"Gerald and I were so sorry to find you out when we called yesterday. I have been simply dying to see you, darling, and thought tonight would never come. Don't you think I am a lucky girl?"

Helen did not at once reply. She felt the room reeling round her, and wondered how she would get through the ordeal of the meal in front of her. The last straw would be if she had to go down on Hunt's arm, but she comforted herself with the assurance that it would not be possible, she being the only lady guest. The men had already grouped themselves about the log fire, which burned so cheerfully in the wide low grate; fortunately Hunt's back was turned to her.

"What do you think of him? Isn't he handsome, Mrs. Secretan?" asked Audrey, with all a girl's pride in her first real lover.

"Yes," admitted Helen, but her voice sounded far away and unreal even in her own ears. "He is certainly very handsome."

"And isn't it wonderful that such a brave, clever soldier should stoop to a girl like me, a little country girl, who knows so little, and has never seen anything?"

"That is your particular charm, dear; you are so natural and so fresh—an unblown bud on the tree," said Helen mechanically, though she tried her utmost to speak naturally. Audrey looked a little perplexed, missing the usual warm sympathy, the quick comment, the look of live and loving interest in the eyes of the woman she had learned to look up to and to love, with all that girlish enthusiasm which finds its outlet in the making of heroes and heroines, until some of the grey realities of life somewhat dim the happy quest.

"Dear, I don't think you are bery well. You are so frightfully pale, and your hands are cold," she said anxiously. "But I have never seen you look so sweet. There is something about you which allures people. Can't you see the Rector's eyes always turning this way, and if Gerald were not very stupid, he would turn round, too."

"He would have eyes for no one but you, Audrey," said Helen, forced to say the obvious, but putting no life into her words. "Yes, Mr. Hayes."

She was glad when their host, who was a warm friend of the Secretans, and of whom Helen was specially fond, came to her side to offer his arm.

"Dinner is served, I think. We are all very glad to be back again on the moors. Foreign places have their charms, I don't doubt, but, after all, England is always home."

Helen rose and laid her hand on his arm. Her fingers touched it a little convulsively as she passed close by Hunt and felt his eyes upon her. The expression on his face, however, was inscrutable; it was only his eyes which were filled with a sombre fire. He followed with Audrey, laughing and chattering by his side, and so came to the dining-room, where they assembled at a round table, which afforded Helen no screen. She was seated so that Gerald Hunt could obtain a full view of her face, and note its every expression. Helen was a clever woman, who on more than one occasion in the past had been compelled to play a part, but never one like this. She had decided on a moment's impulse, which came from she knew not whither, that she would meet Hunt as a stranger. She could not have given any reason for such a course, except that she required some time in which to gather and regulate her thoughts and face the full significance of what had happened and what was going to happen.

Hunt had accepted her cue, and after the first moment of awkwardness passed off, he settled down to enjoy himself. The finding of Helen here in this unexpected house gave an odd piquancy to the situation. He was sufficiently man of the world to be able to extract its full flavour. And he admired Helen exceedingly. She had acquired dignity, repose and a new and altogether indescribable charm for which he could not account. He had always admired her; had, indeed, cared as much for her as it was possible for a heart so wholly selfish to care for another, and now that she was altogether out of his reach, the old spell seemed to spring upon him again. He had difficulty in keeping his eyes from her face. A delicate flush began to creep through the whiteness of her skin, after she had yielded to her host's entreaty, and tasted the champagne which foamed in her glass.

"We must drink to the young couple, you know," he said with an air of fatherly pride, as he raised his glass. "It is a very special night."

Helen raised her glass also, and just touched it with her lips. Secretan's hearty response made up for her coldness, and the incident passed without any outward sign.

The dinner was not very long. Mrs. Hayes had profited by her few entries into good society to observe its customs, and had grasped the fact that the acme of the caterer's art is to produce the perfect in little. Hunt was indeed amazed at the super-excellence of everything, at the quiet richness of the table appointments, and the solid British comfort of his future father-in-law's abode. As the dinner proceeded he became a little more daring, and decided that he would punish Helen for her cut direct.

"Audrey tells me you lived at Colchester before your marriage, Mrs. Secretan," he said, with a studied politeness. "You and I must have mutual acquaintances, I feel sure, even if we did not meet during my all too brief sojourn there. Did you know the Langton Gores at Gore Farm?"

"My father knew them well; we did not exchange visits after his death," replied Helen, forcing herself to speak with a cold naturalness which amazed herself.

"And the Willoughbys at Dedham? I think you must have known them. Constance Willoughby, you remember, who married Jimmy Graves."

The Willoughbys had been Helen's most intimate friends, and it was at their house they had first met.

"Yes, I knew them, too."

"Isn't it delightful to find you have so many mutual acquaintances," said Audrey artlessly, as she leaned her round, perfectly moulded elbows on the table and nodded delightedly across at Helen. Dessert was on the table, but nobody seemed in a hurry to rise. Helen, feeling herself desperate, looked with a gesture of quite genuine appeal at Mrs. Hayes. That good lady saw that Mrs. Secretan looked not quite like herself, and considerately rose.

"Are you feeling the room a little hot, dear Mrs. Secretan?" she said anxiously, always very affectionate to the Rector's wife, since she had discovered her intimacy with the Duchess. Helen would have been surprised had she known how often her name and that of the Duchess of Eastwater had been coupled on Mrs. Hayes' lips at Marienbad during the past six weeks.

"I do feel it a little hot. Yes I shall be glad to go upstairs."

She swept from her chair, and carrying herself with a regal grace, followed her hostess from the room, Audrey bringing up the rear with her arm thrown affectionately about her waist the moment the door closed.

"I'm so glad you made mamma get up," she whispered. "I'm simply dying to hear what you think of Gerald. Isn't he clever? When I heard him and Mr. Secretan discussing the frontier question in India I felt how little I knew. I hope you liked him, Mrs. Secretan."

Helen did not immediately reply. Something was tightening about her heart. They got to the drawing-room, and Audrey placed Mrs. Secretan in a very comfortable corner of a big Chesterfield couch, and went to get a stool for her feet. When she came back something about Helen caused her to give a shrill cry.

"Mummy, there's something the matter with Mrs. Secretan; come quick!"

Helen had fainted.

Mrs. Hayes did not lose her head in an emergency, and she was genuinely concerned at the apparent indisposition of her guest. Her motherly heart warmed to her, and she bent over her with a quite real tenderness while she despatched Audrey for Tremlitt and restoratives. A little brandy quickly revived her, and Helen sat up looking much ashamed of herself.

"Dear Mrs. Hayes, I can never forgive myself. I have not been feeling very well all day; in fact, I have been lying down the best part of it. I ought to have sent an apology, and allowed Claude to come himself. I hope you will forgive me."

"Forgive you, my dear—what is there to forgive? There, Tremlitt, take that cushion from Mrs. Secretan's feet. You can go now and make a good cup of tea, and we will come to the boudoir for it. It will be better for Mrs. Secretan now than the coffee."

The footman entered with the coffee-tray at the moment, and Audrey busied herself with the cups. When the man had retired again, Mrs. Hayes on nodding her head at the same went on nodding her head at the same time as if she fully grasped the situation and knew how to deal with it. Bending over Mrs. Secretan she patted her shoulder kindly.

"It often came over me like that

THE BEST REMEDY

For Women—Lydia E. Pinkham's Vegetable Compound

Belleville, Ont.—"I was so weak and worn out from a female weakness that I concluded to try Lydia E. Pinkham's Vegetable Compound. I took several bottles of it, and I gained strength so rapidly that it seemed to make a new woman of me. I can do as good a day's work as I ever did. I sincerely bless the day that I made up my mind to take your medicine for female weakness, and I am exceedingly grateful to you for your kind letters, as I certainly profited by them. I give you permission to publish this any time you wish."—Mrs. Albert Wickett, Belleville, Ontario, Canada.

Women everywhere should remember that there is no other remedy known to medicine that will cure female weakness and so successfully carry women through the Change of Life as Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs.

For 30 years it has been curing women from the worst forms of female ills—inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, and nervous prostration.

If you want special advice write for it to Mrs. Pinkham, Lynn, Mass. It is free and always helpful.

Minard's Liniment Co., Limited.

Gentlemen,—My daughter, 13 years old, was thrown from a sleigh and injured her elbow so badly it remained stiff and very painful for three years. Four bottles of MINARD'S LINIMENT completely cured her and she has not been troubled for two years.

Yours truly,
J. B. Livesque.

St. Joseph, P. O., 13th Aug., 1900.

before Audrey was born," she whispered. "It need not alarm you in the least, I am sure."

Helen's colour came back with a rush, and she tried to get to her feet.

"I am really quite all right, and there is no need to trouble about getting tea. I assure you I am quite all right." Audrey, a little puzzled, and much concerned, hovered about anxiously. Helen gave a little hysterical laugh. "It was ridiculous to go off like that, but don't look so troubled, I assure you it won't happen again."

She refused to move from her corner, or to accept Mrs. Hayes' suggestion that she should go and lie down in her boudoir; and when Audrey went out to tell Tremlitt to bring the tea to the drawing-room, Helen looked at Mrs. Hayes.

"Please don't say anything about this to my husband, Mrs. Hayes. He would exaggerate it. He will not notice anything, and I assure you it has not done me the least harm."

Mrs. Hayes shook her head.

"You have to be very—very careful," she began; and Helen laughed a little hardy.

"It is not as you think. There is nothing. It is only the heat, and because I felt stupidly tired before I came."

"You didn't look tired, I assure you. I never saw you so brilliant, and how you talked at the table! I haven't got any of that sort of talk. My gifts have always lain in other directions."

Mrs. Hayes uttered these words in a tone of slightly virtuous complaint, as if to imply that the more solid characteristics did not always meet with their full appreciation.

"Did I talk too much? I suppose I did not notice it."

"Oh, nobody thought so; I'm sure the gentlemen didn't. Did you not see how interested Major Hunt was? How do you like him, Mrs. Secretan? Tell me as long as we are alone. Don't you think he is a very distinguished looking man?"

"Very," replied Helen, thankful that she could answer the latter query with perfect truth.

"And his aunt, Lady Angela, has quite the air of the grande dame. But her and me" (sometimes, even yet, when she was a little carried away, Mrs. Hayes made sad grammatical lapses)—"her and me got very intimate. How fond she is of that boy! She could not love him any better if he were her own son. Of course, they are not very rich, but as I said to Mr. Hayes, riches aren't everything. And we shall be able to give Audrey a very handsome income, even while her father is alive. I wonder how Audrey will like the roving life. It's the only thing I don't like about the affair. If only he could have got a nice place. The family place is in Worcestershire, near Hagley, I am told; and I'm sure Mr. Hayes wouldn't quarrel about the price if it could be brought back, and they could settle on it. But Major Hunt won't leave the army just yet. He's keen on active service, and they're expecting to get some, it seems, sooner or later in India. Of course, Audrey doesn't know that. She would worry herself into her grave about it, poor child. It is not very easy to be a soldier's wife."

"Are they going to be married soon?" Helen forced herself to ask.

"Gerald wants it to be before Christmas," whispered Mrs. Hayes proudly and mysteriously. "But Geoffrey hasn't given his consent yet. I suppose he will have to. Ah, here is Audrey."

The door opened and Audrey came in, followed by Tremlitt with the tea-tray.

Helen drank her tea feverishly and felt stimulated by it. Her eyes had their brightness restored to them; indeed, they seemed to shine unnaturally.

To Prevent Chapped Skin

—use warm water and Baby's Own Soap.

The warm water opens the pores of the skin and the minute particles of pure refined vegetable oils which form the creamy, fragrant lather of Baby's Own Soap are absorbed into the skin, keeping it soft, healthy, and preventing cracks and chaps.

A perfect rinsing, then smart rubbing when drying guarantees a fine smooth skin in any weather.

BABY'S OWN SOAP Best for Baby Best for You 2-12

Canada's Standard toilet and nursery soap for over 30 years.

ALBERT SOAPS, LIMITED. - MONTREAL.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, **my home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. **Men cannot** understand women's sufferings. What we women know **from experience,** we know better than any doctor. **I know** that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharge, Ulceration Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - WINDSOR, ONT.

HEADACHE

Seems To Be Habitual With Many People.

Some are seldom, if ever, free from it, suffering continually and wondering why they can get no relief.

Headaches are generally caused by some derangement of the stomach or bowels, or both.

Burdock Blood Bitters removes acidity of the stomach, improves digestion, regulates the constipated bowels, and promotes a perfect circulation of pure blood to all portions of the body, thereby curing the headaches by removing the cause.

Mrs. L. Maguire, Kinmount, Ont., writes:—"I am writing you a few lines to tell you what your Burdock Blood Bitters has done for me. I used to be greatly troubled with headaches, but after using two bottles of Burdock Blood Bitters I was completely cured. This was two years ago and I have had no return of headache since."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

A SPEEDY CURE

Kentville, N. S., January 1st, 1910.

Messrs. C. Gates, Son & Co.,

Gentlemen,—This is to inform you that I have been a sufferer for the last fourteen years from kidney and stomach trouble, brought on by severe colds. Having been laid up every winter during that time. Last year I was laid up for seven months, so that I could not go out of the house. Dropsy set in, and my stomach swelled so that I was six inches larger than my usual size, had two doctors in attendance, but I grew worse and they were going to tap me—my friends despaired of my life. At this time I was recommended to use Gates' Life of Man Bitters and Invigorating Syrup No. 1. and in one week after commencing their use, my size was reduced two inches, and in four weeks was reduced to my usual size, so that I went to work in my mills, and have been able to continue it ever since. By continuing the use of your BITTERS and SYRUP, I hope to get a cure of the kidney and stomach trouble so far as it is possible, as it always helps me when I take it. You may make these truths known for the benefit of sufferers. Yours very gratefully,

John W. Margeson.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

"You won't mind if we go rather soon," said she when the sound of voices was wafted up the wide staircase, indicating that the gentlemen were leaving the dining-room.

Mrs. Hayes nodded.

"Just wait till they have been here a few moments, and I will order the carriage."

The door opened, and Mr. Hayes came in alone.

"Gerald and Mr. Secretan have gone back to smoke another cigar," he said genially. "They got on uncommonly well together; so well, indeed, that I thought I'd just slip up where my company might be a little more appreciated."

He smiled and nodded to Helen, and finally took a seat on the end of the couch beside her. Helen's colour, now quite hectic in her cheek, receded.

Why had they gone back? It was most unusual. Had Gerald Hunt any sinister meaning by it? Would he speak to Claude about the past; drop poison into his honest, unsuspicious mind? The idea was intolerable. She scarcely knew wnat was passing around her; she listened mechanically to her host's remarks, to the interludes made by the other two, but was not really conscious of their actual portent. Her whole heart and being were downstairs at that table where her husband and her old lover were tete-a-tete. Presently Mr. Hayes begged for a little music.

"It will bring them up quicker than anything. Major Hunt sings well, and when he hears your fine touch on the piano, Mrs. Secretan, he won't be able to resist coming up."

Helen rose, thankful to get away from the kindly small talk, the need to listen, and to answer. She could be alone there in the dim corner where the tall palms almost hid the instrument from view, and she knew that its touch would soothe her as nothing else could. She rose and glided across the room, pulling her lace scarf about her shoulders with a gesture of infinite grace. Audrey came forward, and asked whether she should turn up the electric light, arranged so cunningly to send the soft glow down upon the keys.

"No, thank you, dear; I'm only going to play a little from memory. Go and talk to your dear father. This will put me quite all right."

Audrey obeyed instantly, and Helen began to play. In spite of the contemptuous way she had summed up her accomplishments to Secretan, she played really well, with a little appealing individual touch which always compelled people to listen. It soothed tham all. Mrs. Hayes began to nod in the depths of her capacious easy chairf She had eaten a very good dinner, and the slight excitement over Mrs. Secretan had left her a trifle tired. Audrey and her father continued to talk in whispers, she leaning against him, her head on his shoulder.

So the two from the dining-room found the room when they entered it. Helen felt them come rather than saw them, but, hardening her face, she played on, without so much as one false note. She knew that Hunt would come to her side, and she wished it. She had something to say. In a moment of time her mind was made up. The purity, the childlikeness of Audrey Hayes, the knowledge of the sheltered life she had led, of her total unfitness for the life to which a man of Hunt's type would introduce her, filled her for a moment with a vast dismay. She had suffered so much herself, she would save another woman, especially the child she loved, and whose sweet affection had added so much to her happiness in Midcar Rectory, she would save her from a life that could only end in misery for her.

Hunt strolled up the room, and came behind the great palms which eyes quite clearly and unfalteringly shut them off practically from the to his face. She waited as the most end where the others were grouped. casual acquaintance might have done Helen played on, and when Hunt for him to speak.
stopped by her side, she lifted her (Continued in next issue).

CURIOSITY Prompted Many Women To Try PURITY FLOUR

THEY were curious to see exactly what results would be produced by flour *consisting entirely of the high-grade portions* of the best Western hard wheat.

They were curious to know more about a flour that contained none of the low-grade portions, which are found in every wheat berry, but which are separated and excluded from the high-grade in the process of milling PURITY FLOUR.

THEY were curious to know whether an ALL HIGH-GRADE hard wheat flour was really superior to a mixed hard and soft wheat flour.

They were curious to see and taste the kind of bread, buns, biscuits, cakes and pies PURITY FLOUR would make.

Curiosity prompts you to seek the knowledge they discovered. It's urging you to try PURITY FLOUR.

REMINDER: On account of the *extra* strength and *extra* quality of PURITY FLOUR it is necessary, for best pastry-results, to add *more* shortening than you are accustomed to use with an ordinary flour. Add *more* water when making bread.

Add PURITY FLOUR to your grocery list right now

PURITY FLOUR

"More bread and better bread"

HAND SPRAMOTORS.

No. 1 and 2, with horse-drawn cart, can be used on orchards, vines, row crops or weeds. As shown here it is arranged for row crops and weeds, but separate attachments adapt it to other uses.

Adjustable width of track and rows, all-brass Spramotor, brass ball valves, automatic agitator and compensating plunger. High grade throughout. For one horse only.

Price $47 to $54

Awarded Two Gold Medals at National Horticultural Congress

W. C. HEARD, 1381 King St., LONDON, CAN.

Sleeplessness.

It is most important that the digestion should be in perfect working order, food being taken at regular hours, and the bowels opened daily. Light food only should be taken, and above all things, avoid a late meal. The evening meal should be taken no later than 7 p.m. Tea should be taken once a day only. Instead of drinking tea three or four times a day try Sanatogen. This can be mixed withmilk, cocoa, and Benger's Food and taken in many other ways. It is a very soothing, light food, and a good plan is to take it at breakfast, after lunch. and at bed time. It should be given in hot milk or Benger's Food after the person has retired to bed. This should prove a great aid to sleep, as the nerves gradually become quiet and soothed. Sometimes a glass of hot water or lemonade will have the desired effect. On no account take whisky or brandy, as in nine cases out of ten it tends to wake the person up, besides being injurious to good health. It is of great importance to find out the cause of sleeplessness. Often it is want of exercise and fresh air. A good walk every day and sleeping in a room with the window open are most essential. Cold feet may be another cause. Never go to bed with cold feet and legs, trusting to a hot water bottle to warm them. The feet should be bathed in warm (not hot) water, to which has been added a little mustard. Well rub dry with a good rough bath towel; this will aid the circulation of the whole body. Massage of the feet, legs, or head will often induce sleep when other methods fail. Reading by the aid of a candle some book, not too exacting, is very beneficial to some people. A light diet, fresh air, exercise, and daily movement of the bowels should remove all tendency to sleeplessness. One should always remember a person of sixty-seven years will not require the same amount of sleep as another of twenty-one years.

Baby's Ears.

There are various little things associated with the toilet which have an important bearing upon the health and hygiene of baby during the first year. When the ears are not attended to properly, troublesome eczema often occurs. After the ears have been well washed with a little warm soap and water they should be well dried. This is best done with a soft piece of linen handkerchief, or a little cotton wool. The mother should never push the corner of a towel into the delicate ear structure with the idea of thoroughly drying the part. She may by so doing cause chronic deafness, as the ear drum is so easily injured in infancy. Any undue redness or rash round about the ear should be treated with zinc ointment, rubbed in immediately after baby's toilet is completed. Many a mother would be saved a good deal of worry over sore ears, eyes and mouth if proper attention were only given to the bathing and drying of the child. The old saying, "Prevention is better than cure," should always be borne in mind by the young inexperienced mother.

Picture Hanging.

To hang pictures to nails driven into a wall is not the best or most convenient way, for if at any time it is required to rearrange them it may be necessary to draw the nails and drive them in the wall again elsewhere, leaving behind an unsightly hole and break in the wallpaper or distemper. A good and convenient way is to fasten a rail to a wall to within a few inches of the ceiling. Drive into the wall two or three wooden plugs, to which the rail should be screwed. The rail needs a groove along the top to carry the hooks, these can be moved to any part of the rail, and cost a few cents per dozen. Hang the pictures to these by picture wire, which is preferable to the old cord, as it will not rot so quickly. A metal barrel rod may take the place of the wooden rail if need be. The brackets to which it is fixed must not, however, jut out too much away from the wall. A damp wall is often the ruin of many a work of art, but it is also often the ruin of another work of "art"—the wallpaper—through the lower end of a frame lodging against the wall and causing an unsigntly dust mark. Avoid this by screwing a small piece of rubber or cork to each back lower corner of the frame, which keeps it from coming into close contact with the wall and allows free play of air and prevents the collection of dust.—G. A. C.

Washing Utensils.

Baths and all washing utensils need regular and thorough cleansing; it is not sufficient that they get only the one swill round of cold or even warm water after immediate use. but they should be well brushed out with hot, soft, soapy water, then swilled several times with clean water, and kept well on the move all the time, so that no soapy scum or poisonous matter may remain to cause an unsightly dusky stain. This stale scum or other stain may be easily removed from porcelain ware with a little dampened salt rubbed in with a cloth and then rinsed away. Should the trouble occur to an enamelled article it is rather more difficult to be rid of, and may mean a fresh covering of enamel or paint. Any accumulations of stale dirt or grease on zinc or galvanised iron ware will readily yield to a little mixture of paraffin finely powdered bath brick, and elbow grease; the last well applied often restores an article to its original beauty. All articles of wood need an occasional scrubbing with strong hot soapsuds and plenty of swilling with clean water.—G. A. C.

Apple Rice Pudding.

Pare and quarter four medium-sized tart apples, and lay them loosely on a buttered pudding-mould; turn over them a quart of milk in which has been dissolved three-quarters of a cupful of sugar. Sift three tablespoonfuls of rice over the top, pressing it gently under the milk; add a few bits of butter, and bake slowly for four hours. Serve with plain sweetened cream.

Breakfast Croutons.

Cut some remains of ham in dice, and toss them till hot over the fire, with a little pepper, minced onions, parsley, and mushrooms (if at hand); now stir into the mixture the yolks of two eggs, watch them till they are just on the point of setting, then put the whole on to squares of hot buttered toast, dust with a little pepper, and serve very hot.

The Spring Fashion Book of Canada Is Ready For You

If you are not already on our mailing list, send in your name to-day for a copy. You will be delighted with It!

It is a work of art and shows the very latest styles before the public, and at reasonable prices which will appeal to you. Nagging of Children.

A Physical Trainer, in Orff's Review, has given the following, which should be read and reread by parents:

A child that is nagged at never holds itself well. Its deportment betrays its mental attitude, and to the trained eye of the physical training instructor the round shoulders and apologetic air tell their own story in the case of a child whose physique otherwise reveals no sign of constitutional weakness.

The attitude of the body discloses in a marvelous way that of the mind, and many parents would be astonished to learn that the bearing of their children reflected their home influences in a very unflattering light.

"I want to walk as though I owned the street," said a lady to me one day. "That's the way my sister walks—can't you teach me to do the same?" I tried. But after weeks of fruitless effort, I discovered the reason why no amount of instruction would give this woman the queenly bearing she coveted. She lived in terror of her husband. I had previously expended similar fruitless efforts on her children. Their carriage was the same as their mother's! Doubtless they received the same treatment from their father.

For of what is this hollow chest a sign except that the child treated unsympathetically shrinks into itself? What is this drooping head but an outward expression of fear within? And what does this poking chin suggest but obstinacy and defiance?

The only way to correct the defect is to remove the cause. An atmosphere of appreciation and loving sympathy will induce fearlessness, cultivate self-confidence, and elicit good will, traits which unfailingly express themselves in a child's appearance.

Whilst lunching with a lady the other day, I listened to a tale of distress about her little boy's flat chest. Presently the child came in from school with colored pictures. "Oh, yes, dear, but don't start with it now; go and wash your hands and get tidy." The child's enthusiastic little face fell, his flat little chest seemed flatter still, and he resignedly put away his book and left the room. There will be little chance for that child's chest until his mother learns to express her affection more positively in the form of active and ready sympathy, not merely negatively in the form af anxiety. The glow of enthusiasm which was swelling the child's heart, literally as well as metaphorically, was quenched by the chilly reception. The expanded chest which accompanied the movement of enthusiasm collapsed at once like a pricked bubble.

The most affectionate parents are often the worst sinners in this respect, and their anxiety for their children's welfare often takes the form of continuous reproof, indicating a lack of wisdom rather than of love.

"Oh, my dear child, do put your shoulders back! How often have I told you——" That is the constantly reiterated phrase, and constant reiteration is perhaps the most painful form of "nagging."

What is the use of telling the same thing in the same way so many times? If the nineteenth time of telling has had no lasting effect, why should the twentieth?

The only sound course is to find some other method of bringing about the desired result. The most potent weapon is the power of an idea. Endless nagging will never do more than weary the child and make it obstinate or sulky, and an obstinate or sulky child always becomes round shoulder, just as a shy, self-conscious child will always poke her head forward.

Even though at each reproof the child may make a spasmodic effort to correct the defect, no lasting result will accrue, because the predominant mental attitude will always beget the habitual bearing. No physical instruction can produce the carriage that every one delights to see unless there is a measure of confidence and self-esteem behind it. Self-confidence and self-esteem come hard to a little girl who is always conscious that other people have a poor opinion of her. Self-confidence indeed seldom comes to her at all, except through the expressed confidence. So it is useless to tell a girl to hold herself up, and at once follow the admonition by querulous criticism and unfavorable comparison with others.

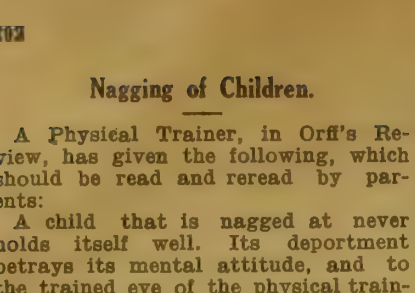
There should be in the carriage something beyond more than an erect spine, flat shoulder-blades and a head held high; something subtle and striking, potent and attractive, and dependent entirely on the attitude of the mind. The self-reliant deportment of the confident woman who knows that she is capable of taking care of herself; the joyous, happy gait of the young girl to whom the world is always in blossom; the quiet, masterful air of power and dignity of the person who holds a position of responsibility—all bespeak a very different mental attitude from that represented by the apologetic, conciliatory, sulky, or semi-defiant bearing of those who live perpetually in an atmosphere of reproachful criticism.

Give your children, therefore, encouragement, rather than criticism, sympathy rather than reproof, and, whilst they are in the awkward age, at least, do not add to their self-consciousness by constantly drawing attention to their faults.

I have seen a little girl in school suddenly transformed by one word of praise from the teacher; a poor little child, it was accustomed only to scolding and punishment, and the unusual praise acted on her like a charm. Each little advance was rewarded with more praise, and so the charm continued and the transformation became a permanency.

Another case I remember of a girl of really exceptional beauty, almost entirely spoilt by a shy self-conscious awkwardness. Her head, Juno-like though it was, poked itself forward. She was strong and healthy, but seemed unable to hold herself correctly. It was only a school play that worked the reform, an amateur play in which she took an important part; a splendid, stately role which she filled with brilliant success. She became absorbed in her "part," lost her self-consciousness, and rose that evening to the superb and stately woman that she has remained ever since. It is the power of an idea.

But nagging is fatal.



"Knack"

"Knack" is not needed to make good coffee every time. Follow the directions in each sealed tin of Red Rose Coffee; and in six minutes the small crushed grains give you the full strength and brisk flavor of this choice coffee. There is no dust, so Red Rose Coffee requires no "settling." No chaff, so no bitter taste. You will surely like

Red Rose Coffee

This Morning

millions of people enjoyed the flavor found in Quaker Oats---found in this oatmeal alone.

Think how Quaker Oats has become the world's breakfast.

Just because we pick out the rich, plump grains—we get but ten pounds from a bushel.

And because we prepare them in this delicious way.

This best of the oat foods—this cream of the oats—costs but one-half cent per dish.

Does it pay, do you think, to get a lesser oatmeal?

Look for the Quaker trademark on every package.

Buttered Eggs.

Make three pieces of toast, butter them, and put them on a hot dish before the fire to keep hot. Put about 1 oz. of butter into a small enamelled saucepan, and while it is getting hot beat two eggs to a froth, add a tablespoonful of cream or milk, and a little salt and pepper. Pour this mixture on the hot butter, and stir it over the fire until the eggs show signs of setting, then draw the saucepan to one side, and continue to stir until the mixture is soft and creamy like custard, but do not allow it to become lumpy. Pile it on the buttered toast, and serve it as quickly as possible.

"Will You Keep Your Hands Off?"

There is no action for which young children have to be more frequently corrected than that of fingering things. The active, healthy child shows its curiosity chiefly through the fingers. We all know how extremely difficult it is to restrain them from touching something new and strange which is shown to them. If asked what they would like at table, out goes the hand and touches the desired piece of cake or scone. Put on a new frock or blouse, and it is handled all over, the texture felt critically by little palms, and the buttons, laces, and ribbons fumbled by none too clean fingers. Sit down to a piece of sewing or knitting which is not familiar to the little ones, and soon they are pulling at it, handling the thread, and very likely interfering with your movements till you are compelled to order them peremptorily to keep their hands off. A number of parcels brought from town have an irresistible attraction for them. It seems impossible for those young hands to let them alone.

And yet if those young eyes were incurious, and the small hands never attempted to meddle, the child could never learn anything. We, who have forgotten how we learnt the most important things, can hardly realise that without touch, eyesight would be of no value. Sight alone could not teach us the character of water, wood, fire, green leaves, and the infinite variety of things around us.

WIN A PRIZE

GIVEN AWAY

And many other Prizes according to the simple Conditions of the Contest (which will be sent).

Each one of the above four lines of figures spells a word. This most interesting puzzle can be solved with a little study, as follows: There are twenty-six letters in the alphabet, and we have used figures in spelling the four words instead of letters. Letter A is number 1, B number 2, C number 3, etc., throughout the alphabet.

USE YOUR BRAINS. Try and make out the four words. ACT QUICKLY.

This is a chance for clever persons to win Cash and other Prizes with a little effort. Write the four words, with your name and address, neatly on a piece of paper or post card and mail to us, and we will write you at once, telling you all about it. You may win a valuable prize. Act Promptly.

DOMINION PREMIUM CO. 210 St. James St. (Dept. 91b MONTREAL

The sense of touch is closely connected not only with every other sense, but with the higher nerve-centres of the brain, and without it the brain could not act at all. So that the children are merely obeying an overmastering instinct of the brain when they handle everything—even forbidden things—which they see.

One of the characteristics of feeble-minded children is that they show little, if any, desire to finger things as if they were examining them, and the hands are always defective. One of the first things a physician tests when he is consulted by a patient suffering from nervous disorder of any kind, is the hand. He examines the wrist, the fingers, the thumb, the palm, stretches the hand, and tests the muscles and sinews; finally, he tries the grip. If there is any weakening there, it is a sign of weakness in the higher nerve-centres. I knew a child who seemed all right in childhood, but who showed serious deficiences in his teens. When I asked his mother if she had noticed anything wrong when he was a child, she said, yes, she had always noticed that his hands were not so active as they should be. We should be thankful for the meddling, mischievous fingers of the little busybodies, and when they must be checked for touching things they would injure, see that they get something to themselves to rough handle, and not be too faultnnding when they finger our parcels and our clothes.

The Preparation of Roes.

In our plain Scotch household there was a sort of contempt for the internal parts of animals as food—such as kidney, liver, sweet-bread; only one member confessed to a taste for tripe, and another to a liking for kidney, and these had to indulge their taste a solitaire. Roes were rejected as offal, and it was not until I was grown-up that I was introduced to the delicacy of a herring roe at another table. A roe, like a sweetbread, has very little pronounced flavour of its own, and must be served with something to give it piquancy. The chief roes which are used are those of the herring, the cod, and the bloater. Plain boiled, these can be cut into slices quickly while hot, and served in a tomato sauce or any other sharp flavoured hot sauce.

A very good way of doing herring roes is to cut them small, fry gently for a few minutes in butter; then add a seasoning of salt and pepper, two tablespoonfuls of cream; thicken with a beaten egg, and serve on toast. Lest some reader should have in mind the old saw, "Bile stanes wi' butter, an' the brew 'ill be gude," I must add that the roes are quite toothsome fried with butter alone and served on hot buttered toast. They must be well seasoned; a pinch of cayenne is an improvement.

Cod's roe is not quite so delicate as that of the herring, although it can be treated in the same way. Here is a recipe for it: Boil until tender as much as is required; let it get cold, then pound it, add a tablespoonful of butter (to ½ lb. of roe), pepper, salt, cayenne to taste; mix well together; melt a small piece of butter in a pan, stir in the roe, sharpen with a squeeze of lemon, and when quite hot, serve on toast.

For a sandwich paste, pound some cooked roe with the yolk of a hard-boiled egg, a slice of butter (weight for weight of roe and butter), pepper, and a little grated cheese. Use as a paste, or rub through a sieve, heap upon buttered brown bread, and serve as a garnished dish.—Gretchen.
as a garnished dish.—Gretchen in Scottish Farmer.

Sick Headache Cures.

Sick headache, while not dangerous, is one of the most disagreeable forms of illness. Some women are subject to it at such frequent intervals that they are incapacitated for several days at a time.

Unless the headache is known to come from some functional disorder it can generally be traced to impaired digestion or a sluggish liver. These must be treated in the interims of the headaches, as at the time nothing but alleviating remedies are possible.

A treatment that is often successful is to abstain from red meats for a time and to be careful about taking foods that ferment easily. One man who had doctored for years for sick headaches was cured by his wife seeing to it that he drank a cup of hot water with a half teaspoonful of salt in it as soon as he arose in the morning.

A half lemon in a glass of cold water taken night and morning is another remedy that has proved helpful to many.

During the attack rest and quiet are imperative. Lie down in a darkened room, drink quantities of hot water and apply either a hot water bottle or an ice bag to the temples and the base of the brain.

Cloths rung out of hot witch hazel often bring quick relief. Headache cologne if rubbed on the temples in time acts as a preventive, while some sufferers are helped by taking a cathartic at the first symptom.

In severe cases five or ten minutes' treatment with an electric battery is invaluable. This is better than massage, as the pressure is sometimes too strong when the headache is bad.

In the first stages of sick headache it can often be averted by taking abdominal and neck exercises and by putting a mustard plaster over the stomach.

FREE
GIRLS
Girls, Here is Your Chance to Obtain FREE a Handsome Bisque DOLL
Do you want to receive Free a beautiful doll? We have them for you. Our large handsome doll will sit down, fold its arms, turn its head, shut its eyes and go to sleep like a real baby, the best kind of a doll, 18 inches tall, with long curly hair, real eye lashes, handsome turning Bisque head, full jointed body, pearly teeth, very stylishly dressed, fancy underwear, with hat, shoes, stockings, etc., dressed completely from head to shoes, free to you for selling only 15 packages of our famous Marvel Bluing at only 10c per package. We send a beautiful finished Turquoise Brooch to give to every customer who buys a package from you. This makes them sell quickly
Return the $1.50 when sold and we will promptly send you this handsome doll. Write to-day. Address Dept 77

Those Wedding Gifts.

Whenever we think about the great number of people we know who are constantly getting married—that is, the marriages are constantly taking place all about us, it makes us sit up and think.

We are great people, we are. In our kitchen there is a bum old coffee pot that we have intended replacing as soon as the Nickleodeon store gets a fresh supply. It will cost us ten cents then, and the robbers now want a quarter.

Over at the McKinney's is a beautiful vase we gave them when they were married, not long ago. It set us back seven dollars, but we gladly did it.

Then we gave a set of china to Mabel and Tom. It was a pretty set, too, and cost $27.35 with the case.. Also Dick and Mary came in for a gift. It was a nice silver coffee pot—wish we had one like it, don't you?

These are just a few. We've given wedding presents to most everybody we know so far this year. We're glad to, you know, but it seems queer to give people a set of knives and forks when we haven't enough in the house to enable us to entertain two people.

Some of these days we'll do like the man back in the east, who looked for sales and bought a large number of wedding presents, all alike, and stored them away. Whenever anybody got married he dug out one of these and sent it. Surely. Why not?

Once a man, though, bought part of a lot of little mirrors with fancy frames—nice ones, too. He began giving these as presents, and presently it became known to him that other people were onto his plan, for they bought mirrors themselves, and at one prominent wedding fourteen of them came—all alike.—Galveston News.

"Eastlake" Steel Shingles

will save you money

Exclusive Features

By

The Philosopher of Metallic Town

"EASTLAKE"
STEEL SHINGLES

The Experimental Farm at Guelph Ontario ranks as one of the best in the World.

There, the farm buildings are roofed with Eastlake Steel Shingles

Some of these buildings were roofed 18 years ago —all are in perfect condition to-day.

A pretty stiff durability test, don't you think?

It's the **"Eastlake"** exclusive features, that no other metal shingles possess, that count.

The single side-lock and gutter—the **"Eastlake"** counter-sunk cleat—and three-inch lap.

The **"Eastlake"** single side-lock makes it the easiest and quickest to lay and permanently weathertight.

No rain or snow, no matter how fine, can sift in under an **"Eastlake" Steel Shingle**. There is a full three-inch lap, and the counter-sunk cleat holds the bottom of the shingle as tight as though welded in place.

The bold **"Eastlake"** Pattern is so deeply embossed that only the very best Steel will stand it.

Let us send you our illustrated booklet, **"Eastlake Metallic Shingles."** *Write to-day---just your name and address on a post card,*

We also manufacture Corrugated Iron, House and Barn Siding, Metallic Ceilings, Eavetrough, Cornices, Conductor Pipe, Ventilators, etc.

BRANCH FACTORY: WINNIPEG AGENTS IN PRINCIPAL CITIES

A Hint for Hand-Sewing

I have discovered an easy way to make hand-run tucks in lingerie. Crease the first tuck as usual for machine tucking and gdjust the tucker, but do not thread the machine. Then run the material through the tucker. The needle will leave a distinct line throdgh which to run your hand-sewing. The machine also leaves a ,ine for the next tuck.

It is best to sew each tuck as it comes from the tucker as handling obliterates the marks. By this method tucking may be done more accurately and in less than half the usual time.

To insert lace or insertion, first baste the material to be trimmed, ob stiff paper, then apply the lace to it and sew by hand or machine. To form yokes or cuffs, cut the desired pattern in stiff paper, baste on the insertion and, holding it flat, sew it on the machine. One edge of the lace should be lapped over the other. The machine gives a better finish, is firmer, and is much more quickly accomp,ished.—H. M. J., Massachusetts.

Her First Cake.

She measured out the butter with a
very solemn air;
The milk and sugar also; and she
took the greatest care
To count the eggs correctly and to
add a little bit
Of baking powder, which you know,
beginners oft omit.
Then she stirred it all together and
she baked it full an hour—
But she never quite forgave herself
for leaving out the flour!

—E. L. Sylvester.

Roast Goose.

The flesh of the goose is very sweet and tender, and is very readily digested. To be good the fowls should be young and in prime condition. They are said to be best at from four to six months old. A goose should be killed at least twenty-four hours before cooking. After plucking and dressing, cut the neck close to the back, leaving the skin long enough to turn over the back. The breast bone should be flattened with a rolling-pin, the legs and wings securely skewered. A young goose will require an hour and an half to cook. It should be basted frequently. Watercress is a pretty garnish for a goose, which should be served with brown gravy and apple sauce. Some cooks send it to the table with both onion and apple sauce. To roast a goose, stuff with a dressing made of four large chopped onions, a tablespoonful of minced sage, a pint of stale breadcrumbs, 2 oz. of butter, one beaten egg, with salt and pepper. After filling the body, sprinkle well with salt and pepper. Put in a dripping-pan, dredge with flour, add a cupful of water to the pan, set in the oven, and let bake ten minutes for every pound. Baste every fifteen minutes. Serve with its own gravy and apple sauce.

Glazed Apples With Cream.

For a dozen large apples, use a cupful of sugar and a cupful and a half of water. Put one cupful of the sugar in a saucepan with the water, and boil rapidly for twenty minutes. Pare and core the apples, keeping them whole. Put them in deep earthen plates, and put a teaspoonful of sugar in the centre of each apple. Baste the outside of each apple with about half a teaspoonful of the hot syrup. Place the pans in a moderately hot oven, and bake the fruit until it is tender, basting frequently with the syrup. When the apples are done place them on a flat dish, and pour over them the juice from the pan on which they were baked. Serve cold with a bowl of whipped cream.

Baked Cabbage.

Select a solid, white head of cabbage, cut off a small portion of the top, and take out the middle, leaving enough of the outside leaves to stand like a cup. Put the whole in salt water and let it stand from two to three hours. Then chop fine a part of the cabbage you have taken from the inside, and mix with it cooked rice and cold roast beef, cut into small pieces, or oysters. Season with butter, salt and pepper, and an onion. Put this filling back into the head you cut it from, and tie in the top securely. Bake in a pan with but little water to keep from burning. Cook slowly half an hour.

Mutton Soup.

Take a sheep's neck, wipe with a damp towel, put into a soup-kettle with four quarts of cold water, bring slowly to a boil; skim carefully, cover and let simmer gently for three hours. Take up, strain, return to the kettle with one sliced onion, one large, sliced turnip, a bunch of sweet herbs, and half a cupful of rice. Let simmer an hour longer, season with salt and pepper, and serve.

Haricot Savoury.

Stewed beans (for two).—Four ounces haricot beans, steep them over night in cold water; place in a saucepan with a small-chopped onion; cook two or three hours. Half-an-hour before serving, add salt and pepper and a pinch of sage, marjoram, or parsley, and serve.

INVINCIBLE
INVINCIBLE FENCING
2
Canadian Made - Canadian Quality
Why should Canadians buy fences made from imported Bessemer "close-wiped" galvanized wire with the thinnest possible coating? Wire "skimped" to swell the sellers' dividends. Witness the rusty dilapidated fences everywhere. Canada for years has been a dumping ground, and fence-factories are still turning this "skimped," imported Bessemer wire into fencing which will come very dear to the user.
The interests of The Steel Company of Canada and those of the Canadian farmer are mutual. On the permanent good will and welfare of the Canadian consumer the Steel Company of Canada places the highest value. Invincible Fencing, made of the finest steel heavily galvanized, and woven by men of long experience, merits the Trade of Canadian Farmers.
It is Canadian made and Canadian quality. Of the finest open hearth steel and honest, heavy galvanizing. The Invincible lock has the grip and tenacity of the British Bulldog.
Invincible Hot Galvanized Gates are a wonderful improvement. They are zinc-clad, rust-proof and indestructible, good for a lifetime, yet cost about the same.
Agents should get promptly in line with the biggest Canadian steel producing company and the most desirable and paying line in the Dominion. Write for agency proposition.
THE STEEL COMPANY OF CANADA, LIMITED
THE FENCE DEPARTMENT, BOX 31 MONTREAL, CANADA.

"Don'ts" for Mothers.

Don't say, "Oh, do be quiet," or "Do sit still!" Remember that bones and muscles must develop. Make a place for them to do so. This is your duty.

Don't permit a fear to be implanted in your child.

Don't forget that "What?" and "Why?" are the best manifestations of a normal brain. Take time and pains to make it grow wisely.

Don't take your small child shopping.

Don't fai, to give the reason why every time you give a command. You want the obedience of an intelligent, reasoning being, not that of an automaton.

Don't forget that the mother who can enter into all her children's pleasures has discovered a marvellous "youth restorer."

Don't bring up your children upan a steady diet of "Don'ts," miserable, pricky little word that it is, and sure to rub the wrong way.

Don't correct your child in the presence of others. You yourself would find this very hard to brook, so why regard this little being as less sensitive?

Don't overlook an untruth, yet weigh carefully between untruthfulness and a vivid imagination. It is often a hair-splitting task, but no mistakes should be made.

Don't fail to listen attentively and patiently to all the little trials which come into the lives of these small people. Help adjust them, and remember that at six they are as great in proportion as those which daily come into your own life.

Don't offer bribes as an inducement to good behaviour.

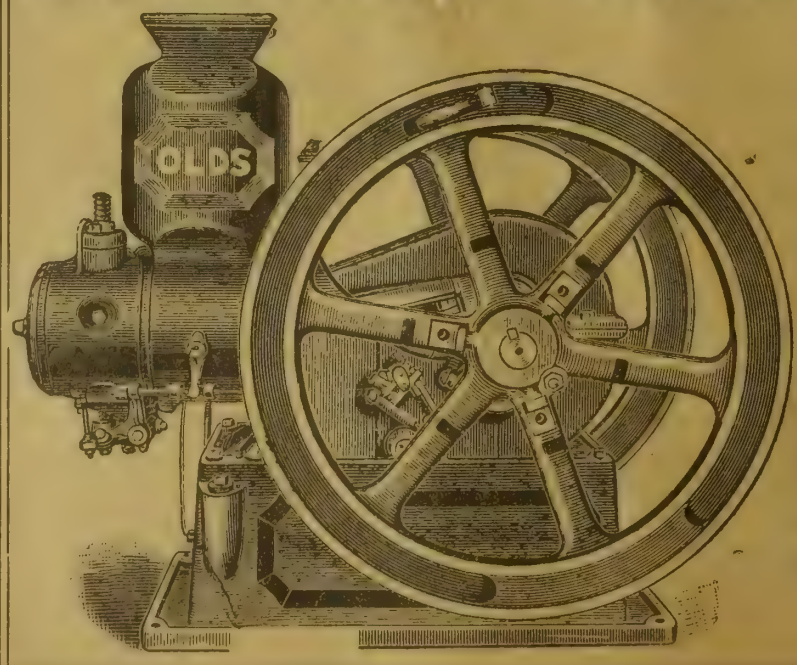
Don't fail to insist, while your children are still schoolboys and schoolgirls, upon orderly habits in the home, and certain hours for certain duties. As a result of this method the good housewife and thoughtful husband may bloom forth later.

Don't fail to make your smile your children's ,ast memory as they depart for school. A ruffled spirit as a send-off puts the time out of joint for the entire day.

Rice Fritters.

Put into a small stewpan one pint of new milk with 6 oz. of rice, 3 oz. of sugar, the peel of a lemon grated, 2 oz. of butter and a very little cinnamon. Boil all slowly until the rice has absorbed the moisture. Mix in the yolks of three eggs well beaten, and, when all is cool, make the rice into balls, placing in the centre of each some orange marmalade. Brush them over with the yolk of an egg, sprinkle with breadcrumbs, put them in a wire basket, and fry them in boiling fat a light brown. Drain, and serve in a napkin with sugar sifted over them.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Eye Facts.

Editor Maritime Farmer:—

One of the most, if not the most, important subject that confronts humanity to-day from a physiological standpoint is that of defective eyes, and how this defect can be remedied by the skilled optometrist with optical appliances.

Possibly there is no branch of any trade or profession more liable to be made a mystery of by unqualified persons than the adaptation of glasses.

It cannot be too strongly impressed upon the public, that to correct the various errors of refraction requires a great deal of skill and intelligence, knowledge of the anatomy of the eye, the effect of different lenses and combinations of lenses thereon, and the ability to correctly diagnose the various defects, both structural and functional, which is only obtained by years of study and experience in dealing with impaired or defective eyes; at the same time there is no mystery whatever about it. There are certainly well defined principles recognized which must never be lost sight of.

The subject of eye strain is one of great importance. I have, after careful observation, become convinced that this greatly prevailing complaint may be the chief cause and not the result of obscure diseases.

I should like to briefly demonstrate the relation eye-strain bears to many nervous diseases and derangements.

Before proceeding, however, it will be necessary to take a cursory glance at the eye and its functions, for the better understanding of those not acquainted with the physiology of the eye—not, however, from an anatomical point, as that would necessitate too much unnecessary detail.

The eye may be likened to an ordinary camera, in which the retina is represented by the screen or sensitibe plate, the choroid by the dark background, the crystaline lens, the aqeous and vitreous humors by the refracting media. The iris is illustrated by the diaphragm, which shuts off the peripheral rays that would otherwise traverse the lens and give rise to what is termed "aberration."

The sliding tube of the camera for focusing objects at various distances, is in the eye the ciliary muscle. The focusing of the images of distant or near objects upon the retina is effected by a change in the convexity of the lens so as to form on the retina a distinct image of an object miles away or only a few inches away.

It will now be seen that an eye that departs from the standard, or is abnormal in anyway, must be more or less at a disadvantage.

If the eyes of an individual do not possess sufficient refractive power it is obvious that he must "accommodate" more or less to increase the convexity of the lens. This necessitates a continuous strain on the ciliary muscle, which, though perhaps scarcely perceptible for a time, sooner or later makes itself felt.

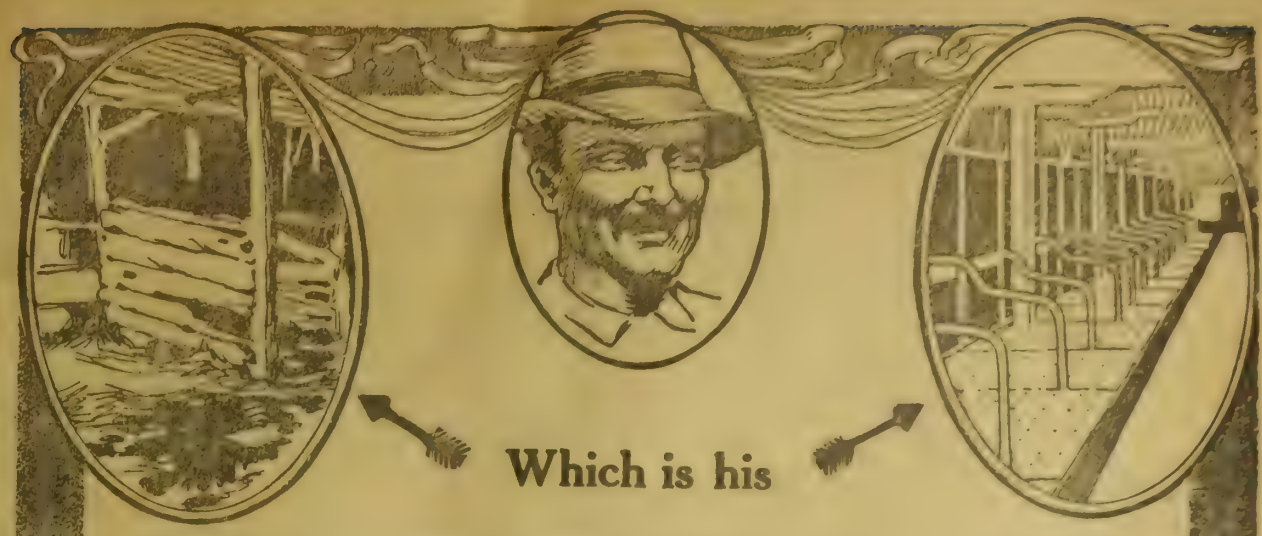
Many suffer from headache and nervousness that do not suspect the cause. The nerves that control the eye have a direct connection with the most vital parts of the human system. Continual strain on these nerves keeps them in such a weakened condition that they have to call on the force of other nerves to keep them supplied. In that way the strain is carried to all the nerves, and will, in time exhaust them all.

The "hypermetrope" then complains of pain in the region of the eye, sometimes in the centre or back part of the eye ball, but more frequently through the temple and over the brow. Occasionally the pain is felt in the back part of the head, and it may be accompanied by nausea and vomitting.

As a rule, the patient will complain that he is unable to use his eyes for long without weariness, drooping of the lids, and an inclination to close them; if he persists in his work for a lengthened time the pain becomes severe, the pages of a book blur, and the letters become indistinct and run together. By resting the eyes and relieving them of the strain, by relaxing the accommodating ciliary muscle, the work may be proceeded with for a time, but it finally has to be dropped altogether to obtain relief.

Suitable lenses placed before the eyes of such a person at once make up the deficiency that exists, and relieve the accommodation and hence the strain.

Another very important function closely associated with accommodation is that of convergence.



Which is his

THERE'S no mistaking the expression of a man whose farm is well "improved." He *looks* as prosperous as he *feels*.

It isn't the size of a place that counts most, nor its actual dollars-and-cents value. It's rather that "well-kept," thrifty appearance; the appearance that makes you think of fat stock, and well-filled barns, and comfortable, contented living.

Neat, permanent improvements go further in giving a farm this appearance than any other feature.

Concrete Is The Ideal Material

for such improvements. It is neat, harmonizing with its surroundings in the country. Everlasting, it cannot be injured by fire, frost, wind or lightning. Age—instead of causing it to decay—actually makes it stronger.

Concrete never needs repair—first cost is last cost. New improvements can be added year after year with less expense than would be required to keep wooden structures in repair.

Concrete walks, feeding floors, dairy-barns, ice-houses, root-cellars, well-curbing, fence posts, silos—which of these does your farm need most? Whatever you want to build, it's best to build it of concrete.

Do you want to know more about this subject of permanent farm improvements? Then write for your copy of

"What The Farmer Can Do With Concrete."

It's a book of 160 pages, telling how other farmers have used the "handy material" to good advantage. Published to sell at 50c. a copy, it is now being offered free to all farmers who write for it. Address

Canada Cement Co., Ltd., 22-32 National Bank Building, Montreal.

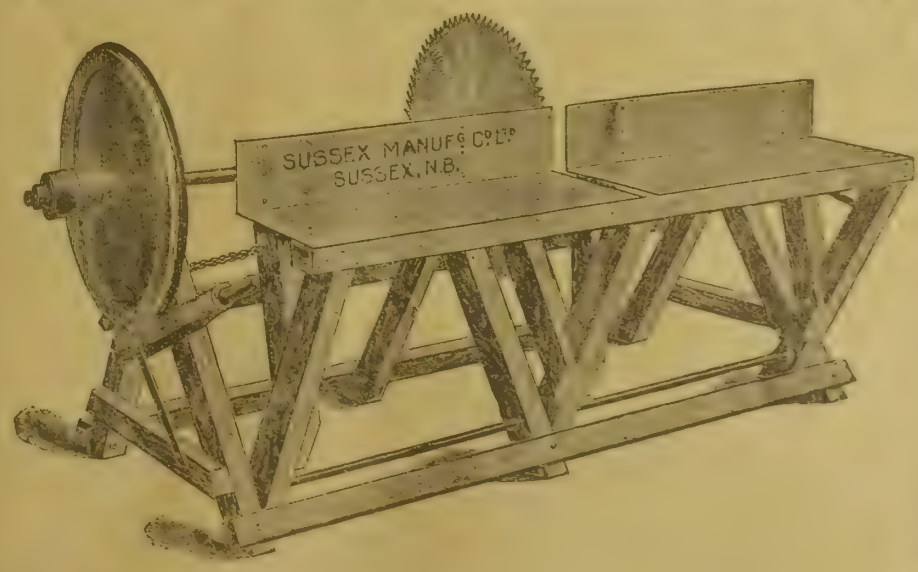
Wood Cutters Made in Three Sizes.



We make the best Wood Cutter on the market. The length of table on our Long Swing is 8 feet, 3 inches; distance between balance wheel and saw 4 feet, 3 inches. Heavy substantial frame and well braced. Steel plate table.

Length of table on Flat Rolling Machine is 8 feet, 3 inches; distance between balance wheel and saw 4 feet 3 inches. The table of this machine moves on grooved rollers and vd. track, which holds the table in position, making it move very easily to and from the saw.

Our Short Swing is built on the same principles as the Long Swing, the arbor and frame is shorter; length of frame 4 feet, 3 inches; distance between balance wheel and saw 3 feet, 6 inches.

On all our machines the arbor is the same size, made of the best turned steel and runs in bearings of the best babbitt. The balance wheel is a solid web and weighs 180 pounds.

We have a large number in stock and can ship promptly. All enquiries will have prompt attention.

BACK WAS SO LAME

LIFE WAS A BURDEN FOR TWO YEARS.

Mrs. Joseph Throop, Upper Point de Bute, N.B., writes:—"I cannot speak too well of Doan's Kidney Pills. For two years I was so tired life was a burden and I got up more tired than when I went to bed, and my back was so lame I could hardly straighten up. I took different kinds of medicine, but none of them did me any good until a friend advised me to try Doan's Kidney Pills. I did so, and to-day I don't know what it is to be tired, and my lame back is all gone. I can recommend them to any person suffering with lame back, and that terrible tired feeling."

Doan's Kidney Pills are a purely vegetable medicine, realizing quick, permanent relief, without any ill after effects.

Doan's Kidney Pills are 50 cents per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price, by The T. Milburn Co., Limited, Toronto, Ont.

If ordering direct specify "Doan's."

Fertilizer Requirements of the Potato.

Extract from

"The Potato Crop in Canada"

By

B. Leslie Emslie, C.D.A., P.A.S.I., F.C.S.

"The elements of fertility, of which a soil becomes depleted in the ordinary process of cropping, are Nitrogen, Phosphoric Acid and Potash, and every pound of produce sold off the farm removes a certain amount of these substances, so that if the fertility of the soil is to be maintained, these essential elements must be returned in some form. This can be accomplished by applications of artificial fertilizers, either as substitutes for or supplements to barnyard manure.

It has been shown by repeated analyses that a crop of 300 bushels of potato tubers removes from the soil approximately 60 lbs. of nitrogen, 30 lbs. of phosphoric acid and 105 lbs. of potash. A preceding crop of clover ploughed under, would furnish the necessary nitrogen; clover being peculiarly endowed with the power of assimilating atmospheric nitrogen, enriches the soil in that expensive ingredient. 300 lbs. of Acid Phosphate would provide all the phosphoric acid and 210 lbs. of Sulphate of Potash all the potash required. If we allow for a small supply of these substances, available from the soil's supply, smaller quantities might suffice, but then, remember, that for a crop larger than 300 bushels the extra requirements would be in proportion to the increase in yield over that amount." Copies of this and other important bulletins, treating of this important subject may be had by applying to

GERMAN POTASH SYNDICATE,

Children are much more likely to contract the contagious diseases when they have colds. Whooping cough, diphtheria, scarlet fever and consumption are diseases that are often contracted when the child has a cold. That is why all medical authorities say beware of colds. For the quick cure of colds you will find nothing better than Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all Dealers.

If an excessive amount of accommodation is required the extrinsic ocular muscles must suffer as well as the ciliary; the external rectus is usually the affected muscle, this becoming weak, permits its ooposing muscle, the internal rectus, to draw the eye in towards the nose. This condition is termed "esophoria" and is usually the result of uncorrected hypermetropia.

Then there is the myopic or near sighted eye. In this case the refraction is too great. The eye being adjusted for near objects only, there is no occasion to use the accommodation and consequently convergence must suffer, the internal rectus giving way to its antagonist which in time, draws the eye outward from the nose. The myopic, therefore, sees near objects clearly, while distant vision is very imperfect. Suitable lenses placed before such an eye sends the focus back on the retina where it belongs, thereby enabling it to see the world in a new light and opening up to the beholder beauties of nature never before enjoyed. The uncorrected myope complains of pain, fatigue and intolerance of light, due generally to the muscular strain.

Speaking of muscular strain it might be remarked that it often exists when the eye is perfect,y normal with regard to its refraction power. This constant strain on the ocular muscles brings on the dreaded sick headache. Life becomes a burden, and despondency, melancholia, etc., may follow.

Another refractional error which claims a great deal of attention is astigmatism, the most common form of which is due to an irregular curvature of the cornea. Rays of light emanating from a point do not focus at a point on the retina of an astigmatic person.

In order to gain a clearer and more distinct impression of an object, such a person will sometimes hold the head to one side, and there is a constant effort to try to see distinctly.

These anomalies may exist unknown to the patient, without the symptoms enumerated.

It is therefore evident that the most careful and searching examination should be made by means of the various improved methods now known to the optical profession for errors in the refraction of the eye and lack of muscular adjustment.

In cases where the error is so small as to be quite unnoticeable by the patient, vision being good and none of the unpleasant symptoms connected with the greater defects, sight can to a very great extent be preserved by proper glasses.

"Old sight" or presbyopia is due to a hardening of the crystaline lens which renders it less susceptible to the action of the accommodative muscle.

This is a physiological or natural change which all eyes undergo and is caused by increased age.

When one feels it necessary to hold reading matter at a greater distance than fourteen inches from the eyes it indicates that the tiny ciliary muscle, which has been hard at work for years, is now unable to perform the task assigned it. At this stage relief should be sought in suitable lenses it being very poor policy to over tax this faithful servant.

In view of the foregoing facts, and the various statistics that come to hand, it is safe to assume that eye strain with its accompanying functional incapacities, must be largely on the increase, and it should therefore be one of the first duties of parents to have the eyes of their children carefully examined by an expert.—H. V. Harris, Optometrist. Margaretville, N. S.

Any Man May Easily Regain LOST VITALITY

Strong vigorous vitality, the crowning glory of mature, healthy manhood.

Do you know, reader, what this means to you?

If by these few simple inspired words (which every man may with profit read)

I should be the means of pointing out to you or other men the straight and sure, if narrow road to new manhood, new powers, new capacities for a better and more glorious physical and vital development, then in doing this I have rendered a great and lasting service to my fellow beings, and one which is infinite in its power for good

This self-same VITALITY, this builder of manhood and manly vigor, may easily be regained, and I will tell you how.

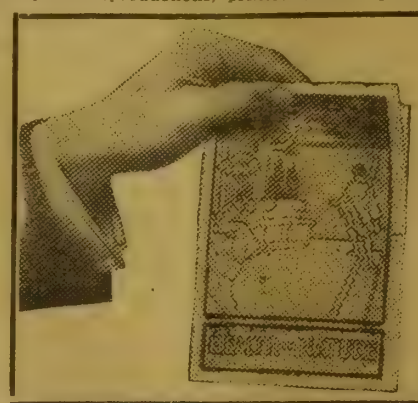
Have you ever stopped to consider that it is this VITAL FORCE which makes rugged men the real men that they are? It is this same MAN FORCE which is behind every great achievement in the world to-day, which gives the flower of our army and navy the courage to meet and face death unflinchingly, which gives the rough and rugged man of the plains that compelling power to rescue at all odds a loved one from some great peril, as our illustration here portrays, and it is this self-same, identical VITAL VIGOR which I must impart to you, reader, if you are not the man you should be.

Therefore, if I give you new vitality, I make you young again, and keep you feeling young the balance of your days. By increasing your vital supply, I soon have you answering "Simply feeling fine" to your friends' morning greetings, while they in their turn will secretly marvel at the wonderous change for the better which has come over you. A thoroughly vital, manly man is the greatest inspiration in the world; his power and fascination are felt by all women and all men alike who are near him. Nothing but death can conquer the giant of strength and manly vigor. On the other hand, how different with the half-man, the neurasthenic degenerate, who is burning up his vitality in dissipation and excesses! Is there any sight more pitiable, more repellent to one's sense of decency, then the weakling who deliberately kills his manhood and self-respect by acts of willful debauchery? Such a man has neither my sympathy nor can he profit by what of wisdom I can impart. But any man who is willing to make a fair, square fight for the return of his lost vitality and lost manhood, who will promise faithfully and honestly to discontinue any debasing practices or excesses he may be indulging, who will help me thus by helping himself to such, no matter how despondent he may be, no matter how weak and debilitated, no matter what years of folly have passed, to such a man I can offer all the encouragement in the world. Just lead a decent man's life, my friend, and then increase your VITALITY. All else will come.

I make and distribute a vitalizing appliance which I call a HEALTH BELT. I do not want you to get one of there HEALTH BELTS now nor to-morrow nor next week, for that matter, but first wish you to write for or call and get one of my little free books. I want you to thus have my whole story of this subject of VITALITY, so that you may judge for yourself. My HEALTH BELT, with suspensory attachment, is a complete treatment in itself; that is you place it comfortably around your waist nights when you go to bed and wear it at the time when you are asleep. The vitality which it produces and sends into your system hour after hour is felt as it flows in. There is no shock, but merely a pleasant, warm, soothing sensation which induces a sound, refreshing sleep. Weak back often disappears at once, and a better feeling is immediately experienced. Two or three months' wear is usually sufficient. The cost is nominal. With special attachments, my HEALTH BELT is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain, sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing or strong. Write or call to-day. Hours 9 to 6.



DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

I.C.R. Has Had Record Winter in Passenger and Freight Business.

Montreal, Feb. 26th—"We are above the high-water mark in everything," said Mr. E. Tiffin, of the Intercolonial Board of Control, which has been holding sessions here. "The winter has been a record one for both passengers and freight business."

Which Shall it be Prodigal, Stranger or the Dutiful Son.

(Continued from page 377).

hands of the money lenders and machinery men. Some have gone that way already and more will follow.

I want to call the attention of the fathers on the farm to one part of the prodigal's story. The elder boy said to his father: "You have never given me a kid during all these long years so that I could entertain my friends." Oh! son, you are always with me and when I die you will have it all, was the father's reply. That's all very well, but, a boy does not want to be a baby as long as his father lives—and those old fellows lived a long time in those days. You see the boy felt sore about it—we know by his remark. So do our boys feel under similar circumstances. It is not much wonder that boys treated in the same way leave the farm. Give your son something that is his own as soon as possible and you will have a chance to watch how he handles it and you will also have an opportunity to direct him. Take proper care of the boys while you have them and you will not have the trouble and expense of dragging them back out of the slums.

I was talking to a boy, eighteen years old, last week. He has one little sister but no brothers. He told me that he had to work in the woods all day and in the barn till nine o'clock at night. His father seldom speaks to him and he never sees any friends or boy or girl chums.

Is that not enough to drive a boy out? His eyes filled to overflowing, as he related his story. I told him to stick to the farm and I would talk to his father and try and better his condition.—D. Macdougall, Westmorland Co., N. B.

Characteristics of the Guernsey.

Editor Maritime Farmer:—

In a previous article a short account of the early history, development, and distribution of the Guernseys was given and this shall deal chiefly with the general characteristics of the breed.

In size they are much larger than the other Channel Island breed, the Jersey, also a more rugged looking animal with more bone, a stronger constitution and lacking a little of the smoothness of that breed. The average weight of a mature cow is around 1100 pounds while a bull should not be under 1500 pounds, and many are much heavier. In general conformation the cows strongly illustrate the dairy type, having a strong constitution and large storage capacity for both food and milk. The head is somewhat long but not unduly so, neat, well chiseled, with a face slightly dished but refined in every point, and topped, in cows, with neat white or amber colored incurving and upcurving horns; while in bulls the horn is somewhat shorter and stouter with less curve. The eye is large and bright, muzzle strong, of a buff or flesh color and encircled with a white or yellowish circle of hair and a similar circle usually surrounds the eye. The head is neatly joined to a trim neck which blends into a strong sharp shoulder and this into a deep, chest and large roomy barrel. The back is large and straight with the vertebrae well apart. In the hind quarters we have a lack of fleshiness, strong hips, good length between hock and pin bones and thin and incurving thighs. The milk secreting apparatus is characteristic, the udder large with good fore-udder and attached high up in the rear. The teats are of excellent size, but not excessively large, and pendulous and cut up udders are not common. The prevailing color is usually a shade of fawn with attractive

SHERWIN-WILLIAMS PAINTS & VARNISHES

Resist wear and tear

For over 40 years Sherwin-Williams Paint has been made with the definite purpose of giving the user the greatest wearing value of any paint, either hand-mixed, or machine-made. Don't be tempted into buying a cheap prepared paint because of its low cost per gallon—buy paint for what it will do. Use the paint that covers most surface and lasts longest —use SWP. 64

Replenishing The Soil.

In the ordinary process of cropping the soil becomes depleted of certain essential Plant Foods, and unless means are taken to restore these, the soil will become wholly unproductive.

Fortunately the progressive farmer is now turning his attention to the use of fertilizers, which will build up and maintain the fertility of the soil.

During recent years a number of educative, illustrated Bulletins on the use of fertilizers in Canada have been prepared by agricultural experts. Amongst these are :

"Artificial Fertilizers ; Their Nature and Use."
"The Potato Crop in Canada."
"Fertilizing Orchard and Garden."
"Fertilizing Fodder Crops."
"Farmer's Companion," etc., etc.

FREE copies of these, as well as special expert advice may be obtained from

THE GERMAM POTASH SYNDICATE

TORONTO, ∴ ∴ ∴ ONT.

and neat white markings, usually a small triangular spot on the forehead, switch, legs, and under part of the body; white may, however, be found on any part of the body. In the color of the skin we have a deeper and richer one than in any other breed and the secretions in the ear and other places also possess this characteristic. In disposition no dairy breed equals or surpasses them as the bulls are quiet and easily handled and the cows are very mild tempered, while the young exhibit the same disposition and readily become accustomed to any change; in all cases, however, you find an active nervous system.

The breed has been developed for its butter qualities and it is here that its chief value lies for the fat globules in the milk are the largest and most highly colored of those of any breed and butter made from the cream possesses the latter characteristic to a very marked degree and it has won highest honors wherever it has been shown. The quantity of milk is large and the test very high and there are authentic records of cows producing over 18,000 pounds of milk and 1,000 pounds of butter in the yearly test while weekly butter ones of over 28 pounds are not unusual.

The Guernsey is an excellent animal to improve the common herd and by the judicious use of pure bred sires a great improvement is seen, even in the first year, in the quantity and quality of the product of the herd; by continuing this practise this can be greatly increased but attempts should not be made here, any more than with any other breed, to cross one pure one with another, and if one breed is kept on the farm stick to it or change entirely.

The farmer in the Maritime provinces, who is looking for a sire to improve the quantity and quality of the milk he produces, can do no better than use the Guernsey, and as good sires are available at reasonable prices there is no reason why a farmer should look around for anything that will prove a more profitable investment.

The increasing demand for young and old stock of both sexes during the past few years shows that the Guernseys are rapidly coming into their own and there is an exceedingly bright future ahead of them in our dairy districts in Canada.—D. G. McKay, President Canadian Guernsey Cattle Association, Heath Bell, N. S.

Development of Newfoundland's Resources.

Newfoundland with its innumerable splendid harbours, its creeks and coves teeming with fish, make it an admirable home for a fishing people. But its wealth is not confined to the fisheries, and while not claiming to be regarded as possessing unequalled timber resources, its wealth in this respect remains undisputed, and contributes largely to the volume of the colony's exports. The demand for native timber for local requirements is also increasing with each year. Authorities state that the lumbering industry together with that of the pulp and paper industries are worth to the colony about $2,000,000 per annum, being an increase of about 1,800,000 over that of ten years ago. It is also claimed that the mineral wealth of the colony is extensive, although somewhat varied, deposits of copper, iron, gold, silver, lead, antimony, talc and asbestos having been discovered. In this respect, however, the iron mines at Bell island form the chief mineral production of the colony. The value of mineral iron exported during the year 1911 is placed at $1,292,700, an increase over that of the preceding year of $126,835.

The total trade between Newfoundland and Canada for the year ending June 30, 1911, exceeds that of the previous year by $458,919, and the United Kingdom, $339,035, while trade with the United States increased by $673,135. The value of machinery exported by Canada totals $192,304, and that of the United States, $194,796. Canada exported for branch railways goods to the value of only $21,803, while the United States exports for the same purpose total $513,289, which accounts for the excess of imports from the latter country over that of Canada. In railway supplies Canada for some reason does not seem to be in a position to compete with her neighbour to the south.

In view of the fact that Canada enjoys the advantage of proximity, and that transportation to and from the two countries is covered in a short space of time, and as there is really no great loss in time in orders and shipments reaching their respective destinations, one naturally wonders why trade relations have not increased to far greater proportions than we find during the past ten years. Up to the present Canada seems to be quite satisfied with her Newfoundland business in flour, oatmeal, country produce, &c., and has apparently lost sight of the trade awaiting development in dry goods, haberdashery, canned meats and fruits, articles of Canadian manufacture so seldom seen on this market, that one is almost forced to the conclusion that the value of the Newfoundland market is not seriously considered by the Canadian manufacturer. This is to be deplored since Canada is in a position to offer the same lines as the United States at possibly an even price, and certainly can make quicker delivery to the Newfoundland buyer. Were Canadian manufacturers to make a study of the possibilities of this field, send capable representatives to open up the ground, command repeats by quality of commodity, correct representation and a true grasp of the system and requirements of the trade of the country, there is no reason why they cannot meet with the same success as the manufacture of heavy winter underwear, winter caps, rubber goods, &c.

Several complaints reached this office regarding the unsatisfactory methods used by certain Canadian shippers of grain. One dealer stated

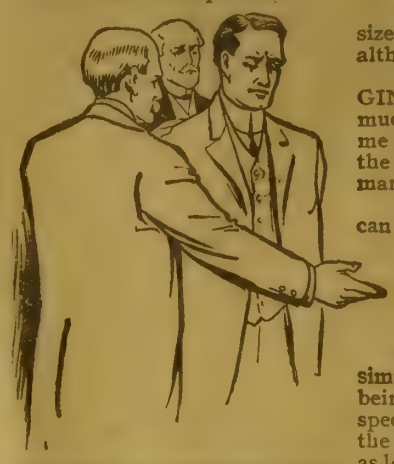
DOCTORS AFRAID TO OPERATE

Could Not Remove Stone From The Bladder. Gin Pills Enabled Him To Pass It.

JOLIETTE, P. Q.

"During August last, I went to Montreal to consult a specialist as I had been suffering terribly with Stone In The Bladder. He decided on an operation and was assisted by another doctor. They said the calculus was larger than a bean and too hard to crush, and that they could not take it out.

I returned home suffering greatly, and did not know what to do, but was recommended by a friend to try GIN PILLS. I bought a box and found relief from the pain at once. I took a second and third box of GIN PILLS after which I went back to the specialist.



THEY COULD DO NOTHING FOR HIM

He told me the calculus was reduced in size, still he could not relieve me of it, although he tried for two and a half hours.

I returned home and continued to take GIN PILLS as they reduced the pain very much, but I did not expect they would relieve me of the stone, but to my great joy, I passed the stone on October 3rd, and am now a well man and very happy.

I am sending the stone to you so that you can see for yourself what a great work GIN PILLS did for me. GIN PILLS are the best medicine in the world and because they did so much for me, I will recommend them all the rest of my life".

J. ALBERT LESSARD.

Isn't it wonderful? Just think of these simple pills, that even children can take, being able to perform what the greatest specialists in Canada could not do. Surely, the days of the miracle have not passed away, as long as we have Gin Pills. These wonderful pills dissolve stone in the bladder or kidneys because they are a natural solvent for uric acid, which causes calculus. If GIN PILLS are not sold in your neighborhood, send us 50c. for a box or $2.50 for 6 boxes. Sample free if you write us mentioning this paper. National Drug and Chemical Co. of Canada Limited, Dept. M F Toronto.

MANGA-TONE BLOOD AND NERVE TABLETS are especially for women and girls to make them well and strong and rosy. 50c. box. 113

that in a single shipment no less than twelve different marks were used, while sacks containing the grain weighed 133, 136 and 150 lbs. each. Such a lack of uniformity in the weight of sacks necessitates more storage room than is ordinarily required, and causes much annoyance to steamship agents and importers. White oats in this market are worth three cents per bushel less than black. New bags of uniform size containing 152 lbs. (including bag) should, invariably be used.

The initials of the importer, exact weight, the kind of grain, should be plainly exhibited on each bag, thus:—

'A.B.'—(Name of importer).

'4 B.'—4 bushel of black oats.

or,

'4 W.'—4 bushel white oats, as the case may be.

If these instructions are closely followed no further complaints will reach us from the Newfoundland traders.—W. B. Nicholson, Trade Commissioner, St. John's, Newfoundland.

Canadian Cream for the U. S.

J. B. K., Kings Co., N. B.:—Will you please give me an idea of the extent of the Canadian cream trade with the United States?

During the year ending March 31, 1911 Canada supplied the United States with 1,823,821 gallons of cream. Figured on the basis of four pounds of butter to the gallon, the year's shipments were equivalent to about 7,300,000 pounds of butter. Much of this cream was used in the manufacture of ice cream or was consumed as cream in the cities, but in these channels it supplanted approximately an equal quantity of American cream and thus that increased by that equivalent the proportion of U. S. milk flow going into butter and cheese. Under the Payne-Aldrich tariff schedule Canadian cream enters the United States under a duty of five cents a gallon which means a duty of less than 1½ cents per pound of butter-fat in very rich cream.

Farm Laborers for Nova Scotia.

Staff-Captain Jennings has just returned to Halifax after spending three months in the "Old Land," during which time he travelled extensively through Scotland, England and Ireland, lecturing on Nova Scotia, its resources and opportunities. These lectures were largely attended and created considerable interest in this Province. The Staff-Captain succeeded (through the lectures and personal interviews) in interesting a large number of Farmers and Farm-laborers, who will come to Nova Scotia this Spring. Some of these men have a small capital, ranging from 150 to 500 Pounds. The men will arrive a few at the time on the various boats, during March and April, and will be given situations on arrival.

A number of applications have already been received, but if there are any others who will need help this Spring, they should write at once to Staff-Captain A. Jennings, Box 477, Halifax, N. S.

Conirol of Coddling Moth.

In the laboratory fungicidal tests on spare germination with summer spores (conidia) of the apple scab fungus were made. Lime-Sulphur alone diluted 1-50 reduced germination from 50 per cent. to 12.5 per cent., while with 1-100 and Lead Arsenate added at the rate of two pounds to 50 gallons it was reduced from 66 to 0 per cent.

On the trees apple scab was reduced from 79.4 per cent. to 29.5 per cent. by Lime-Sulphur 1-30 alone, and to 10.9 per cent. by the same concentration of Lime-Sulphur with Lead Arsenate added.—Cornell Bulletin 284.

Why Ventilate the Dairy Barn ?

One of the great causes of disease in animals is unfavorable external conditions, for no living thing can thrive unless the surrounding conditions are favorable for its growth. All animals have a certain capacity of enduring unfavorable influences. This capacity is usually spoken of as "vital resistance." This may be great or small, but every animal must have more or less of it or it cannot continue its struggle for existence.

It was recognized more than a century ago that impure air induces disease. Impure air is not the cause of the disease, but constitutes an unfavorable surrounding condition. The vitiated air of stables reduces the vital resistance of an animal, rendering it less adaptable to the extremes of conditions to which it may be exposed and more susceptible to infection, against which it has no sure defense.

Dairy barns are very frequently poorly ventilated. The dairy cow is then not only required to live, but to work, under unfavorable influences and she often falls a victim to such diseases as tuberculosis, pneumonia, bronchitis, colds, etc. Foul air is one of the prime factors in the production of such diseases.

Since the advent of sanitary science in connection with ventilation the air space allowed for each animal has been increased, and a number of methods of ventilation have been devised. The exercise of a little care in such matters will protect the health of animals, prevent premature death and also make possible the highest working efficiency of the herd.

A Good Start With Clydesdales.

The splendid two year old Clydesdale stallion "Royal Flash"—11840—, by "Flash Favorite" (Imp.) (12147) (4583), out of "Baron's Lily" (Imp.) (17431); bred by the Nova Scotia Agricultural College Farm, has recently been purchased by Mr. Roland Rutherford, of River Hebert, Cumberland Co., N. S. This is a colt of great promise, being of good size, splendid quality, beautifully compact and well muscled body and showing excellent action.

We are pleased to know that Mr. Rutherford, an ex-student of the N. S. A. C., as well as a graduate of the O. A. C., Guelph, has been so fortunate in his selections of pure bred Holsteins and in this, his start in Clydesdales.

Will Advertise Shire Horses.

At the Annual Meeting of the Shire Horse Society in England on February 29th, the Earl of Coventry presiding, a committee was appointed to devise a scheme whereby the suitability of Shire Horses to the requirements of the Canadian and American markets will be made known to those Countries.

"Baron Kelvin" Comes to P. E. I.

Hon. John Richards, Biddeford, P. E. I., has purchased from Graham & Renfrew Co., Bedford Park, Ont. the champion Clydesdale stallion, "Baron Kelvin" at perhaps the highest price ever paid for a stallion in Canada, which shows that the breeders of Prince Edward Island are out for the right kind of stuff.

Harding Bros. Add to Their Herd.

At the Tillsonburg Ontario Holstein sale, which was carried out on January 2nd, Mr. Thos. Harding, of Harding Bros., Welsford, N. B., bought the cows Fairy Faforit and Kate Abbekerk for $215 and $275 respectively.

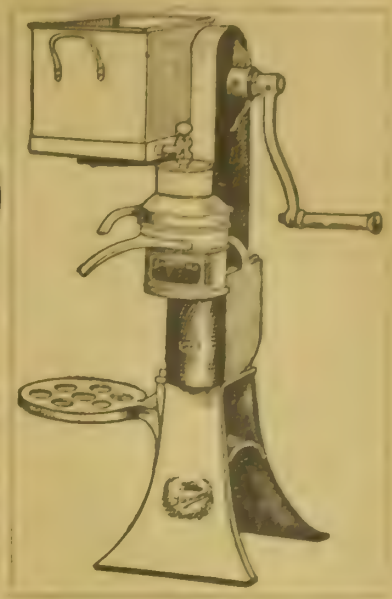
For Your Wife's Sake

Get an easy-running, easily cleaned Separator

A busy farmer cannot always be on hand to turn the separator for his wife. But if the separator is a

STANDARD

his wife will not require the services of a strong, husky man.



The makers of the Standard have built a separator that any woman can easily turn. A strong arm and a strong back are not necessary to make the Standard go. A little energy goes a long way with the Standard.

The low supply can of the Standard also makes it essentially a woman's separator. If given her choice, no woman would prefer to pour a pail of milk into a supply can at least one foot higher than the Standard's. A high supply can means a high and awkward lift, and frequent accidents.

Your wife will prefer the Standard, too, on account of its sanitary features. Milk from any source cannot reach the neck-bearing. Neither can dust get into it. The gearing, too, is enclosed, and is therefore dust-proof. The discs can be cleaned in a minute's time without the use of a brush.

But get the Standard Cream Separator Catalog and learn all about the world's greatest separator--the quiet-running, self-oiling dust-proof separator that will pay for itself in so short a time.

Hamilton, Ont.

The All Canadian Route to Montreal.

Via the Intercolonial Railway Maritime Express is the only All Canadian Route to Quebec and Montreal from the Maritime Provinces. The Maritime Express is generally admitted by experienced travellers to be the most comfortable train in America. This is especially true in regard to the dining and sleeping car service. The diners of the I. C. R. are roomy and well ventilated and furnished in the best of taste. The excellent meals are served Table d'hote at a price away below the a la carte rates prevailing on the company owned lines. The sleeping coaches are up to date in every particular, and the smoothness of the road bed makes the long journey easy and pleasant. Being popular with a class of travellers who are generally found to be the acme of good company the through journey is never found dull, and even during the winter months there is much of scenic interest in the day's ride through the Province of Quebec. Montreal is reached at the convenient hour of 6.30 p.m. and connections are made at Bonaventure Union Station with the through trains of the Grand Trunk Railway for Toronto, Buffalo, Detroit, Chicago, and other points in Western Canada and the United States.

You Can't Take Chances

If you want the Best Seeds that grow, then you want

For twenty years McDonald's Seeds have made money for a host of progressive farmers and gardeners all over Canada; they'll do the same for you. Send for 1912 catalog, FREE.

Selecting the Male Birds.

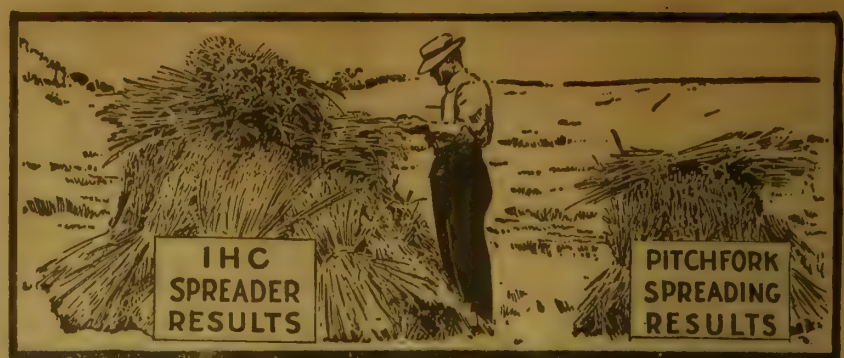
The male that is to head each pen should be selected with great care, as he is half the pen. Above all he should be strong and vigorous, and strong in the points w herein his mates are weak. Where a weak section in one parent is offset by the same sectian being exceptionally strong in the other parent the defect is reproduced only upon a part of the progeny and in a lesser degree than was possessed by the parent (where both parents are equally prepotent breeders), but where both parents have the same defect their progeny will possess the defect greatly magnified. Many breeders are mistaken in thinking they have a vigorous male because he possesses great activity in his attentions to the females. Such a male possesses strong reproductive organs, but not always a strong constitution. The male that possesses a strong constitution is the first off the roost in the morning and the last to go on at night; he is ever scratching and calling to his mates to eat the fruit of his labour; is gallant and never forces his attentions upon his mates. His comb and face are bright red in colour, and does not turn dark red or purple after service or fighting with another male. A male that has a habit of violently shaking his head, at the same time stepping backwards, is suffering from nervousness, and should never be used for breeding. I prefer a male that crows loud, long and often, as it is an indication of vigour and strong respiratory organs.

CARE OF THE BREEDERS.

A good male bird is easily ruined by improper care. If he is as gallant as he should be he will continually scratch and hunt food for his mates to his own detriment, and should be fed once a day from his mates. For this purpose a small coop on the wall of each house is convenient in bad weather, but in mild weather it is more convenient to feed the males outside the house just after the females have gone to roost. After being taken out of the house and fed for several evenings just after the females have gone to roost the males will soon learn to come out and receive their suppers when they hear the attendant coming. A small handful of grain and coarse beef scraps each evening will be sufficient. Should the male appear lazy or out of condition, he should be removed from his mates for a few days to allow him to recuperate and not waste his energy on useless service.

EGG PRODUCTION.

As great egg production can be secured by keeping the birds in close confinement as if given free range, but where fertile eggs are desired the more range that is given the better. Each pen should have a large yard well sodded over and protected from the sun in summer by trees or sunflowers, and from the winds in winter by windbreaks of old boards or straw along the nortn and west sides, so that the fowls will spend as much time as possible in the open air. The houses should be dry and well ventilated, and the floors covered with deep litter, into which the grain may be scattered in bad weather to induce the birds to exercise. In mild weather the fowls will prefer to scratch in the open air if protected from the winds. I like to have a litter pen in each yard in the corner most protected from the wind. Boards high enough to prevent the litter being scratched outside the pen is all that is necessary. The breeding stock should have an abundance of green food at all seasons of the year, and for this purpose nothing is better than sprouted oats where a grass range is unavailable. Some meat food is also necessary for best results, and they should have sufficient grain to keep them in good condition, but never have enough to make them become fat.—American Poultry Journal.



How Do YOU Spread Manure

THE above illustration shows the difference in crops, between the I H C way of spreading manure—and the pitchfork method.

The pitchfork way is slow, hard, and disagreeable, wastes much of the value of the manure, and the results hardly justify the labor and time invested.

The I H C Spreader cuts the manure into fine shreds, spreads it evenly, and makes the work easy. Spreading manure the I H C way is bound to result in better soil, bigger crops, and more profits.

I H C Manure Spreaders

Corn King—Cloverleaf

are simple, strong, and durable. They have many advantages that make them superior to other spreaders.

All working parts are extremely simple and wonderfully strong. The beater driving gear is held in a single casting, so that there is no binding—no cutting of parts caused by the gears springing out of alignment. The roller-bearing support for the apron reduces the draft. The levers are convenient. The feed changing device can be shifted quickly and easily. The wide range of adjustment allows you to spread manure heavy, medium, or light, as your judgment tells you is best for the soil.

Whether you have a large or small farm, or want a spreader for orchard use or truck gardening—there is an I H C that will suit your requirements. Why not see the I H C local agent at once? Get a catalogue from him, or, write nearest branch house.

I H C Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizers, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning these subjects.

"A Call"

To the P. E. I. Central Seed Fair, Domestic Science and Poultry Show to be held in Market Building, Charlottetown

12th, 13th and 14th March

Charlottetown being central and competition being open to the whole Province makes it an ideal place to buy seed grain, potatoes, &c.

When visiting the poultry show you can order your eggs for hatching or get birds for mating. Improvement is the order of the day and you CANNOT AFFORD to lag behind.

The educational meetings held in connection will be helpful and should have large gatherings.

EVERYTHING FREE and EVERYBODY WELCOME.

For prize list and information write

John H. Gill, Secretary,
Little York, P. E. I.

Vigor of Youth.

EVERY MAN CAN HAVE IT.

Youth with all its energy and enthusiasm can be yours. Youth is only health; it is only fresh young manhood. When your blood is warm and your nerves full of energy you have youth and health and all the force that goes with it. The fire of the nerves, dimmed by neglect and misunderstanding of life, can be rekindled and all the sparking vitality of youth restored. You are only as old as self-made worry makes you. You can get back the fire and vim of youth and feel like a young man again. Circulation will do it, and you must use electricity to get that 20,000 have used it and they join in praise of this wonderful remedy.

You may have heard of it, you may of some of its wonderful cures, but still you have been doubtful and afraid to venture. Your hesitation is due to the failure of drugs. That's no argument against electricity. You have paid dearly indeed for the little mite of relief which drugs have brought you, and it was not even permanent relief. My way of applying electricity cures to stay cured. You use it two or three hours every evening or at night at sleep. No bother, no waste of time, nothing but pleasure while treating. Circulation is revived, you feel new life, invigoration, such as only fresh pulsating blood will bring you. If your blood is stale and sluggish, there is a reason and a remedy. It's Electricity, the fire of life.

Back and Kidney Troubles.

Rutherglen, Ont., Dec. 3rd, 1911.

M. F. McLaughlin,—

Dear Sir,—Some time ago, I purchased one of your Belts and after wearing it for thirty days I am pleased to say that I feel like a different man. I am still wearing the Belt and find myself getting stronger every day, and I must say that I would not be without it on any account. With pleasure I wish to recommend it to any person suffering from lame back or kidney trouble.

Yours truly, S. Craig.

Cured of Lame Back in Two Months.

Loch Lomond, R.F.D. No. 4, St. John Co., N.B. January 22, 1912.

M. F. McLaughlin,—

Dear Sir,—I have worn your Belt for two months and it has done all that you claimed it would do, and I am in perfect health now. My back is completely cured. The Belt is as strong as ever, and has more than paid for itself.

Yours very truly, W. H. Smith.

Considerable Relief After Ten Days Use of the Belt.

166 Notre Dame St., Three Rivers, Que., Dec. 18, 1911.

M. F. McLaughlin,—

Dear Sir,—It is now 30 days since I received my Electric Belt from you and I can without the least doubt say, that it has done me a lot of good. On receiving the Belt, I immediately used it according to the instructions enclosed, and had considerable relief even after ten days. I will continue to wear my Belt till perfectly cured.

Yours very truly, Mrs. A. V. Gaudin.

BIG BOOK FREE

This edition of my book is just completed, and it's free to you for the asking. It tells you how a puny man can make himself feel like a Sandow. Of course, it's not going to grow you bigger than nature intended you, but any man who started out with a fair constitution and for some reason got on the decline, can learn something from this book that will open his eyes to how useless it is to be ailing, slow, poky, lacking in vim, ambition and self-confidence.

I want him to read this book and learn the truth about my arguments. If you are not as vigorous as you would like to be, if you have rheumatic pains, weak kidneys, prostatic troubles, nervous spells, varicocele or any ailment of that kind it would assure your future happiness if you would look into this method of mine. Don't delay it; your best days are slipping by. If you want this book. I send it closely sealed free if you inclose this coupon.

How to Build a Dairy Barn.

P. B. Tustin, Associate Royal Sanitary Institute, and Chief of Food and Dairy Division, Health Dept., Winnipeg, Man., says:—

"The Cow Stable is the Kitchen where the food of many city babies is prepared, and it is the duty of every farmer and dairyman to see that the kitchen is clean. Cow stables should be light and well ventilated, fitted with concrete floors and steel stalls which are practically indestructible and are necessary for the following reasons:

"Concrete floors do not soak up manure, which is one of the chief causes of the spread of tuberculosis in cattle. "Steel stanchions and stalls do not obstruct the light, are easily kept clean and do not soak up manure. Stables constructed in this manner are lighter, cleaner and more comfortable for the cattle."

We have just received a book entitled, "How to Build a Dairy Barn" from Beatty Bros., Fergus, Ontario, manufacturers of cow stalls, stanchions, litter carriers, feed carriers, hay carriers, horse-forks and slings, water-bowls, rack clamps and extension ladders.

Any reader of the Maritime Farmer who contemplates making changes in his dairy stables or who is going to build new ones may procure a free copy of this book by writing to Beatty Bros. and mentioning the Maritime Farmer. It contains an excellent article on Ventilating the Cow Barn by J. H. Grisdale, Director of Dominion Experimental Farms. It also shows different systems of equipment and construction that will give the intending builder a model idea towards which he may work. Send for a copy to-day.

Sweetening the Meat Barrel.

Editor Maritime Farmer:—

I notice in your issue of January 30th, your directions for Sweetening the Meat Barrel. It probably is all right but for half a century I have adherred to the theory that fire would purify all things; hence my practice is as follows: No difference whether the barrel smells of tainted meat or fish, fill it with water and let it stand for two days or more. Then empty water out and wash clean. Next take oat straw or hay and put a little in bottom of barrel and set on fire. Drop in more straw as it burns down. Turn barrel on side and roll over slowly not spilling the cinders. Shake it about or stir to burn down and if you char the inside of the barrel all the better. Empty out and wash thoroughly and I will warrant the job complete.—J. T. Hetherington, Queens Co., N. B.

Fertilizer Requirements of Corn.

Extract from

"Fertilizing Fodder Crops"

By T. Walter Shipley.

"Corn is a gross feeder and must have an abundant supply of readily available "plant food" material. Where corn is grown on any but a clover sod or meadow, a dressing of twelve to fifteen tons of barnyard manure should be applied and thoroughly worked into the soil. While this dressing of manure would supply the necessary humus and part of the nitrogen required, it must be supplemented by the addition of phosphoric acid and potash if a maximum crop is to be grown. The addition of, say, 400 lbs. Acid Phosphate and 150 lbs. Muriate of Potash per acre would supply these necessary ingredients and, except where the land is in a very high state of cultivation, 120 to 150 lbs. Nitrate of Soda, applied as a top dressing, would be required to supply the amount of nitrogen to produce a maximum crop."

FREE copies of this and other bulletins dealing with the important subject of fertilizing, may be obtained from

Presentation to Rev. P. C. Guthrie.

A most enjoyable evening was spent at the social held at Palmer Road Hall, on Monday night, Feb. 19th. The most interesting event of the evening was the presentation of a purse containing $200.00 as a gift from the parishioners to their pastor, Rev. P. C. Gauthier accompanied by an address in French read by Mr. Moses Wedge, and the following address in English read by Mr. Gillis:

Dr. P. C. Gauthier, Reverend and Dear Father: As almost all of your parishioners are assembled here tonight; we have chosen this as an opportune time to offer to you a small token in evidence of the appreciation and high esteem in which you are held by one and all of us. Since your coming amongst us your labours in our best interests, both spiritual and temporal, have been unceasing and untiring. Always ready to lend a helping hand to each individual and to the parish as a whole, always ready to encourage us by word and example in everything pertaining to our advantage and to the further advancement of the parish as testify the establishment of the Farmers' Institute and the Creamery at St. Louis both of which undertakings have been successful to the highest degree owing to your painstaking and assiduous efforts. Therefore in consideration of your work in both enterprises we beg to offer you this purse in recognition of your interest and perseverance and hope you will accept it in the spirit in which it is offered.

We also trust that you will be spared to us many years to continue the good work which you have so nobly begun. Signed on behalf of the Committee.

Editor's Note:— We know of no one who deserves the esteem of an agricultural community more than Dr. Gauthier. He is untiring in his efforts to further the cause of agriculture by taking an active part, by precept and example, in the leadership of the onward movement. The editors of the Maritime Farmer can heartily say "Amen" to the sentiments expressed in the above address. Dr. Gauthier's example might well be followed by other members of the clergy. We feel assured that their efforts would be highly appreciated.

FLORICULTURE.

H. A., St. John, writes:—I have a fairly good sized plant that sits on a pedestal in the hall. A few days ago I discovered that two leaves were dried up, withered and curling. They seem to be dead, now. About two weeks ago the door was left open on a quite cold day and I was afraid the plant was hurt at that time; but it seemed so long before I noticed the curling of the leaves, that it is possible that the trouble is caused by something besides frost.

The trouble mentioned might be caused by excessive drouth or overwatering caused by poor drainage. It is, however, highly probable that in your case the chill has done its work. The damage would not show for at least a week, unless the plant was frozen solid, which of course did not occur, in your case. Cut off the affected leaves close to the stalk and you will probably save the balance of the plant.

Whenever the heavy storms wash off the covering of any of the hardy plants or bulbs in beds, it should be replaced at once, also see that the drainage of such beds is unimpaired. Dutch Hyacinths and also Daffodils are now coming in. Watch these bulbs if cellared and don't let them send up soft growths but bring them to the light as soon as the signs of buds appear.

A. H., St. John, writes:—I enclose a leaf taken from a Rubber Plant vesterday, which is the third leaf lost in a year. Brown spots appear and in a short while the leaf turns yellow and drops off. This plant is six years old and about six and one-half feet high and shows signs of branching out below. Can you tell me the cause of the trouble and what can be done to prevent it as well as to save any leaves not affected?

The loss of three leaves on a plant of the size mentioned during the space of a year is quite normal and would not require attention were it not for the black spots mentioned, which indicate poor drainage, and too much water. This should be corrected at once. It is also possible that the plant requires repotting. If the roots are crowding out through the drainage, repot it. Nothing can be done to save leaves that are spotted now, but the correction of the above mentioned errors should prevent any further loss of foliage.

Watch your bulb beds this spring. Do not let the water stand on them or ice will form and cause injury in the blooming time.

Let an I H C Engine Save You Hours of Drudgery

WHY should you waste hours of valuable time sawing wood, pumping water, shelling corn, or turning a grindstone by hand when a few cents' worth of gasoline in an I H C engine will do it all and let you use your time for important, profitable work?

An I H C gasoline engine will furnish cheap, steady, dependable power for running the pump, woodsaw, feed grinder, corn sheller, grindstone, emery wheel, cream separator, churn, washing machine, wringer, etc. It furnishes power to sharpen plows and disks, light the farm buildings, and do many other kinds of work.

I H C Gasoline Engines

are simple. They are economical of fuel. They are made in all styles, vertical and horizontal, portable and stationary, air and water-cooled, in sizes from 1 to 50-H. P., to operate on gas, gasoline, naphtha, kerosene, distillate, or alcohol. Gasoline and kerosene tractors, 12 to 45-H. P. Sawing, pumping, spraying, grinding outfits, etc.

The I H C local agent will show you the engine and explain its good points. For catalogues and full information, see him, or, write the nearest branch house

Handling Cows for Record Work.

"It is not necessary to dry up a cow to get a record. A cow must be developed from year to year if she is to excel in record work, and the only way to develop a cow is to keep her milking. We never dry up a cow in order to get a record, and we will

MAXWELL LAWN MOWER

with its Crucible Steel Cutter Knives cuts so smooth, clean and easy, and holds its edge so well, that every man who appreciates a good lawn mower is sure to be pleased with it.

The whole mower is compact and perfectly balanced that it makes cutting the grass a light, pleasant exercise.

All sizes from 8 to 22 inches wide—with wheels 8 to 11½ inches high, and 3 to 6 knives.

MAXWELL CHAMPION High Speed Washer

has the largest opening of any washing machine, Every woman will appreciate the convenience of this big top.

Maxwell's Champion is the only washer that can be worked with side crank as well as hand lever.

The tub is Red Cypress—the wood that grows in the water and will never rot.

MAXWELL Jewel Food Cutter

chops all kinds of Meat, raw or cooked, and all kinds of Fruits, Vegetables, Crackers, Bread, Cheese, Nuts, etc., into clean-cut, uniform pieces—fine or coarse as wanted — without mashing, squeezing, tearing or grinding and with great rapidity.

Does away with the chopping knife and bowl entirely, doing the work in one-tenth of the time and producing an absolutely uniform product.

5 different cutters for coarse or fine mincing. Simple in construction—easy to clean—strong and durable.

Write for catalogue, if your dealer does not handle these household necessities.

DAVID MAXWELL & SONS, - 130 - ST. MARYS, Ont.

not do it. The only cow we ever dried up in order to get her record did not accomplish anything.

"A cow requires to be dry for two months in any case, and if we do not give her this rest she will take it out of us in her decreased production during the following lactation period.

"Just how to go about making a record with any particular cow cannot be written down in black and white. There are many things to be considered and no two cows will respond exactly the same to any given treatment. A cow has got to be right, and then get the best of care. There is no use stating just what feeds to give, since what one cow will eat another often will not care for, and then one must get something that cow will eat."—D. C. Flatt in Farm and Dairy.

Montreal Prices

BUTTER is firmer in Montreal, but demand is not as keen as it was. Choice creamery butter,33c. to 34c.; dairy, 32½c. to 33c.

CHEESE—15c. to 15½c.

EGGS—There was a shortage of eggs in Montreal last week. It is expected, however, that there will be a marked increase in supplies and decline in price during the next few days. Eggs are selling at 38c. to 40c. for strictly fresh.

POULTRY—turkeys, 18c. to 20c.; geese, 13c.; chickens, 13c. to 16c.; fowls, 8c. to 10c. and ducks, 17c.

APPLES—$2.25 to $4.50 per barrel.

VEGETABLES—The high prices are bringing in supplies from small shippers, and stocks held are quite ample to meet all requirements of the trade. The feeling is a little easier. Green Mountains, $1.65 to $1.70, on track; Irish potatoes, $1.55 to to $1.60. At this time last year Green Mountains were selling at 87½c. to 90c. per bag.

HAY—same as Toronto prices.

HOGS—$7.75 per 100 pounds; ewes, $4.75 to $5.00; bucks and culls, $4.00 to $4.50; lambs, $6.75 to $7.00.

Butchers' cattle, choice, $6.75 to $7, a drop of 25c.; do., medium, $5.50 to $6.50; do., common, $3.50 to $4.50; canners, $2.75 to $3.75; butchers' cattle, choice cows, $5.25 to $5.50; do., medium, $3.75 to $4.50; do., bulls, $3.50 to $5.50; milkers, choice, each, $75 to $80; do., com. and med., each, $50 to $65; springers, $30 to $45. Calves, $3 to $12 each.

In Montreal bran is $24.00 to $25.00; shorts, $26.00 to $27.00; middlings, $28.00; moullie, $30 to $34.

POTATOES IN NEW YORK.

In New York, No. 1 Bermuda potatoes, late crop, are selling at $6 to $7 per bbl., State, $3.50 to $3.62 per 180 lbs.; Maine, $3.50 to $3.75 per 180 lbs., and No. 1 Jersey sweet potatoes $1.25 to $1:65 per basket.

BRITISH HAY MARKET.

The London market is easier for Canadian clover mixed, and is quoted at $22.80 to 23.04.

HAY IN NEW YORK.

Prime hay is quoted in New York at $1.35 per 100 lbs., No. 1, $1.30, and No. 2, $1.15 to $1.20. Clover mixed is $1 to $1.20.

Special Excursion Fares to the Pacific Coast.

The Intercolonial Railway is offering special excursion fares (second class) to Pacific coast points, good going during March and up to April 15th. These are good to points in British Columbia, Oregon, Washington, California, Arizona, Nevada, Texas and Mexico. Particulars regarding these fares to various destinations may be learned from the nearest ticket agent. Those wishing to profit by the extremely low fares will do well to remember that the Maritime Express carries an up to date colonist car through to Montreal on which the traveller will find every comfort and convenience.

Let me Tell You, Face to Face

"Here is my question:—A $100 roof gives a $500 building several years of service. A $125 Pedlar roof gives the same building 100 years of service, because it is a 100-year roof. Is the extra $25 wisely spent?"

"I Have Learned How to Make You a Roof That Will Last One Hundred Years."

"I have been a good-roof missionary all my life. I invented Oshawa Metal Shingle for lightning protection. I made improvements in it and got my design perfect after 50 years. My roof was rain, wind, snow, ice, fire, lightning and sun proof. I still needed one thing—the longest lasting metal—non-rusting. At one step, when I found this metal, I achieved a roof to last you a whole century."

"There is No Building Made Right, If the Roof Is Not Perfect."

"Guard a building on top, and you guard the whole building. The weather beats fiercest on top. I tell you, no building ever made is better than its roof. I want to see you build a good roof. Skimp the walls, if you skimp anything. See your roof is right. Your good roof gives three-fold building service.

"Why, in 50 years, a little thousand-dollar barn protects $75,000 worth of hard-harvested product. A poor roof can easily rot, and waste, and lose for you twenty times its cost—twenty times the cost of a Pedlar Oshawa Shingle roof. With most roofs lightning may burn all—with my roof you can defy lightning to try its worst on your barn."

"I Make a Roof that Answers Every Roof Demand You Can Think Of."

"My roof has 'give' in it. It can expand in the sun. It can shrink in winter cold. It does this without drawing the nails that hold it. It is ice proof. Frozen snow cannot gouge it open. It is clean. Dirt cannot rest on it. Roof water gathered from it is pure. My roof covers its nails. They cannot loosen or rust. My roof is not too heavy or too light— it is ventilated.

"As a result, wind or storms cannot lift it bodily, like a shingle roof. It is spark proof and fire proof. It is lightning proof. It still protects a building if the frame sags. A man can lay it without special tools. He can only lay it right, the right way. Every protection, besides the protection against rust, comes with my roof. You lay my roof on ordinary framing.

"Why Do You Get Such a Good Roof from Me ALONE?"

"You can't get a roof deal like mine anywhere else in the world. This is because other metal shingles haven't my design or metal. Other metal shingles haven't my years of pioneer knowledge to back them. They haven't my ground-floor patents—my skill—my earnest and hard work of years on the one problem—a perfect metal roof. I, only, can make you a roof with the right metal in it to back the wear, because my shingle metal is the only one that make the deal honestly possible."

"Can You Lay It, and Lay It Right? Yes!"

"You, a tinsmith, anybody, can lay my roof—whoever can handle a hammer. I spent years in making my Shingle so it couldn't be laid wrong. There isn't an exposed nail, after you are done. The roof is ventilated so it is almost cyclone proof. My roof is earthquake proof, if your building under it is. It is settlement proof, sun proof—lodged ice cannot open it.

"Yes, sir, you can lay an entire Pedlar roof yourself in my Oshawa Shingle, while you are patching a few shingles on a leaky cedar roof. When you figure its service, the price of my roofing is ridiculously small. My price is very fair. Your bill for my roof is kept down, because folk all over the world are also buying. Big output means big quality at little price.

"Every Roof Owner Should Have the Help in My Big Roof Book FREE."

"My roof book, 'Roofing Right,' ought to be in your hand this very minute. I will be glad to send you a free copy. The book shows roofs, of course. It shows good buildings under them. You can get a score of hints for barn design, planning and arrangement, even if you don't buy my shingle.

"But the main point about my book is that it tells you all you want to know about Oshawa Shingles. I would like you to know its goodness. I am proud of the perfection, excellent quality, fine service, easy laying, beauty and adaptability of my clean Oshawa Shingle. It is a bigger thing than it looks to give any man weather, fire, lightning, and time-resisting protection rolled into one article. My 'Roofing Right' Book tells you all about a roof that 'Makes good' for 100 years."

"Send Me a Post-Card To-day."

"Get my 'Roofing Right' Book to-day. A post-card will bring you the whole story of my perfected Oshawa Shingle. Ask one of my branches near you. Or write me direct. Remember you better any building threefold if you put the best roof you can get on it. People on the other side of the earth know this. You write me.

"ORANGE LILY SAVED MY LIFE"

These words or expressions having the same meaning are contained in hundreds of the letters I have received during the past year. Many were from women who had suffered agonies from falling of womb; others from women who had escaped dangerous surgical operations as the tumors and ulcers had been removed by the action of Orange Lily; and others who had suffered from suppressed menstruation, leucorrhoea, painful periods etc. For all these and the other troubles known in general as Women's Disorders, Orange Lily furnishes a positive scientific, never-failing cure. It is applied direct to the suffering organs and its operation is certain and immediate. As a trial actually proves its merit, I hereby offer to send, absolutely free, a box worth 35c., sufficient for ten days' treatment to every suffering woman who will write for it. Enclose 2 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

STRAWBERRY PLANTS

FOR SALE—[illegible] [illegible] [illegible] [

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initisl or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

J. F. ROACH, 'Phone 111 **SUSSEX, N. B.**

"WILLOW FARM" FOR SALE.

"Willow Farm" is situated two miles from the centre of the town of Amherst, which is a growing manufacturing town of over nine thousand population, and one of the best markets in Canada. There is a good public school within forty rods of the house.

The farm consists of one hundred and twenty three acres, forty three acres of marsh and eighty of upland, sixty five of which are under circulation.

The upland is in a high state of cultivation as a large stock of cattle have always been kept on the place and for several years a short rotation has been followed. The soil varies some but is mostly a good loam quite free from stone and easily worked. The pastures are well watered by springs and brooks.

The house is 28x38 feet, two stories with ell 16x20 with good cellar, heated by furnace. Barn 50x80 feet with basement stable which will accomodate forty cattle and six horses, also root cellar holding two thousand bushels. Carriage and impliment shed 26x86 feet and other out buildings all in first-class repair.

The fencing is nearly all of woven wire and in good order,

A wood lot of 70 acres, three miles from the farm will be included in the sale.

A retail milk trade of about one hnndred and twenty quarts a day will be sold with the farm if desired

This is one of the finest live stock and dairy farms in Cumberland County; a beautiful home and a splendid opportunity for the right man. Apply to

Shubenacadie, N. S.

IN THE MARKET PLACE

St. John.

GRAIN—Oats, 55c. to 60c.; Buckwheat, $2.30 to $2.75.

LIVE STOCK—Milch Cows, $50 to $65.

DRESSED MEATS—Beef, (carcass), 5½c. to 7½c.; Beef, (retail), 10c. to 20c.; Mutton, 7c. to 9c.; Veal, 9c. to 11c.; Pork, 8½c. to 9½c.

DAIRY PRODUCTS—Creamery Butter, 30c. to 37c.; Dairy Butter, 30c. to 35c.; Cheese, 14c.

POULTRY AND POULTRY PRODUCTS—Eggs, 25c. to 28c.; Fowl, 90c. to $2.00; Chickens, 90c. to $2.00; Geese, $1.25 to $1.50; Turkeys, 28c. to 30c.

FRUIT—Apples, $2.50 to $3.00.

MISCELLANEOUS—Hay, $10 to $15.00; Straw, $9.00 ton; Beef Hides, $11.50; Calf Skins, 50c. to $1.00; Lamb Skins, 50c. to $1.00.

VEGETABLES—Carrots, $1.75 to $2.00; Potatoes, $2.25 to $2.50; Turnips, $1.00; Beets, $1.50 to $1.75.

The potato market is off this week, prices have fallen off 50c. per bbl. Butter still has an upward tendency and it is almost impossible to get good stock. Beef is quite plentiful this week. Veal is coming in in very good shape and commands good prices. It pays the farmers to give better attention to bringing good stock to the market as they are then always sure of realizing good prices and quick sales. Fowls bring good prices. The prospects of active markets looks good this spring.

Halifax.

GRAIN—Oats, 56c. to 57c. bagged; Peas, split, $6.75 to $7.00 bbl.; round, $5.75 to $6.00 bbl.

FEEDSTUFFS—Bran, $27.00 to $28 ton; Shorts, $29.50 to $30.00 ton; Middlings, $30.00 to $30.50 ton; Oil-Cake, $2.40 to $2.45 bag; Cottonseed Meal, $1.80 bag; Gluten Meal, $33.00 ton; Corn Meal, $1.80 to $1.82½ bag; bbl., 20c. more.

GRASS SEEDS—Timothy, 19c. to 19½c. lb.; Com. Red Clover, 24c. to 24½c. lb.; Mam. Red Clover, 24c. to 24½c. lb.; Alsike, 19c. to 20c. lb.

LIVE STOCK—Butcher's Cattle, 9c. to 12c. quarter; Milch Cows, $35.00 to $40.00; Lambs, (retail), 14c. to 16c. lb.; Hogs, (carcass), 7½c. to 9c.

DRESSED MEATS—Beef, (retail), 12c. to 22c. lb.; Pork, 12c. to 16c. lb.

HORSES—Drafters, $200.00 to $300; Roadsters, $200.00 to $250.00; Carriage, $200.00 to $250.00.

DAIRY PRODUCTS—Creamery Butter, 32c. to 34c. lb.; Dairy Butter, 28c. to 30c. lb.; Cheese, 16c. to 17c.

POULTRY AND POULTRY PRODUCTS—Eggs, 35c. to 40c. doz.; Fowl, 15c. to 20c. lb.; Chickens, 16c. to 22c. lb.; Ducks, 17c. to 18c. lb.; Geese, 16c. to 17c. lb.; Turkeys, 22c. to 26c. lb.

FRUIT—Apples, $3.50 to $4.00 bbl.

MISCELLANEOUS—Hay, $13.50 to $14.50; Straw, $8.00 to $9.00.

VEGETABLES—Potatoes, $2.25 to $2.40 3 bus. bag; Turnips, $1.25 to $1.30.

Charlottetown.

GRAIN—Oats, white, 48c. to 50c.; black, 50c. to 52c.

FEEDSTUFFS—Shorts, $1.55 to $1.60; Middlings, $1.55 to $1.65; Oil-Cake, $2.50 to $2.75; Corn Meal, $1.85 to $1.95.

GRASS SEEDS—Timothy, 15c. to 18c.; Com. Red Clover, 25c. to 28c.; Mam. Red Clover, 25c. to 30c.; Alsike, 23c. to 27c.

LIVE STOCK—Butcher's Cattle—4½c. to 6c.; Stockers, $18 to $35.00; Milch Cows, $20 to $45.00; Sheep, 3c. to 3½c.

DRESSED MEATS—Beef, (carcass), 7c. to 10c.; Beef, (retail), 8c. to 16c.; Mutton, (carcass), 8c. to 9c.; Pork, light, 7c. to 8c.; select, 8c. to 8½c.; heavy, 6½c. to 6¾c.

HORSES—Drafters, $175 to $250; Roadsters, $175 to $225; Carriage, $175 to $225.

DAIRY PRODUCTS—Creamery Butter, solids, 32c.; prints, 33c.; Dairy Butter, 25c. to 27c.; Cheese, 15c. to 16c.

POULTRY AND POULTRY PRODUCTS—Eggs, 25c.; Fowl, 8c. to 10c.; Chickens, 9c. to 14c.

FRUIT—Apples, $2.50 to $4.00 per bbl.

MISCELLANEOUS—Hay, $12.50 to $14.00; Straw, $6.00 to $7.00; Wool, 25c.; Beef Hides, 10c.; Sheep Skins, 60c. to 85c.; Lamb Skins, 60c. to 80c.

VEGETABLES—Carrots, 40c. to 50c.; Potatoes, 40c.; Turnips, 16c.; Beets, 40c. to 50c.

There is little or no change to report in prices of farm produce since our last. Eggs advanced to 26c. but dropped back one cent to-day and price is now 25c. as quoted. Dressed meats are fairly plentiful except pork which although offering in larger supply than a short time ago, is still scarce and sufficient quantity not yet being offered to cause any decline in prices worth mentioning but we look for lower prices for all grades as soon as the March supply offers freely, although it is doubtful if prices will drop below 8c. for select hogs.

Butter is scarce and prices are irregular. Oats are also offered in very limited supply, and local consumption is establishing a price beyond their value for export.

Very few vegetables are offered as yet but we expert increased offerings as soon as the weather moderates. Hay is offered fairly freely but prices remain firm or slightly higher.

Toronto.

BUTTER—Creamery prints, 36c.; solids, 35c.; Dairy prints, 34c.; solids, 33c.; real fancy prints are selling as high as 40c. per pound. The supply is not plentiful.

EGGS—Eggs have taken a sudden drop. The decline amounts to eight cents and may go lower. Present prices range in the vicinity of 27c. per dozen. Retailing prices range from 30c. to 40c. at local Ontario points.

POULTRY—Live chickens and fowls 10c. to 12c. per pound; ducks and geese, 12c. to 14c. per pound; turkeys, 17c. per pound. Dressed Poultry brings two to three cents more per pound.

CHEESE is a little higher at 17c for large and 17½ for twins.

VEGETABLES—Delaware Potatoes, $1.90 per bag; Cabbage, $3.00 per barrel; Carrots, $1.40 per bag; beets, $1.40; turnips, 60c.; parsnips, $1.40.

HAY—No. 1 extra quality, $15; No. 2 ordinary, $13.50 to $14.00; No. 3, $10.50 to $11.00 and clover mixed, $10.50.

STRAW—$8.50 to $9.00.

OATS are selling at 50c. to 52c.

BUCKWHEAT—70c. to 75c.; peas, $1.15 to $1.25.

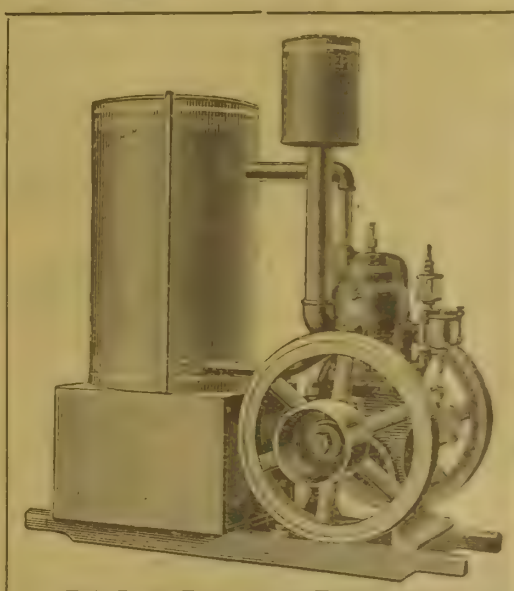
Page Work Engines

Since our first advertisement appeared a month or so ago giving particulars and prices of our engines, we have had many orders. People seem to readily realize that they cannot afford to go without an engine at prices we make—a 3 1-2 horse power at $138. or a six horse power engine for $188. The engines use for fuel either gasoline or kerosene. These engines are powerful but light and can be carried from place to place where work is to be done.

You may be wishing you had an engine to help you do your work, but may be unfamiliar with engines and have an idea that a gasoline engine is an uncertain, complicated thing. If you think so your fears are groundless, for gasoline engines are so developed nowadays as to be just as reliable as any other machine. Anyone can operate a gasoline engine, as there is no danger. No engineer is needed. There is nothing to blow up. Simply put gasoline or kerosene in the fuel tank and give the fly wheel a turn and away she goes for all day. Go off and leave it if you want to. It is safe.

A gasoline engine is started instantly. You do not have to wait to get up steam. When you are through work stop the engine and, and consumption of fuel stops at once. Hence, you can run the engine for only ten minutes, and you use only the fuel required for operating it that length of time.

As to cost of fuel, a Page engine uses only 7-8 of a pint of gasoline or kerosene per horse power per hour. Hence, if you were operating our 3 1-2—4 horse power it would use less than 1-2 gallon per hour, which at 15c per gallon would cost you only about 7 1-2c per hour. Probably you would not work the engine to its limit and fuel would be less accordingly, for a gasoline engine uses fuel only in proportion to the work it is doing.



This Page Engine on a Farm will pump, saw wood, run a cream separator, washing machine, churn, silage cutter, fanning mill, root cutter, grindstone, etc. It may be easily moved from one place to another, and is always ready to run. It does the laborious and tedious chores of the farm.

We are getting many orders from the Maritime Provinces, especially from Prince Edward Island, although Nova Scotia and New Brunswick are not far behind. Dealers find the Page engines a good line to handle as they are so low in price and so high in quality. We are getting so many applications for agency that we hope to have a thorough organization in the engine branch of our business in the near future.

Marine Engines

We have in above referred particularly to stationary or work engines. But we are also supplying marine engines from 2 to 36 horse power. Catalogue of either style on request.

YOU WANT TO

Make Money

Dividend of 10% assured the first year

Five going concerns have decided to amalgamate for the purpose of not only making more money but so that they may expand and thus be in a better position to handle their increasing business in all Canada.

Each of these concerns are making good on the capital invested and it is estimated that under the proposed amalgamation that money will be saved both through the buying and selling ends and also that expenses will be cut in two, that it will be possible to earn dividends of 20 per cent in a short time.

During the next few years there will be millions of dollars spent in Canada and it is the object of these concerns to put themselves in a position to get a large share of this money. This could not be so easily accomplished if each were to operate separately.

Each of the five concerns are engaged in separate pursuits consequently no market condition can effect more than one at a time. Each are handling lines that are in daily use. The object is to have the stock of the company as widely distributed as possible. It can only be purchased in not less than $100.00 shares and not more than $1000 to one person.

We are not selling stock as a favor to the buyer, but because with additional capital the company can make money very fast.

The control of the company will be in the hands of incoming investors and the new capital is to provide for expansion.

Every Investor has an opportunity to assist in developing business and when 400 new families become customers there will be a further earning of 20 per cent. to investors.

We have no time to waste and our object of advertising in this way is to secure the names of parties that are desirious of a safe investment.

The company will be under the management of a man and a directorate that will bear the closest scrutiny. Everything will be made clear when we answer your communication.

If you have money that is not earning what it should please fill in the enclosed coupon and mail it today.

I have Money that I want to invest in a safe way and would be pleased to have you send further information.

This Does Not Bind Me in Anyway.

Sow Your Grain in Drills Get LARGER Crops More Profits

Sowing grain in the old style way is wasteful. While some spots get too little seed, most of the ground is generally too thickly seeded.

But sow your seed with the Champion Disc Drill and waste is eliminated. It sows with precision, just the right amount of seed in every inch of every furrow. The same amount of seed goes farther, produces larger crops and yields you more profits. The Champion way is the profitable way to sow your grain.

Frost & Wood

Champion Disc Drill

The Champion Disc Drill has made a great name for itself in "dirty" fields. Corn roots, tangled grasses and straw manure do not bother the Champion. It cuts right through the "meanest" field, sows the seed and covers it up.

The Champion is a wonderfully light draft machine. Instead of the usual iron to iron bearings at the hubs of the discs, the Champion has sets of dust-proof ball bearings. It's the only disc drill so equipped. This smooth-running, friction-reducing feature, together with no neck weight, make the Champion Disc Drill easier on horses than any other disc drill we know of.

The Champion Disc Drill is a strong substantial machine. It has a stationary axle to which the frame and grain boxes are solidly attached. It is built to give you many years of satisfactory service.

It is so built, too, that it is a pleasure to sow seed with it. There are no notches into which a shifting lever must be shoved. You can sow to a fraction of a pint by simply adjusting the Index. The Champion is thoroughly tested before it leaves the factory, and you are thus assured of getting perfect satisfaction when your Disc Drill bears the name "Champion."

We have a special Drill Catalog that we are waiting to send you directly we receive your name and address. Send us a card by next mail.

DE LAVAL
CREAM SEPARATORS

No Excuse for any Cow Owner Being Without One

There is no reason why any cow owner who sells cream or makes butter should be without a cream separator and there is no excuse why he should not have the best separator.

Any creameryman or experienced dairyman will tell you that a good cream separator will give you a great deal more and a great deal better butter than you can make with any gravity or setting system, and equally, of course, more and better cream, if you are selling cream.

The DE LAVAL is acknowledged by creamerymen and the best posted dairymen the world over to be the **"World's Standard"** and the one and only separator that always accomplishes the best results possible and always gives satisfaction.

You cannot make the excuse that you cannot afford to buy a De Laval, because it will not only save its cost over any gravity setting in six months and any other separator in a year but is sold either for cash or on such liberal terms that it will actually pay for itself.

A little investigation will prove to you that the truth of the matter is that you really can't afford to make cream or butter **without** the use of a DE LAVAL cream separator.

The nearest De Laval local agent will be glad to demonstrate this to your own satisfaction, or you may write to us direct.

Volume 17. ST. JOHN, NEW BRUNSWICK, MARCH 26, 1912. Number 12.

N. B. Farmers and Dairymen in Annual Convention

A Large Delegation Present.

THE thirty-sixth Annual Convention of the New Brunswick Farmers' and Dairymen's Association convened in the Council Chamber of the Fredericton, City Hall and in the heated portion of the New Exhibition building on March 18th to 22nd inclusive.

Prominent farmer delegates from all parts of the province were in attendance to exchange experiences and carry back to their respective localities tidings of how the progressive march of Agriculture is being conducted in various other sections of the province.

THE PRESIDENT'S ADDRESS.

Col. H. Montgomery-Campbell, President of the Association, occupied the chair at the various sessions. After calling the Meeting to order on Monday evening he read the following presidential address:—

Gentlemen of the Farmers' and Dairymen's Association:

I am glad to see such a large attendance of delegates. It proves that the farmers of the province are awake to their advantages, and recognize that to keep abreast of the times they must adopt the newest methods to meet the demands of the market which is at our doors.

It is estimated that in the immediate future $20,000,000 will be expended in the construction of the Valley Railroad and the St. John Docks. A very large percentage of this must necessarily find its way into the pockets of those who provide the means of subsistence for the army of workers who will be employed in these great undertakings; and the question is, will you farmers of this province take your share of this money by meeting their requirements?

Very few people realize how much is now imported into this province that could be grown by ourselves. Even now, for instance, in our own markets, we find New Zealand butter competing with the home product.

In the dairying districts the breeding and care of cattle is as well understood and carried out as in any part of Canada; but in the growing of crops the farmer is far behind his requirements and very few grow enough crops and roots to feed the cattle from October till the middle of May, and they are, therefore, obliged to buy so much middlings and millfeed at $32 a ton that there is very little profit, even when they receive 33 cents per lb. for their butter.

To make this meeting more instructive the Department of Agriculture has brought horses and cattle of different breeds and a course of instruction will be given in the exhibition buildings during the morning and afternoons of this week. The most competent instructors have been engaged to lecture and impart information, which cannot fail to benefit us in our endeavors to improve the condition of agriculture in this province.

Useful and instructive as this course will be, however, it does not go nearly far enough, and I think the time has come when the government should establish a chair of agriculture at the University of New Brunswick. If this were done I am satisfied that our farmers would appreciate its advantages, and their sons attend in large numbers, and thus availing themselves of the opportunities afforded, would cause the advantages of practical and systematic farming to become general.

During the last few years great progress has been made in the planting and care of orchards, particularly on the St. John river, and with proper care and selection this will add great wealth to these districts. A thorough study of the soil and conditions has been made and the optimism of the people is so great that they are bound to make a success of the undertaking. The fruit exhibitions that have been held in St. John for the last two years have proved that this province can grow apples equal to any in America.

Perhaps one of the most important matters we should strive for, is co-operation. The manufacturers and merchants would find it impossible to continue their business if they did not watch the markets, and place their products on sale at the proper time. Farmers, on the other hand, often overload the market by all selling at the same time, and the result is prices go down until there is little or no profit. This was the case with pork last year. The market opened at a fair price and everyone hurried to sell—in consequence the price went down and very few had anything to sell when the market came to its normal condition. The retail price did not change and the middleman got the benefit.

I have heard of a creamery that begins making butter in the spring, and instead of putting the butter on the market as it is made, waits until it has several cwts. and then sends it to be sold. The result is a low price, not only for themselves, but for all the butter sold to the same market. Whereas with co-operation and a little forethought, the former prices might have held for some weeks.

If the directors of agricultural societies would meet once a month and talk over the prospects and market reports, it would be a long step in the right direction.

It is only by co-operation and by standing together that farmers can accomplish the work they are destined to do in making this province, with all its natural advantages, its seaports and railway facilities, the leading agricultural centre in the Dominion of Canada.

WELCOME BY MAYOR OF FREDERICTON.

In introducing His Worship, Mayor Hooper, of Fredericton, who extended to the delegates the city's official welcome, President Montgomery-Campbell said the city of Fredericton could not make a choice of Mayor that would be so satisfactory to the farmers of New Brunswick as Mr. Hooper, who has been closely allied with the farmers of the Maritime Provinces in their onward march of progress, by his popularity and his efficient management of the Fredericton Exhibition.

His Worship referred to the pleasant relationships and dealings he had had with the farmers and stock breeders of the Maritime Provinces during the years he has been managing the Fredericton Exhibition. He was pleased that one of his first official duties, as Mayor of Fredericton, was to welcome the various N. B. F. & D. A. delegates to his city. The farmer was the live wire that formed the basis of the country's wealth. He invited each and every delegate present to visit the industries of his city of which every citizen was proud. He also referred to the Immigration Congress recently held in Fredericton and pointed out the relationship that existed between that Convention and the Farmers' Parliament. Our resources should soon attract the young people of Canada so that their slogan would become "Go East Young Man Go East" instead of the old saying "Young Man Go West." The "Back to New Brunswick" slogan should be forwarded by every good-thinking citizen putting his shoulder to the wheel and boosting for all his worth. He advised the farmers to take for their battle cry the words on the Convention button: "I am for New Brunswick" and they would find that ere long the beautiful province of New Brunswick will come to its own; it requires work but it can and will be done, if we all remember the saying: "It takes a live fish to go up stream; any dead one can float down."

THE REPLY.

In the absence of Mr. Anders Jensen, Vice-President of the Association, who was scheduled to reply to His Worship's Address of Welcome, Mr. Bliss M. Fawcett, the Secretary, referred to the hearty welcome that the citizens of Fredericton had accorded the Farmers of the Province in the past and concluded by stating that he would like to see the farmers put their shoulders to the wheel and have a New Brunswick farmer occupying a chair for Agriculture at the University of New Brunswick.

THE COUNTY VICE PRESIDENT'S REPORTS.

overflowed with optimism and faith in the possibilities of their respective counties. The most salient points in the various reports will be published in other columns of the Maritime Farmer.

FRUIT GROWERS' PRESIDENT.

President C. N. Vroom, of the New Brunswick Fruit Growers' Association, brought the greetings of his Association and said that both Associations had similar work to perform.

Mr. Vroom referred to the impetus that the St. John Fruit Shows had given the fruit growing industry of the Province. The fruit shows had been good advertisements for the Province. The New Brunswick Apples exhibited at the recent Fruit Growers' Convention at Ottawa compared favorably with those from the other Provinces of Canada.

In the progress of fruit growing he was pleased to be able to say that 40,000 apple trees had been set out during the past year and that 60,000 trees would be set out next season.

But figures showed only a small portion of the work being accomplished. The publicity work accomplished had attracted great attention from everywhere. The fruit shows held at St. John showed that New Brunswick apples were the equal of any grown and were particularly well colored.

The McIntosh Red was the highest priced apple and according to Prof. Macoun, the Dominion expert, could be grown to better advantage in New Brunswick than in any other place in Canada.

The Provincial Government was doing a good work in supplying the farmers with high grade nursery stock at cheaper prices than they could secure them themselves.

There were many syndicates taking up commercial orcharding in the Province and he understood that just recently an inquiry had been received from a party in Calgary anxious to secure a tract of 2000 acres to take up commercial orcharding.

Mr. Vroom urged New Brunswick farmers to grow the best and most profitable varieties of apples, pointing out that the trees bearing profitable apples took up no more room on their farms and would be much more profitable investments than scrub trees. He said that every farmer in New Brunswick should have at least five acres of his land as an orchard. He pointed out the excellent conditions in New Brunswick for marketing apples in the Old Country, and urged those engaging in fruit growing to keep to one profitable variety in each neighborhood so as to have proper quantities for shipping.

CANNING INSPECTOR.

Mr. C. S. McGilvary, the Dominion inspector of canned goods, was then introduced by Mr. W. W. Hubbard, secretary for agriculture.

Mr. Hubbard drew attention to the important economic question of all stores of the province having their shelves loaded down with canned fruit and vegetables all from outside the province while there were such excellent opportunities for carrying on the canning industry in this province. Mr. McGilvary had been sent here to meet some gentlemen interested in the establishment of canneries in New Brunswick.

Mr. McGilvary, who was well received, said that he was just back from the Canadian West, where they boost their country, talk about their possibilities and believe what they say. He told of the immensity of the fruit growing industry in British Columbia, where he has been told, there were seven million fruit trees and in New Brunswick and Nova Scotia he had seen districts where apples could be grown just as well and the fruit would be of just as good a quality as could be grown in British Columbia.

Mr. McGilvary gave an interesting review of the history of the canning industry, explained the possibilities of the business and told the meeting that there were canned fruits and vegetables to the value of $1,591,393 imported into Canada in 10 months.

In closing, Mr. McGilvary spoke of the advantage of proper education for one engaged in agricultural pursuits and told his audience that the East offered opportunities equally as good as those of the West, without as hard work.

THE FINANCE COMMITTEE.

Messrs. Lewis Smith, Henry Wilmot and Edgar Shamper were appointed as finance committee.

TUESDAY EVENING.

On Tuesday evening, Mr. Armitage, representing Dodd & Struthers, Lightning Rod Manufacturers, gave an interesting demonstration with his artificial thunderstorm machine, on how lightning strikes buildings and how it may be avoided by a proper system of rodding. The audience was highly interested in Mr. Armitage's remarks and demonstration.

BREEDING, FEEDING AND CARE OF HORSES.

Following the electrical demonstration, Geo. J. Dickson, of Chatham, read an interesting paper on Breeding, Feeding and Care of Horses. Mr. Dickson's paper will be published in a future issue of the Maritime Farmer. The interesting account of Mr. Dickson's practical, every day practice in the care of horses was much appreciated and at the close of his address the Association tendered him an unanimous vote of thanks.

DRAFT HORSES IN NEW BRUNSWICK.

The outlook for horses in New Brunswick, with particular attention to draft type was the subject of a carefully prepared and interesting paper by Morris Scovil, of Meadowlands. Mr. Scovil's paper will also be published in a future issue of the Maritime Farmer. That Mr. Scovil put a great deal of practical thought and the result of careful observations into his paper will be evident to all our readers.

Col. H. Montgomery-Campbell highly complimented Messrs. Scovil and Dickson on their instructive papers, after which he explained the origin of the horse and the various methods of breeding that have been practiced in bringing about the evolution from a small nondescript animal to the magnificent specimens of the various breeds we have to-day. He strongly scored the folly practiced by farmers who sell their best brood mares. He thought, the service fee of $10.00 was too small to cover the risk incurred in buying and maintaining first-class sires. In Scotland, the service fee for the famous Clydesdale stallion, Baron's Pride was £25 with a first option on the progeny of approved mares.

Dr. Standish was questioned re Naval Ill disease in foals. He explained that the trouble could be avoided by keeping the mare and foal in sanitary quarters and by taking the precautionary measure of washing the foal's navel with some reputable antiseptic.

POTATO GROWING.

In the absence of F. DeL. Clements, who was to have spoken on the subject of "Potato Growing," W. W. Hubbard reviewed the progress made by the province in recent years in the growth of potatoes, stating that last year the province produced 3,000,000 bbls. Few countries could boast a soil so well adapted to the growth of the tuber as New Brunswick. He believed New Brunswick had reached that place where, having achieved a desirable reputation, it was essential to retain it by producing the best grade and marketing it by means of the best sources. Good cultivation of potatoes was necessary and a careful selection of fertilizer alone would ensure the best results. The commercial product had proven satisfactory but the natural fertilizer of the farm with the exception of clover seed had seldom been used with success.

Mr. Hubbard told of one New Brunswick farmer whose entire crop for the next five years was contracted for by Montreal concerns at a figure below the present market price, but still one to ensure him a good profit. Other producers had been able to sell their crop in advance for seed purposes.

There is practically an unlimited demand for Canadian potatoes, said the speaker, and the outlook for the future of this industry if present high standard is maintained, is very bright. Rotation of crops had not only proved of great benefit to the soil of many farms but had a marked effect in the quality of the crop produced. The most effective alternation yet tried under conditions prevalent in this province is potatoes followed by wheat and oats and then clover. Fertilizer is used when clover is young and later crop fed to cattle.

T. W. Butler advised Agricultural Societies to get together for the growing of uniform crops of one or two commercial varieties in their respective districts.

Mr. McNally said there was no difficulty in growing potatoes in New Brunswick even on poor soil if proper methods were followed.

PROFITABLE FERTILIZER.

R. G. Murray, of St. John was called upon for his views of the fertilizer question. Mr. Murray said that according to figures published in the agricultural report of 1909, the retail price of chemical fertilizer could be reduced by about one half, were a farmer to procure the necessary ingredients and mix them on his own premises. At the present price, said the speaker, it is practically impossible for the small farmer to realize profit from the use of fertilizer. In conclusion, Mr. Murray proposed the following resolution, which he pointed out had been endorsed by various agricultural societies of the province:

L.E. KNIGHT, PRESIDENT — L.C. PRIME, MANAGER

L. C. Prime Co. Limited

St. John, N.B. March 14/12.

PURCHASING DEPARTMENT

Messrs. The "MARITIME FARMER"

St. John, N. B.

Gentlemen:-

We have been using space in your Paper for the last few months advertising our MOLASSINE MEAL, and feel quite satisfied with results; in fact, this is the only Paper in which we advertise, through which we have received cash with orders, showing you that MOLASSINE MEAL is selling much more rapidly and giving better satisfaction than we anticipated.

We are, Very truly yours,

Molassine Meal is not a food but a tonic

L. C. PRIME CO., Limited,
J. T. Merseresu — Sales Manager.

"Resolved, That it is of the utmost importance to the farmers of the province to be able to get at a minimum price the constituents of chemical fertilizer, and this association accordingly strongly urges the government to obtain and furnish to the farmers of the province the constituents of fertilizer as nearly as possible at manufacturers' prices."

The resolution was seconded by Mr. Legere and referred to the resolutions committee.

W. W. Hubbard explained that the department of agriculture had some time ago submitted just such a proposal to the government undertaking in six months' time either to have fertilizer or its equivalent in money, but on further investigation had learned that many of the farmers would be unwilling to expend the necessary amount in this way. He also showed that when freight charges and mixing expenses were considered a small profit only was left for the manufacturer and dealer, and that the farmer in paying the present price was merely paying for the convenience of obtaining the ingredients ready mixed.

The meeting then turned its attention to the appointment of committees and the following were elected to form the nominating committee:— S. L. Peters, chairman; A. F. Johnston, P. L. Alexander, M. McLaughlin, T. A. Goggin, J. T. Prescott, W. H. Moore, John Moody, E. J. Dickson, W. S. Stevens, J. F. Williams, J. W. Stevenson, W. O. Murray, J. A. Bernier.

The resolutions committee was also appointed with Lewis Smith as chairman.

THE IMPORTANCE OF THE FARM.

His Lordship Bishop Richardson, who occupied a seat on the platform, was next called upon, and in responding expressed his sense of the honor of having opportunity to address a gathering of men in whose hands lies the future of New Brunswick. He referred to the magnitude of production of potatoes on small areas in Great Britain and Ireland and said after conversation with authorities on this side of the water, he became convinced that New Brunswick has not yet reached the limit of possibilities in this important industry.

ON WEDNESDAY EVENING.

The first subject on the programme was "Co-operation." A. C. Fawcett, of Sackville, who read a carefully prepared paper on this question, in his opening remarks took issue with statements, appearing in the public press, that have a tendency to depreciate the integrity and activity of the agricultural class. Statements to this effect had recently appeared as coming from a well-known New Brunswicker and Mr. Fawcett was ready to denounce any statements that attributed indolence to his co-workers. He deplored at length the prevalence of party politics and the extent to which party took precedence over principle in questions of vital importance to the development of the country. He advocated public owned utilities and the organization of the farmers to support all legislation in the interests of the agriculturists.

THE PREMIER.

Hon. J. K. Flemming, was present to express to the Convention the interest he has always taken in the work of the association. It was a pleasure for him to meet the representatives of the great agricultural industry of the province.

The premier went on to express his belief that the future of the province lay in effecting an increase in the quantity of our farm products. The consumer is not supplied at present. Thousands of dollars of good New Brunswick money is annually sent abroad for the purchase of foodstuffs, etc., that might be grown at home.. What we want is not more market but the ability to supply the market we have. If we want to get the wealth out of this country, continued Mr. Flemming, "we want the increased production of the farmers now residing here, and one new farmer for every one we have now. The most important problem we have to face is to keep our young men on the land. We should help to remove the feeling of isolation and loneliness which is the cause of much of the present emigration from the land. The rural telephones would prove invaluable for this.

"Good roads enhance the value of farm properties and facilitate the transfer of products. The farmer is a partner of the government in the maintenance of roads. As premier I am going to try to make the life of the farmer more attractive and offer more inducements for the son to take up land adjoining that of his father. A new day is dawning for the Province of New Brunswick."

In conclusion Premier Flemming referred to the importance which he attached to meetings of this nature and expressed the hope that deliberations of the present meeting would prove of benefit, not only to the delegates in attendance, but to the entire farming community.

THE RESULTS OF COW TESTING. were discussed by C. F. Whitley, of the Cow Testing Division, Ottawa.

This subject was ably handled by the speaker and as it is a subject of vital importance, not only to the dairymen of New Brunswick, but to the dairymen of the whole world, we will publish Mr. Whitley's address in full in an early issue.

THE DAIRY COW, HER CARE AND FEEDING.

was discussed by M. H. Parlee, one of the foremost Ayrshire breeders in the Maritime Provinces. Mr. Parlee's address will also be published in full in our columns.

Another excellent paper by J. F. Roach, another prominent Ayrshire breeder, was not read owing to lack of time but nevertheless the delegates may all read its contents in a future issue of the Maritime Farmer.

SOILING CROPS IN RELATION TO DAIRYING.

was the subject of a highly instructive address by Prof. G. H. Cutler, of McDonald College. This subject of Soiling Crops is of vital importance to all breeders of live stock, particularly so to dairymen. Prof. Cutler handled his subject in terms that were easily understood and showed how much cheaper milk could be produced by the use of green crops than by any other system. The subject will be discussed in future issues of the Maritime Farmer.

THE DUAL PURPOSE COW.

P. G. Mahoney, of Westmorland Co. said he had had an interview with Dr. Landry re the importation from England of a number of bulls of the milching Shorthorn strain. He had been assured that if the farmers needed forty or more a man would be sent to buy the bulls. On arrival in New Brunswick these bulls will be sold at public auction and the Government will make up the difference between the cost price and the retail sale cost of the animals.

THE FINANCIAL STATEMENT.

showed collections during the year of $195.34 and disbursements of $172.65 leaving a cash balance of $22.69.

CHANCELLOR JONES

of the University of New Brunswick spoke briefly expressing his pleasure on being able to attend a meeting of farmers and get their views on the questions of agriculture. Dr. Jones laid claim to some experiences as a farmer and believed that farms in the province are an unquestioned asset. Most of the farms in the province are increasing in yield and in value. This is a desirable state of affairs which cannot be duplicated elsewhere. If the farmers can increase the value of their farms there will be a great future for the industry in this province.

He believed the time is not far distant when the University of New Brunswick will be able to help the farmer in more ways than one. The schools can scarcely accomplish what the university will do for the farmer.

Col. Campbell believed an agricultural chair in the University would be a great help to the farmers and endorsed the views of Chancellor Jones.

THURSDAY EVENING.

Beef Production in the Maritime Provinces was the subject of interesting addresses and papers on Thursday evening by Prof. E. S. Archibald, Truro, N. S., Chipman Harper, Sackville and C. Ashley George, Upper Sackville. The general trend of these addresses was that the Scotch type of Shorthorn was not as profitable an animal for the average farmer to to raise as was the English milking strain. Cows of the former type only produced sufficient milk to raise their own calves, while the English strain had individuals with records of over 10,000 pounds of milk in one year, thus giving a profit from the dairy as well as from the beef standpoints. Prof. Archibald outlined the breeding, feeding, housing and general management of beef steers laying particular emphasis on good ventilation, cleanliness and plenty of light in the stables. Growing steers did not require warm quarters providing they were kept dry. He advocated raising fall calves and showed how the fall calf would in nearly every case outclass the spring calf.

Mr. Harper, had been successful in procuring a calf from a dairy bred Shorthorn bull and by comparison with his beef bred calves he would say that to him the dairy Shorthorn calf looked more satisfactory.

Mr. George's paper will appear in a future issue.

PATRONIZE HOME BREEDERS.

T. W. Butler again emphasized the necessity of putting forth a plea for legislation that would have the tendency of forever doing away with the scrub bull. In reply to a statement by Mr. Hubbard re the importation of bulls from Ontario, Mr. Butler said it would be more encouraging to New Brunswick breeders if it were ascertained how many bulls could be bought in New Brunswick. After the local supply was exhausted was time enough to send money out of the province to encourage competition against our own local breeders.

SHORT COURSE IN LIVE STOCK JUDGING.

The morning and afternoon sessions of the Convention were devoted to Short Courses in judging Horses, Cattle, Sheep and Seeds in the New Exhibition Building.

Dr. J. Standish, Truro, N. S., lectured on Light Horses and Heavy Horses during Tuesday's morning and afternoon sessions respectively. Thoroughbred, Standard Bred and Clydesdale Horses as well as some Grades were shown in the ring and with a score card in the hands of each delegate, the Doctor explained the various points in the conformation of the respective horses, showing the points to look for and also those to avoid in breeding.

Dairy Cattle and Beef Cattle were studied on Wednesday. Prof. E. S. Archibald and Andrew Elliott, Galt, Ont., being in charge of the classes. As in the horse classes of the previous day, each student was given score cards and Prof. Archibald went over the various points required for an ideal animal and instructed the class to score the various animals. Holsteins were furnished by Harding Bros., of Welsford. There were also a few Ayrshires and B. M. Fawcett showed two dairy type Shorthorn cows and two steers, the get of similar cows.

Sheep were shown on Thursday morning by Wm. H. Moore, Scotch Lake, and Prof. Archibald instructed in the art of judging from the mutton breeder's standpoint. After which Jas. A. Telfer, lectured on the breeding, care and management of a commercial flock of sheep.

The discussions on the various classes of live stock were very interesting and undoubtedly each and every delegate felt that they could return to their homes with a better knowledge of what to look for when purchasing stock.

SEED JUDGING.

On Thursday afternoon and on Friday morning and afternoon sessions, Prof. G. H. Cutten, of McDonald College and S. J. Moore, of the Seed Division, Ottawa, conducted classes in Seed Judging. Oats were judged on Thursday afternoon, Clover Seeds on Friday morning and samples of the Seeds shown at the Seed Fair on Friday afternoon. The New Exhibition Building was admirably adapted for this work. The delegates sat down at long tables and each one was given several samples of grain or seeds and by a process of questions and answers the instructors enumerated the desirable and undesirable qualities of the respective samples and thus the students were led to judge the samples for themselves.

THE SEED FAIR

held concurrently with the Farmers' Meetings in the Exhibition Building was, without exception the best ever held at Fredericton. We were pleased to note that the grain from some of the prize winning fields in last summer's standing crops competition stood at the head of the list.

The number of entries were as follows:—wheat, 32 entries; oats, 49 entries; barley, 10 entries; buckwheat, 11 entries; peas, 17 entries; beans, 19 entries; timothy seed, 2 entries; corn, 8 entries; potatoes, 57 entries; onions, 9 entries; turnips; 9 entries; mangels, 4 entries.

Owing to lack af space the list of prize winners is crowded out of this issue.

One of the exhibitors was Mr. E. Jarvis, Stanley, N. B., who holds a bronze medal for the heaviest bushel samples of white oats, black oats, wheat, barley and buckwheat awarded to him by the Colonial and Indian Exposition in London in 1886. There are two other medals of a similar character owned by other parties in Stanley.

RESOLUTIONS.

The following resolutions were adopted:

Resolved that a vote of thanks be tendered to the Mayor and City Council of Fredericton for the use of the Council Chamber for holding of Annual Meeting.

* * *

Resolved that a vote of thanks be tendered to Hon. D. V. Landry for providing lecturers, judges and live stock for the short courses held during the Annual Meeting of the Association.

* * *

Moved by Bliss M. Fawcett; seconded by Lewis Smith:—

Whereas the Beef industry in the Province of New Brunswick has declined very rapidly in the past twenty-five years and is steadily decreasing, and,

Whereas, large sections of the Province are very suitable for beef production, and,

Whereas private enterprise cannot meet or help this rapid decline,

Therefore resolved that this Association ask the Legislature of the Province to import from England a number of dairy Shorthorn bulls, whose dams have produced from 6,000 to 10,000 pounds of milk annually and that such importation be sold in at least two places in the Province.

* * *

Moved by R. G. Murray; seconded by Alex. Smith:—

Resolved that it would be greatly in the interest of the farmers of this Province if they were enabled to obtain at the manufacturer's price the constituents of chemical fertilizer, and this Association strongly urges upon the Government of this Province that it take such measures as it may to obtain and furnish to our farmers the raw materials for the home manufacture of chemical fertilizer at as near as possible to cost price.

* * *

Moved by Morris Scovil; seconded by S. L. Peters:—

Whereas, the horse raising industry of this Province is in a far from satisfactory condition owing to the pollution of stock due to the use of unsound stallions, and,

Provinces of the Dominion have taken action to do away with this condition,

Whereas, other Provinces of the Dominion have taken action to do away with this condition,

Therefore resolved that this Association place itself on record seeking legislation to do away with this condition by making it compulsory that all stallions standing for service be inspected for soundness by a veterinary inspector authorized by the Government and that all stallions showing hereditary unsoundness be prohibited from standing for service.

* * *

Moved by J. T. Prescott; seconded by C. Ashley George:—

Whereas in the near future the Legislature of our Province will be dissolved and the electors called upon to choose their respective representatives, and,

Whereas the feeling of Agriculturists that their profession is not as fully represented in our Legislative

(Continued on page 442).

NITRO-CULTURE.

Editor Maritime Farmer:

I have had a number of inquiries, asking whether nitro culture bacteria for alfalfa, red clover, alsike clover, peas, beans, etc. would be supplied from this College, as here-to-fore. We will continue as before to supply bottles of nitro bacteria, each containing sufficient to inoculate 60 pounds of seed. In general, I might say that we have extremely favorable reports from those who have used these nitro cultures on the various leguminous crops in the past.

EDITORIAL NOTES.

Improved machinery is naturally taking the place of inefficient help on many farms.

* * *

An untidy roadway mars the attractiveness of the farm and in so doing it detracts from its value.

* * *

Owing to the small majority by which it was carried at the annual meeting of the Canadian Ayrshire Breeders Association, the resolution charging $5.00 for diplomas for each cow that qualified in the Record of Performance test has been cancelled. The Directors thought it wise to reconsider this resolution at the next annual meeting before putting into effect.

* * *

Have you everything in readiness for the coming of the lambs and young pigs. The success of your year's work will be measured by the profit you reap. Every lamb or young pig that dies an untimely death through neglect, or otherwise, is a direct drain on your resources. Do not be caught unprepared. A few minutes and forethought properly executed may save you many after regrets.

IS IT WORTH WHILE ?

There are many enterprising young farmers in the Maritime Provinces who are doing their level best in an honest endeavor to make their country more prosperous and better because they live in it. They are slowly but surely climbing the ladder of success but owing to lack of capital and the difficulty of obtaining same at reasonable rates they are hampered in their operations. Could these young men have access to a little extra capital, ninty-nine per cent of them would make good use of it and they would be enabled to scale the ladder of success in much shorter time. The transformation that would take place in Maritime Canada during the next decade would be amazing. The soil would be better cultivated and better fertilized and as a consequence larger and better crops would be raised. Live stock would increase in point of quality and quantity. Better and more commodious buildings would be erected in which the live stock, crops and farm machinery would be cared for. The farm homes would be equipped along more modern lines so that the contrast between rural and urban dwellings would not be so noticable. Young men, who are under present conditions forced to leave the farms, in order to earn some capital, and are spending the best years of their lives in this attempt would remain at home and devote their energies and their best years to the upbuilding of their own locality. The improved conditions would make it an easy matter for these young men to return the borrowed capital with reasonable interest in the course of a few years. Every industry in the country would feel the uplifting influence of the farmers prosperity.

At the recent Immigration Congress at Fredericton, N. B. Dr. C. H. McIntyre of Boston outlined a scheme whereby a government could handle a financial aid to farmers schemes. Dr. McIntyre's address will appear in full in our next issue. After you have read it over and seen how other countries are profiting by the adoption of such plans, we think you will say that the plan is feasible and worthy of the earnest consideration of our government. It would certainly be a boost in the right direction—the casting of bread on the waters with the prospect of having it returned buttered on both sides.

AID TO FARM LAND SETTLERS.

The Premier of Nova Scotia has introduced a bill to his House of Assembly, the purpose of which is to encourage settlement on farm lands in Nova Scotia. The bill as introduced by the Premier, is one of the most advanced pieces of legislation ever presented to any Legislature and in this respect Nova Scotia takes the lead in progressiveness.

The preamble of the Bill draws attention to the fact that there are numbers of people in various parts of the British Empire and elsewhere, some of them former residents of this province whom it would be desirable to induce to settle on farms in the Province.

In order to be of assistance to such people the Government is impowered to give a guarantee to any loan company, making an advance, to an amount not exceeding the difference between fifty per cent. of the appraised value and the amount of the loan with interest. At present loan companies will advance only fifty per cent. of the value of the farm lands, which amount is frequently not sufficient to enable a farmer to purchase a farm, in addition to necessary farm stock, machinery, etc., which must be provided.

The Government may further arrange with a loan company to advance an additional amount not exceeding the difference between fifty and eighty per cent. of the loan, the total loan in any one case not to exceed $2,500. The first repayment in all cases to go to the reduction of any Government loan or guarantee.

The Act also applies to persons already engaged in farming in this Province, who will have the same benefit under it as new settlers.

The Government is also authorized to borrow on the credit of the Province, the sum of $200,000 to carry out this legislation. The Government is further authorized to buy real estate which may be subdivided into farms or lots, on which buildings and fences may be erected, the Government to resell such farms or lots so made. The Bill further provides for the appointment of appraisers or other officials necessary for the carrying out of the Act.

COMMUNITY ANIMAL BREEDING.

In all lines of agriculture co-operation is desirable, but in no branch is community cooperation of more importance than livestock breeding. When once a community is found suited to breeding a certain breed of animals much can be gained by organization to promote that breed. This enables farmers and stockmen of limited capital to breed animals when without organization they could not secure the service of high-class sires.

Certain countries in Europe have become famous in breeding a single breed of animals and the progress made by community co-operation could not have been achieved in any other way. The government, too, has in many instances rendered valuable assistance which of course it could not do as effectively if a number of breeds had been kept. As examples we may cite the Rambouillet sheep, the Percheron and Belgian horses.

Community breeding generally simplifies marketing high-class animals. When it is known that desirable animals may be found in a certain section of the country, buyers do not hesitate to visit that section and make their own selections. It is expensive to travel over several stations and visit a few isolated localities where perhaps there are only a few animals in each locality to see.

When the community is organized to promote a single breed it is an easy matter to advertise this breed. All of the distant fairs may be visited and large sales advertised and the expense borne by the association. A campaign of education in animal breeding can be inaugurated and much information disseminated. These are only a few of the many advantages that co-operative breeding affords.

LEARN TO DO SOMETHING.

Boys, don't be afraid of the overalls. Prepare for your life work by getting the most knowledge possible about the particular line of work you want to make a lifework.

It is the day and the age of utility; and when you come down to brass tacks, usefulness, actual service, is the only thing worth having. There are spheres of usefulness removed from overalls, but the preliminary and formative stages of the usefulness of whatever kind or quality has upon it the badge of labor. The technical school is where the theory of useful service is explained and taught. It ought to have 10,000 where it now has 100 students.

The Formation and Cultivation of Soil.

The formation of the soil is a subject about which many volumes have been written, so you will not expect me to deal exhaustively with it.

The formation of the soil is due to erosion, to the action of air and water upon the rocks and to glaciers. Formation of soil is going on all the time. It is forming at the bottom of every river and wherever frost and sunlight are attacking rocks it is constantly forming. Soil, then, is formed by erosion, by washing of glaciers, by action of frost and sunlight. The formation of soil as we understand it means an intermixture of mineral matter in fine form, and a certain amount of vegetable matter. Until the vegetable matter is added, the soil is of small value. In the West where we have virgin soils, the thicker the layer of vegetable mould, the more valuable is the soil, and the earliest settlers were aware of this as they carried with them a spade and dug down to see how deep the layer af vegetable and mineral matter was. In some places it is two or three inches, and other places five or six feet. In these Maritime Provinces, the vegetable mould is in most cases very shallow. The mixture of mineral matter and humus or decayed vegetable matter is especially in the woods, very shallow indeed, and the only place where it is found in abundance is on the marshes and the cleared spots in the valley bottoms—there the mixture of this mineral matter and humus is usually very thick.

We cannot, however, confine ourselves to such areas. We must include the uplands; there we have to handle the soil in such a way as to increase vegetable matter and bring about such conditions as are capable of producing crops. Soils, as generally recognized by the farmers, divide themselves into three or four classes. We hear a man say he has a clayey farm,—clayey loam, or a sandy farm, and sometimes of a farm where there is a great deal of black muck. All these soils are capable of producing crops if properly handled. The crop that is produced to advantage on any good soil is supposed to be distinctive. Clayey and loamy farms will grow roots best, sandy farms are in a good position to grow apples and roots, black muck will grow hay. My experience is that if the soil is fairly well drained and at the same time such cultivation given during the growing of the crops, where cultivation is possible, any kind of soil will grow any kind of crop. The kind of crop will depend not upon the soil, but climatic conditions and what the farmer is after, the cultivation given that crop and sequence of crops handled. Every crop depends upon the farmer to a much greater extent than we are willing to admit. There is scarcely a farmer who has not accused his farm for not producing better crops.

The cultivation and crop sequence are the agencies which control the crop returns from the farm. I have been handling a farm whereon are to be found all these varieties of soils I have mentioned, and every grade between these classes from a heavy clay and light sand down to the deepest black muck, and I know that no matter what the soil the crops depend upon the cultivation given almost entirely. Our experience will bear this out. To show you what cultivation will do, and indicate the possibilities and averse conditions on this farm without the addition of commercial fertilizer, and with the purchase of barnyard manure, we were able to produce about three times the crop the average farmer in Canada produces. The average farmer, according to bulletins of that year produced $15.50 per acre worth of crops. On the experimental farm, we produced $43.14. It costs the average farmer, $4.00 per acre to cultivate, and it costs us some $12.00 per acre to cultivate our fields. The average farmer has a net profit of between $5 and $6. We had a net profit, over and above cost of rent, labor and manure, of between $31 and $32 about six times what the average farmer had. That quite remarkable difference was due almost entirely to the different methods of cultivation followed by us as contrasted with the average farmer. I do not say that every farmer follows a bad method, but so many fail as to bring down the average. I have often said that I wish it were possible to reach the bad farmer. Nearly every farmer that comes to these meetings comes from the best farms and is already agreed that the remarks I have to make and contentions I have made are his opinions. The only thing we can do as long as they are loath to come out, is to talk to the good fellows.

As told you, we have had good results on the experimental farm at Ottawa; in fact, I need not confine my remarks to Ottawa. The Truro Agricultural College returns have been much superior to those of the average farmer. The MacDonald College in Quebec returns are very much superior, and are due in every case to proper methods of cultivation and right crop rotation. I know that a good many of you have heard me speak on soil cultivation previously. I feel as though I ought to have a new message, something new, to be able to tell you of some marvellous way of handling the soil that has never been known, to readily, easily, quickly get the soils in such condition as to increase crops.

After all these years on the experimental farm, my own experience, study of the question, and especially the effect of cultivation and rotation I am still convinced of the importance of rotation. The rotation is being gradually introduced into farm practice in Ontario. In investigating the farm practices, only about 40 per cent. of the farmers in Ontario had rotation in actual operation on their farms; in Quebec only 4 per cent.; in these Maritime Provinces, the percentage is not much better than the Province of Quebec. No system of rotation seems to be in operation on the average farm. Rotation seems to be, in many cases, a term of unknown meaning. It means things done in order, in succession. Example: The following of one crop with another on a given field, and the following of each crop with such crop as is likely to do best after that crop. If you are producing crops for dairying in this province, you would require a certain amount of clover hay and would also find it necessary to provide yourself with a quantity of roots, or succulent forage for the winter; a certain amount of straw, some short feed to supplement the roots and hay. There are three crops required on your farm. You must therefore make provision for these three. You might set aside a certain field for hay, another for roots, another for grass. I must say that many farmers as so ill-advised as to follow such lines. Some farmers do, a good many do in many parts of this Dominion of Canada do just such foolish things which mean small crops, exhausted soils, and highest cost of production. The most foolish things any man can do. Just the result of following such methods as are commonly followed. On the contrary, where a rotation is introduced, where the light crop follows the crop it should follow, there is a sequence of crops: roots, grain, clover, peas. I do not suppose it is necessary to devote any arable land to pasture, because going through on the railroad one can see a fair proportion of land which cannot be used for crop production. I would follow a rotation of three years, roots, grain, clover, then begin with roots again. We have tried this year after year on given areas, and find there is no rotation which can begin to give the wonderful results in crop production and in low cost of unit production as this rotation. The grain crop materially increases the humus in the soil, which, added to the nitrogen, forms the most important fertilizing constituency of any soil. The rotation will have a wonderful effect in reducing the cost, and reducing the cost should be the aim of every farmer, and that is one reason why we so strongly advocate the introduction of the rotation. If the farmer does not desire to grow merely clover hay, and wished to include some timothy, he should adopt the four year rotation: roots, grain, clover, timothy hay, and then roots again. Another rotation is the five year. This is a rotation you would find satisfactory where you are growing roots to a considerable extent. With us in Ontario and Quebec, and with you in many parts of this Province where you can grow corn to advantage, corn is a profitable grain crop. We can produce corn more cheaply than roots. In the average year, a ton of corn will cost only ⅓ or ¼ as much as roots. Under these conditions, a ton of corn is worth just as much, and makes just as many tons of ensilage as roots, but here where roots must continue to be the staple production, this rotation is as follows: First year, pasture or timothy hay, then that soil or sod should be turned under in August, cultivated, and handled in such a way as to keep weeds down and cause sod to decay; next year, grain with the clover seeded down; next year, roots; the next, grain; and seeded down one year in clover, then pasture again. This five year rotation enables you to double crop returns in six years, so you see it is a very effective rotation in building up the fertility of the soil and on this depends the crop returns.

Seeding down: I would not say how much to sow. We sow about 8 pounds of red clover, 6 or 7 of Alfalfa, 2 pounds Alsike, 6 or 8 pounds of timothy. If Alfalfa will not grow, make the red clover 12 instead of 8, and use three pounds of Alsike. You will notice that I am advocating a very heavy seeding whether Alfalfa will grow or not, for this reason. While the seeding may be expensive, it would cost you $3.00 or $4.00 per acre to seed down properly, cultivate it and wait for results and you will be much more than reimbursed, and you will be sure of a good catch, and your crop is in very much less danger of not appearing at all than thin seeding. You will have a much superior quality of hay, more hay, better hay; in this way more nutritious and easily digested. The hay, as we cut it, consists of stem and leaves. If the stem is woody and hard to digest, the percentage of hay digestible is much lower than when the hay is cut at right stage, therefore heavy seeding is better in three ways: quantity, quality and certainty of crop.

A year or two ago at the Experimental Farm, we had a good catch, but our neighbor had none at all, because he would not handle his land properly. He used just as much manure, but he was unwilling to put in operation those methods which we considered scientific, and stuck to the old plan. Our methods have demonstrated over and over again their value, and everyone can do just as much.

I have in my mind's eye, a field which some ten years ago, we handled on the Experimental Farm. I took a forty-acre field and divided it into five lots: Timothy, Orchard grass, Alsike, red clover, and a mixture of the various classes of Alfalfa. On one side of the Alfalfa, we had red clover, on the other side, timothy. The next year we broke the field up and sowed corn. You could see a difference in the crop of Alfalfa; not so much where the red clover had been, but certainly eighteen inches higher on Alfalfa than on the timothy, therefore, Alfalfa is one of the best crops we can grow for preceding a root crop.

A sod is essential to rotation. A two year rotation of roots and grain is not a rotation in the best sense of the word. A rotation should give you better crops year after year; it does that by the adding of humus to the soil, and humus is added by the turning under of the sod. The best part of rotation as to improving soil fertility and consistency is the year when it is sod; if it is pasture, better still.

Your retiring president said something about the depopulation of rural Canada. Your Agricultural College principal, Prof. Cumming, has said that the depopulation of rural Canada was not so important as many people made it out to be. I agree with him. It is not important for the reason that a man with a team or with four horses to-day can do as much as his grandfather and all his neighbors could do in the same length of time. I remember when I was a lad of seeing my father go out with a half-dozen hired men and tackle a field of hay. When I was twelve years old, we got a mower, and I went out with a horse and mower and did as much work as five or six men. It is the same in all lines. We have been compelled to introduce machinery on our farms, and are able to do six times as much as our fathers did in the same time, and do it better, therefore, we don't need the same amount of help to produce farm products on our farms, but we could do better. That is a point in soil cultivation that has been receiving my attention for twelve years. This cry of rural depopulation was taken up, and has been gaining in volume and intensity for the last ten years. It has been treated from the wrong point. It is not merely the using of more men on the farm we want to make better use of the men we have, and we can do it. To begin with the plowing operation. We have been experimenting at Ottawa with the single, two, three, and five furrow plow. The five-furrow plow was handled by a gasoline engine. I would not recommend your introducing it around here. There are parts where it can be used to advantage, and you can introduce other methods that will materially lessen the cost of plowing. Where we have good big horses at Ottawa, and average hired men, it costs $2.00 per acre with single furrow plow. Two horses on a two-furrow plow costs a little over $1.00.

I took a disc harrow with 16 discs 16 to 18 inches, and a double and single harrow and put them all on the same field, one-third to each. The single cost 90c. per acre, the double, 70c., and the double cutaway 45c. Do not be satisfied with a little bit of a harrow with two sections, with a big team in front and a good husky hired man, but get three or four horses, and a harrow with five or six sections and cover the ground in half the time. The same way with

HORTICULTURE.

P. E. I. Fruit Growers.

At the Fruit Growers' meeting held in Summerside, P.E. I., in connection with the recent Provincial Seed Fair, Mr. Albert Schurman occupied the chair and Mr. T. A. Peters, the Island fruit inspector, in the course of an interesting address, explained why apple trees do not fruit heavily every year, the reason being that the fruit buds for the next year have no chance to form in the midst of a heavy crop. A moderate bearer bears more regularly year after year. He commended the Duchess apple as one that, shipped promptly, can be sold to advantage in the British market as well as in the local markets.

One of the reasons why fruit growers did not realize what they would call a satisfactory sale was due to the fact that in many cases the fruit was badly handled in packing . Mr. Peters favors box packing and showed from actual returns from sales that apples in boxes brought more in the British market than apples in barrels. He demonstrated the packing of apples in boxes and barrels so that the least possible amount of bruising would occur. Mr. Peters advised the Island fruit growers to stick to a few commercial varieties, grow them extensively, pack them carefully and the home and foreign market would take care of all they could raise at remunerative figures.

Prof. Ross, A. A. McNeil and others took a lively part in the discussion and helped by the aid of timely questions and advice to make the meeting profitable and interesting.

Bowker's Pyrox.

W. E. E., Kings Co., N. S.:—The Bowker Insecticide Company are putting out a preparation for spraying fruits and vegetables, known as "Bowker's Pyrox" which is very highly recommended by orchardists in various States. I would like to know if any persons in Canada are using this and how it compares with Bordeaux and Lime-Sulphur sprays. Can you give me any information about it? Is there any danger of burning the fruit or foliage?

The above inquiry was submitted to Prof.P. J. Shaw, Truro, N. S., A. G. Turney, Provincial Horticulturist, Fredericton, N. B. and Prof. Macoun, Horticulturist, Ottawa, and we have the following replies:

"In reply to your inquiry of the 9th inst., would say that I do not know of any persons using the preparation you speak of and cannot give you any information concerning it."—A. G. Turney.

"I am not acquainted with "Bowker's Pyrox" and do not know of its being used in Nova Scotia by fruit growers. Lime-Sulphur and Lead Arsenate are the most satisfactory substances for speay mixture for apple trees just now and if a better one comes along we will look to the experiment stations to tell us of it, I suppose."—P. J. Shaw.

"In reply to your questions of recent date, in regard to the Bowker's Pyrox, I may say that I do not know any fruit growers in Canada, who are using this spraying material.

Mr. Shutt, the Dominion Chemist, may have analyzed this material, and I have handed your letter to him, and no doubt you will hear from him shortly."—W. T. Macoun.

"We have not analysed a sample of Bowker's Pyrox, nor indeed have we seen the material, but I quote the following analysis from the Report of Massachusetts Experiment Station 1911.

BOWKER'S PYROX.

Moisture	58.09	per cent
Copper Oxide	4.21	"
Arsenic "	6.79	"
Lead "	16.35	"
Calcium " (lime)	5.27	"

—Frank T. Shdtt, Dominian Chemist.

LATER.

"Since writing you the other day on this sdbject we have come across some additional data, which seem to show that this material has both insecticidal and fungicidal properties. It is sold in the form of a paste and is apparently a mixture of lead arsenate and Bordeaux mixture. An analysis from the Bureau of Chemistry, Washington, D. C., furnisnes the following results:

Water	50.0	per cent
Lead Oxide	27.0	"
Copper "	2.5	"
Arsenic "	9.0	"
Sulphur Trioxide	.7	"
Calcium Oxide	.75	"
Undetermined	10.05	"
	100.00	

From these figures we may deduce that pyrox contains in the neighborhood of 35 per cent. of lead arsenate, or a little more than half that found in good brands of lead arsenate pastes. As to fungicidal value, 100 lbs. of pyrox would make 80 gallons of spray of approximately the same strength as the 4:4:40 Bordeaux Mixturef"—Frank T. Shutt, Dominion Chemist.

Work of New Brunswick Horticultural Branch.

During the past two weeks a number of the illustration orchards have been visited and pruned by R. P. Gorham. Work was begun at Waweig, Charlotte County, in the orchard of Mr.W. E. Armstrong. The Hoyt Station, Golden Grove, Sussex, Salisbury, Sackville, Baie Verte, Upper Queensbury and Stanley orchards were visited successively. In general the trees appeared to have passed through the winter remarkably well, only a few branches being found broken by snow, and no evidence of girdling by vermin noticed.

The character of the winter has been very uniform over the whole southern section of the province where the above mentioned orchards are situated. The fall remained open and mild so long that even where the trees made a late growth the wood had a chance to ripen up well before cold weather came in. No storms of any consequence occurred until after the beginning of the New Year and up to the present there has been no great depth of snow in any of the orchards. Only one sleet storm occurred during the winter and it was so slight that no damage was done. The temperature was very low in all parts of the province but so far as can be determined at present none of the trees have been seriously injured. All the illustration orchards have been supplied with spraying outfits and materials and will this year be in good shape to resist the attacks of the insects and fungi. The prospects for a good season of growth and a fair crop of fruit on the older orchards looks particularly bright at present.

The 1911 report on Horticulture and the proceedings of the Fruit Growers' Association will be ready for mailing in a few days. A thirty-two page pamphlet on "Orchard Opportunities in New Brunswick" has been prepared by A. G. Turney, provincial horticulturist and is now being printed. It is splendidly illustrated and 10,000 copies are to be issued, many of which will be distributed in the British Isles. A small illustrated leaflet on "The Forest-Tent Caterpillar" will also be issued shortly and should prove timely and useful as this pest has become quite serious during the last few years, especially in Charlotte County and portions ol York, Sunbury and Queens and gives every promise of being exceptionally numerous this season. Arrangements will be made for spraying demonstrations in the districts where this pest promises to be very destructive.

NIAGARA LIME-SULPHUR SWIFT'S ARSENATE OF LEAD.

Knocks Spots off Anything ! ! !

Spraying is an Insurance, differing from an Insurance Policy on personal property, inasmuch on buildings a loss has to happen before the insurer recovers. Spraying with NIAGARA LIME-SULPHUR AND SWIFT'S ARSENATE OF LEAD protects your fruit crop against destruction from the dreaded Black Spot and the revenges of insects.

Place your order at once, our factory is now running.

A one cent postal card will give you our Spray Calendar telling how to use our Spray to the best advantage.

Niagara Spray Co. of Nova Scotia Ltd.,

KENTVILLE, NOVA SCOTIA.

Methods That Bring Fine Syrup.

To insure a successful sugar season I would suggest that you commence the year before to prepare the wood and have it stored under cover, so as to have it well seasoned. I prefer a mixture of hard and soft flashy wood, the hard wood to make the body of the fire and the soft to make the blaze to boil tne sap at the back end of the arch. The wood should be stored in a shed outside the sugar house. In my own case the arch of the evaporator projects into the partition between the boiling place and the woodshed, with a hood connecting the arch with the partition, so that when the arch is being fired no dust can rise, be moistened in the steam and then fall into the evaporator to discolor the boiling sap.

The sugar house should be placed on a side hill, so the sap will run by gravity from gathering tank to holder and from holder to evaporator. The storage tank should be in a leanto or shed on the north side of sugar house,so that the sap can be kept as cool as possible.

You should be prepared for the first run by having your sap buckets, spouts, evaporator holders, etc., clean and ready for business, for it is the first run that is the best. Buy a spout that can be used after reaming as well as before. I consider reaming necessary to make a good quality of syrup the latter part of the season. I use a $\frac{7}{8}$ bit for tapping and $\frac{1}{2}$-inch reamer. This takes out all the foul stuff and cuts out the discolored wood andleaves a new, clean cut.

You should use tin buckets, spouts, evaporator and the storage tank and gathering tub either tin lined or made of tin. Do not let the sap come in contact with wood or galvanized iron. It is almost impossible to keep them clean. Do not tap too deep, about $1\frac{1}{2}$ inches. Remember that the most sap and the best sugar are found next to the bark, and the deeper you bore the darker and stronger the sugar. On the larger trees I use two buckets, but never two spouts to the bucket.

GATHER SAP PROMPTLY.

Almost as soon as the sap begins to run commence gathering, and as soon as gathered commence boiling, and boil as fast as you can. Use an evaporator that will permit of shallow boiling, for rapid and shallow boiling are necessary for a fine article. Gather the sap as fast as it runs, even if there should be but little in the buckets, so that when the

THE SIN OF OMISSION

It isn't the thing you do my friend
But the thing you leave undone
That gives you the bitter heartache
When the work of the year is done.
When your apples are all worm eaten
And the "taters" blighted and small
When the use of a "PERFECT SPRAY PUMP"
Would have saved them one and all.

Oh, the apples, you might have had, my friend,
If you'd only sprayed the same,
"Oh, the "tater's" you've thrown away, my friend,
That would have been clear gain,
These would have paid for your spray pump,
And have left you a happier man.
Then buy the best "A PERFECT"
And save them while you can.

The "Perfect Spray Pumps"

ARE MANUFACTURED BY

R. B. WESTHAVER, MAHONE BAY, Nova Scotia.

AGENTS WANTED. Write for Catalogue.

storms come you will not have a lot of rain-water and sap to boil or throw away, for usually the sap has After the storm take a small, short-handled mop and wash out the buck- . nailed mop and wash out the buckets. Turn them down to drain, and then hang to the tree again.

With covers this cannot be done, as you have no water in which to wash them. Wash the evaporator after every run, as well as the gathering tank and storage. Strain the sap into the gathering tank, again into the holder, and also the syrup when drawn from the evaporator. For straining the syrup I use a conical strainer made from the heaviest and finest all-wool flannel I can find. This will take out the malate of lime if the syrup weighs 11 pounds per gallon.

Keep the lime off the bottom of the pan, as it will darken and injure the flavor of the sugar. This can be done by letting stand in the bottom of the pan for a short time a dilute solution of muriatic acid and then thoroughly cleaning it, or it can be removed by a careful man and a sharp chisel. Boil until the syrup will weigh 11 pounds per gallon; can and seal while hot, about 180 degrees.

It is much less work to make the syrup than the sugar, keeps much better, and usually sells better. One gallon syrup will make about eight pounds pail sugar cooked to 230 degrees, or 7½ pounds at 240 degrees. While there are some sugar orchards where it is impossible to make a nice flavored and light-colored article, still you should strive to make the best you can. People are being educated up to demand and are willing to pay for such goods.—L. K. Osgood in N. E. Homestead.

Second Canadian National Apple Show.

From present indications, it is altogether likely that the second Canadian National Apple Show will be held either in Toronto, Ont., or Montreal, Que., before the end of the present year. We are pleased to see that the fruit-growers of the eastern provinces are finally awakening to the importance of boosting and taking advantage of this national enterprise which had its origin in the far west.

We trust, however, that the gentlemen who devote themselves to the promotion and management of the exhibition, will see to it that vegetables and other fruits are not allowed to mar the beauty and educational features of the show, or invade the sacred courts of King Apple. Do not make it an agricultural exhibition, but a National Apple Show pure and simple.

The Dominion Government should contribute at least $5,000, the Provincial Government $10,000 and the city in which the show is held $10,000 toward the work. Then the transportation companies and the gate receipts should roll the total up to the neighborhood of $50,000, which is necessary to successfully carry out the undertaking; and no better investment, from an educational and publicity standpoint, was ever made. Let there be one or two National Apple Shows in the eastern provinces during 1912 and 1913, with British Columbia properly represented, and there will be no trouble in bringing large and representative exhibits from the east to the National Apple Show at Vancouver in 1914. Everybody lend a hand to convince the Canadian people of what they have, what they can do and what may be done in the Apple line.—The Fruit Magazine.

Vanco Did it

When the Buds on your fruit trees are swelling, spray the trees from the top to bottom with

"Vanco" Lime Sulphur Solution

Clean trees mean sound fruit. Spring spraying means fall profits.

San Jose Scale, Apple and Pear Scab, Aphis, Fire Blight, Mildew and other Fungi attack fruit trees before the leaves come out.

The time to attack them is before they can damage the tender buds.

One spraying before the leaf buds burst, and another just before the blossoms come out—with perhaps a third when most of the blossoms have fallen—will mean hundreds of dollars profit when the fruit is ready for packing.

"VANCO" LIME SULPHUR SOLUTION is a true chemical solution of uniform strength and efficiency. It is prepared by scientific men in a scientific way—with the specific gravity on every barrel.

It does away with all guess-work—saves the trouble of home-boiling. It is ready for use after mixing with water—has no sediment—sprays easily—and does not clog the nozzle.

You get results when you spray with "VANCO" LIME SULPHUR SOLUTION—because it is strong, uniform, clear, efficient.

FERTILIZERS—We are the only house in Canada selling only the straight Fertilizing Chemicals—Nitrate of Soda, Muriate of Potash, Sulphate of Potash and Acid Phosphate.

YOU CAN SAVE FREIGHT by buying your Fertilizers and Spray Chemicals together, and have all come in one shipment.

WRITE FOR THE "VANCO" BOOK, and turn the information it will give you into dollars. We'll gladly send you a copy, free.

CHEMICAL LABORATORIES LIMITED, 148-158 Van Horne St., TORONTO. 88

MONEY IN POTATOES

You Bet There's Money In Potatoes When You Get 60c. A Bushel For Them

Last year, the average selling price all over Canada, was 60c. a bushel, compared with 45c. a bushel in 1910. Last year, Canada's potato crop increased in value OVER SIX MILLION DOLLARS.

In February, Potatoes were quoted in Toronto at $1.60 a bag in carload lots. You bet there's money in Potatoes.

Here's a hint that will bring you in a bag of money

Plant Potatoes on your *summer fallows,* instead of letting the land lie idle. By growing a potato crop, the necessary cultivation will destroy the weeds as effectively as any summer fallow.

And the best hint of all is this—

Write for our big free book—"Money In Potatoes." Of course you grow enough Potatoes for the table. But grow more of them for the big money there is in them.

This book shows just what there is in potato growing *for you.*

It tells you what the most successful potato growers in Canada and the United States have learned about planting, cultivating, fertilizing, spraying, digging and marketing Potatoes. It tells what soils are best—which potatoes are best payers—and gives a host of hints that a man of your ability will quickly turn into money, this summer.

Make up your mind that you are going to make money out of Potatoes. Sit right down—clip out and fill in the coupon—and send it off to us to-day.

DAIRYING.

Selling Cream Vs. Whole Milk.

If a market for cream can be secured it will generally prove more profitable than selling whole milk. The cream market, however, is not always easy to find. Cream selling is so generally recognized as a desirable trade, that there are many looking for a chance to engage in it. The cream trade belongs to two classes. First, if one lives in the suburbs of a good sized town or city, he may find opportunity to sell to a caterer or proprietor of an ice cream factory. The manufacturer of ice cream makes a place for a great deal of cream, but it is a demand that fluctuates very sharply with the weather conditions. While this trade will pay better prices, it is often unsatisfactory because it means some days there will not be enough and other days there will be a surplus.

The second, and the most satisfactory method, is to make arrangements with some city milk dealer to handle the entire supply. He has an outlet for cream for coffee and breakfast food in other words, the private family trade, which is constant and regular and which he can depend upon.

The first thing in selling cream is that it must be sweet. In the private dairy there is no way so satisfactory as separating twice a day while the milk is still warm from the cow and then immediately cooling the cream to 50 degrees or lower. This makes a distinctly high-grade which needs no pasteurization and which will stand fairly hard usage at the hand of the customers.

Cream made from milk 12 to 24 hours old and well started toward souring must be pasteurized if it is to give satisfaction—and even then it will never have the perfect flavor and bloom of that made from new milk. It should be remembered that high-grade cream means milk of good quality, separated as soon after milking as possible and the cream cooled at once and kept cool until delivered.

The percentage of fat in market cream varies widely with the locality and special trade, but in a general way the standard shipping cream contains about 40 per cent. of fat. Little is sold in this way, but it undergoes varying degrees of dilution. Cream with 22 to 24 per cent. of fat will whip nicely. Only 16 per cent. of fat makes excellent cream for coffee and breakfast foods.

Taking all things into consideration, the usual advantages of selling cream are as follows: It is more remunerative than whole milk and it leaves the skim milk to be used for feeding upon the farm. Then, too, so far as labor is concerned, it is fully as easy to separate and draw to the station a small bulk of cream as to care for ice and transport a large amount of milk, but in the winter the advantage of labor is on the side of milk-selling.

Calving Notes.

Many a good cow has lost her life by being permitted to drink too heartily of cold water just after her calf has been born. It is a good plan to keep the cow up for two or three days and give her only water that has been warmed a little. This most always prevents milk fever.

A good warm bran mash is fine to give a cow just after calving. Helps to bring away the afterbirth. Some feed dry oats, but we prefer the bran mash.

Pointers for Milker and Feeder.

Two parties determine whether or not the cow works to her limit, the milker and the feeder. Both alike must enjoy their work. A wonderful thing in the way of arousing the interest of the milker is the dairy milk sheet, as it must also be a guide to the observant feeder.

With what delight does the interested milker add pound after pound to the dairy yield of milk! With what solicitude does he recognize a gradual shrinking from day to day! How careful he is to get the last few drops of rich strippings that add many points to the fat test of his pets. How cheery are his merry whistled tunes, his snatches of song as he watches the foaming milk mount higher and higher, even to overflowing the capacious bucket. His satisfaction as he announces 23 lbs. 10 ozs., a new record for Daisy or Buttercup!

MILKER AND FEEDER CO-OPERATE.

The milker from his position behind the cow is able to give valuable hints to the feeder looking to increased capacity on the part of the cow. Taken all in all, we must acknowledge the milker plays no small part in the production of the dairy cow.

But after all it is the feeder who holds the whip hand. His observation, his judgment, runs to every phase of the question. The old proverb has it: "The eye of the master fatteneth his cattle." This saying has a very wide application and can refer figuratively to thousands of varying conditions and circumstances. Our adaptation of it would be, "The eye of the feeder produceth the highest results in the functional development of the dairy cows under his charge."

NO TWO CASES ALIKE.

As the skillful physician must suit his practice to thousands of different cases, no two of them requiring the same treatment, so the wise feeder realizes that every cow in his charge demands of him a ration differing in both kind and quality.

Some cows freshening begin to milk moderately, increasing gradually for weeks; other cows start off at full blast from the first with all possible gradations between. Commonly the cow that does her 35 or 40 lbs. a day at first will soon moderate her stroke, fall off in flesh and sometimes go all to pieces in a few weeks and a magnificent possibility turns out a dismal failure. The true feeder anticipates all this and by widening and increasing his ration carries her over the critical period to a long term of high production and usefulness.

TO OVERCOME BAD TENDENCIES.

Another cow runs too much to fat on her ribs; narrow the ration more and more to counteract this tendency and get more milk as well. Another tends to run down in flesh. A wide ration is the corrective. Another is easily thrown off her feed by crowding. Cut down her ration till her appetite sharpens. Another is too loose. Vetch hay, clover hay, alfalfa hay, bran, pumpkins, squashes, turnips, kale, green corn, any one or two or more of these feeds may be responsible. Find out and rectify.

Perhaps the greatest blunder of all blunders is the waste of food involved in trying to carry too many cows. What is fed to two cows as a maintenance ration can be fed to one cow at a handsome profit and with less labor. Of man's stupendous mistakes this seems to me to bear the palm. Cut out your poorest cows, sell them to the butcher for whatever you can get, or failing in that, bury them. Don't sting your neighbor with them or the stranger within your gates.

The world will be better off from the gradual extinction of scrub cattle and the upbuilding of the better

Fragrance

WHEN you open a tin of Red Rose Coffee, you will surely be pleased with its unusual fragrance, and you will note particularly the small, even grains, free of the yellow flake or chaff which you have always been accustomed to see in the ground coffee you have used. This is the result of our new crushing process. The small grains settle quickly, so the coffee is never muddy, but always bright and clear. You will be convinced before you taste it, that it is a coffee of unusual quality. 224

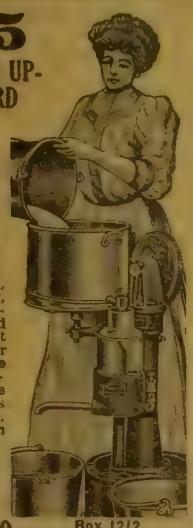
WINDSOR DAIRY SALT

Swept The Boards At All The Fairs

1911 was a triumph for Windsor Dairy Salt. Practically every prize for butter-making was won by someone who used Windsor Dairy Salt.

Those, who make their living out of their dairies, say that Windsor Dairy is their old standby. They always rely on it because they know it is pure—because it makes the richest, most delicious butter — because they win the prizes and get "Top prices" for their butter—when they use WINDSOR DAIRY SALT. 66D

15.95 AND UP-WARD



AMERICAN SEPARATOR

THIS OFFER IS NO CATCH. It is a solid proposition to send, on trial, fully guaranteed, a new, well made, easy running separator for $15.95. Skims hot or cold milk; making heavy or light cream. Designed especially for small dairies, hotels and private families. Different from this picture, which illustrates our large capacity machines. The bowl is a sanitary marvel, easily cleaned. Shipments made promptly from WINNIPEG, MAN., TORONTO, ONT., and ST. JOHN, N. B. Whether your dairy is large or small, write us and obtain our handsome free catalog. Address:

half. Breed and feed, breed and feed; lay well to heart the word of the Holy Writ, "There is he that giveth and yet increaseth. There is he that withholdeth and it tendeth to poverty." I would impress this truth upon your minds and add yet another maxim of which I also pray you take heed and be wise, "Seek ye first the typical dairy cow and her produce and all other things shall be added unto you. So shall your barns be filled with plenty and your cans be bursting with sweet cream."—J. M. Dickson, Oregon, U. S. A.

Abnormal Milk.

Milk abnormalities are important owing to their secondary action in producing disease in man.

Watery Milk—This is distinguished by an absence of fat and casein, and an excess of water. It is bluer in color and of a relatively higher specific gravity. It is caused by poor, watery food, by disorders of the stomach or bowels.

Curdling Milk—Premature coagulation of milk is of common occurrence in cows milk. It may be caused by any of the following conditions.

Digestive disorders, sour foodstuffs; from diseases of the udder, especially inflammation and swelling in advanced pregnancy.

Nympomanical Conditions—Overheating of the body from movement or exercise.

Non-Buttering, Fermenting, Frothy Milk—This is to be found in digestive disorders, also in udder diseases and in the presence of micro-organisms. Always presupposing, of course, that the fault does not lie in the method of making the butter.

Slimy and Stringy Milk—In this condition the milk can be drawn out in long, tough threads. It is the result of bacterial infection. The casual organism seems to be bacillus lactis viscosus, a form first found by Ademetz in surface waters. Ward has found this germ repeatedly in water tanks, where milk cans are cooled, and under these conditions it is easy to see how infection of the milk might occur.

Soapy Milk—A soapy flavor in milk was traced by Weigmann and Zurn color-producing bacteria that are able to grow in milk, but their action is presence of blood, which is most frequently caused by some disease of the udder. There are a number of to a specific bacillus, bacillus lactis saponacer, which they found gained arcess from the litter in the stall.

Blue Milk—Blue milk has been known for many years; it appears on the surface of milk, first as isolated particles of bluish or gray color, which later become confluent. It is from bacterial origin.

Red Milk—The most common trouble of this kind in milk is due to the so slow that they are not of much consequence.

Foreign Matter in Milk—Of foreign substances in milk, the most important are: Dirt, abnormal flavoring matter, scents, pigments, drugs and poisons, also morbid substances, such as blood, pus and various bacteria already named.

Dirt—This comes from the cow's udder, which is often smeared with dung and urine, and consists therefore almost entirely of this filth. If the cow be diseased (diarhoea, entitis, tuberculosis), infection may be conveyed to those drinking the milk. —Dr. E. F. Jarrel, Fort Worth, Tex.

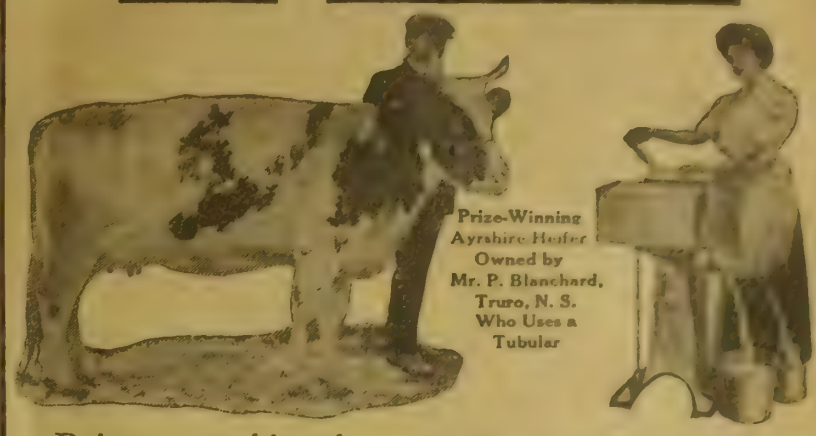
Silos and Ensilage.

It does not pay to devote high-priced land, for long periods, to pasturage and the production of hay. The land can be put to more profitable use. In order, therefore, that dairying may continue profitable, instead of depending, as in the past, wholly upon the pasture for the chief food-supply of their herds, many of our farmers are turning toward the silo as affording a beneficent solution of the feed problem. It is doubly beneficent in that it not only does away with the necessity of devoting so much land to pasture; but also, by making available a cheap supply of succulent and highly-relished food all the year round, it deprives stall-feeding of some of its objectionable features, while keeping the milk flow at a higher level. During the past two or three years, more silos have been built than in all previous years combined. The more prosperous farmers are often supplied, not merely with one, but with two good silos.

The economic value of this method of handling feed being generally recognized, the only real obstacle to the general introduction of the silo seems to be the first cost of the structure and of the machinery for filling it. More stock can be kept and profitably fed, per acre, when ensilage is grown, than by almost any other method of feeding.

The silo practically increases the producing capacity of the farm at least 10 per cent., and often more. A 160-acre farm with a silo will produce as much revenue as one of 180 acres without. Therefore, the first cost of a silo—like that of a dwelling-house, a barn or a team—should be considered part of the initial investment; and, if one's capital is limited, it is better to buy a farm smaller by 10 per cent., rather than dispense with a silo. The producing value of a silo on $50 land would be equal to that of 20 acres added to the 160-acre farm, or $1.000; on $100 land, it would be $2,000. This is a low estimate; for the stock-carrying capacity of the farm will often be increased fully 25 per cent. by the adding of a silo. As compared with its producing value, the cost of constructing the silo is small. Round wooden silos cost from $1.50 to $3 per ton of capacity; those of stone, brick or cement, from $2 to $4. It has been shown by actual experiment in Minnesota that—working co-operatively in the purchase of materials, etc.—a number of farmers in a locality may erect on each of their farms a stave silo, of 140 to 150 tons capacity, for about $275.—George P. Grout, Minnesota University Farm.

THE WINNERS



Prize-Winning Ayrshire Heifer Owned by Mr. P. Blanchard, Truro, N. S. Who Uses a Tubular

Dairymen making the most money realize that it pays them well to use only high producing cows and the highest producing cream separator. That is why Mr. P. Blanchard, successful dairyman and popular agricultural speaker of Truro, N. S., who owns the prize-winning Ayrshire heifer shown above, uses and recommends the

SHARPLES

Tubular Cream Separator

Mr. Blanchard is but one of many who are equally businesslike and use Tubulars. Tubulars are prize-winners. Have twice the skimming force of other separators. Skim faster and twice as clean. Dairy Tubulars contain no disks to chop or "taint" the cream or [illegible] flavor.

By producing the best cream and the most cream, Tubulars make a profit no other separator gets. This extra profit is simply Tubular "velvet" which Tubulars make for other kinds, [illegible] farmers and will make for you.

LIVE STOCK.

An Ingenious Device for Lamb Feeding.

There may be some hostility to the conservation movement in the West where it relates to trees, water-power or some of those allied natural resources, but certainly the wide-awake sheepmen who instituted the conservation of mutton chops by artificial means are true conservationists.

Careful sheepmen in the West have always used many schemes to save the lives of the little lambs because after waiting a year for the crop it seemed hard to lose it for want of a little personal attention. Yet each year thousands of new-born lambs were and for that matter are lost for want of better methods of saving them from starvation when for some cause their natural parents fail in their duty. Many of these tricks are well known to all familiar with the manner of handling a lambing band on a western sheep ranch. A careful herder will watch his band and, if a ewe loses her lamb, deftly strip off the skin before it is cold and sew it onto some unfortunate orphan that is just about ready to drop out to find its final resting place under some handy sage bush. The lambless ewe knowing no way of recognition but by her sense of smell, tests the masquerader, which the herder shoves under her nose and, finding it satisfactory, allows it to suck. Sometimes a foolish young ewe will refuse to own her offspring; then she is shut in a little pen, of which a good shepherd will have many close to the big corral. This pen is so narrow and close that she cannot turn or fight off the hungry little thing that clings to her side like a leech and it is not long before she surrenders to its persistence. From then on she carries out her maternal obligations in good faith.

I have seen owners who had a string of holes dug around a lambing corral, just deep and wide enough to hold a ewe and her lamb. Into this such a ewe was placed and over it a sheepskin was laid, held down by a couple of heavy logs or rocks. There in the darkness the lamb quickly found "what he most needed"—milk—and the ewe could be relied on to do her duty thereafter. Sometimes the herder catches such a ewe and, holding the little one up to her distended udder, allows it to get its fill. Generally she will not offer any further objections to its attentions because of the relief she feels when the overcharged udder is emptied, and another lamb is saved for the fall shipments. Of late years sheep values have risen to such a point that it paid to find other methods of saving them, because at the best but a small percentage of the orphans were saved by such means.

Up in Montana on the Yellowstone River ranges one sheepman has solved the problem by having a galvanized iron tank built around the outside of which he placed 20 rubber nipples over as many little tin pipes set into the tank. When set up on a frame just high enough to allow the lambs to reach it readily, and filled with warm cows' milk, it took two lively boys but a few minutes to teach the lambs to find their "daily bread" at this "galvanized iron ewe." Once taught the trick, they needed no further attention. By bringing them up in relays a large number could thus be raised. Of course not every sheepman is prepared to save orphan lambs in this manner, but where it can be done it gives big returns.

Down in Utah I found a pet cow which was doing her very best to prove to the world that the old theory that cattle and sheep could not get along together on the same range was pure fiction. She was raising half a dozen lambs which were brought to her in couples, and as fast as one couple filled up the next was brought into action. The only discordant note in the whole process was that coming from the cow's own infant, which, shut up in a nearby pen, voiced its opinion of the entire system in no uncertain tones. When I found it was being fed skimmilk from the house it had my hearty sympathy. However, as it was as fat as a calf could be and in addition to the skimmilk had all the fresh alfalfa it could eat, with a little corn chop mixed in the milk, I decided that while it possibly had a kick coming at being deprived of a mother's affection at such a tender age (and that, too, to make way for the despised sheep), yet it was really doing quite as well as it could ask for. There be many kinds of conservationists in this world.—Will C. Barnes, in Breeders' Gazette.

The Runt.

The problem of the runt in hog breeding continually comes up. There is almost sure to be at least one undersized pig in any large litter, and as this pig usually has a poor teat to suck the difference between the runt and the other pigs grows larger each day as the stronger pigs grow faster than the runt, owing to his lack of nourishment. It is an easy matter for the larger pigs to steal the runt's supply of milk, and this is what they are continually doing.

In-breeding and cross-breeding is the cause of the birth of many runts, the work of building up the breed being undone in those processes of breeding, etpecially when carried beyond the first cross. Often the litter is too large for the sow's milk supply and the runt should be transferred to another sow if possible. This will work only when the pig is less than a week old—a day or two is best—and the pig should go to a litter not older than himself, else he will be robbed in his new home and be no better off than he was before.

Wrong feeding is another reason for the stunting of a pig after he has been born into the world with sufficient size to make a proper growth. The feed may not be properly distributed and a few large pigs may get it all. Care should be taken to insure troughs and feeding space large enough that all may share equally. Some farmers allow their boar to run with the other hogs and he can camp in the middle of a feeding floor and scatter the younger hogs when they encroach on his table.

Again the small pigs may become stunted from too much feed. This is not only harmful to the weaker pigs, but is a waste of feed. Pigs should be sorted and only those of near the same size fed together. Worms, thumps, constipation and other sicknesses cause the pigs to become stunted and show lack of thrift. Plenty of pasture, good water and a gradual change in the balance of the feed are the best means of putting the stunted pigs on their feet again. Feed plenty of slops with as much milk in their make-up as possible. Some oil meal in the ration will often have a wonderful effect in bracing up the faded looking shoat.

The First Milk.

Nature has provided something in the first milk that is very essential in getting the calf's digestive machinery started right, and I think it should be permitted to have it. We usually leave the calf with the cow a couple of days, until it is nicely straightened up, then comes the most important time in the life of the calf, when we take upon ourselves its feed and care; and here is where

An I H C Manure Spreader Will Save Your Farm

THE whole future of American farming depends upon the farmers' attitude toward fertilizing. Already Middle Western farm lands are issuing a warning to their owners by producing smaller and smaller average crops. If the warning is not heeded, and fertility immediately restored to them, the lands of the West will soon be in the same list as some of those of the East—worn-out farms.

Immediate action is imperative. If your farm has not yet shown signs of reduced production you are fortunate; you can save it without a long, tedious system of upbuilding. Whether your farm is "as good as new" or not, your duty to the soil and to your children—the farmers who will follow you is: Practice rotation of crops, begin using an I H C Manure Spreader and spread enough fresh manure each year to replace the plant food drawn from the soil by the previous crop.

I H C Manure Spreaders
Corn King, Cloverleaf

are best for the work because they get 100 per cent efficiency out of the manure. When spread by an I H C Spreader, one ton of manure will produce more and better results than two tons spread by hand.

I H C Spreaders are constructed to completely pulverize manure and to spread it in an even coat, light or heavy as may be needed, over all the soil, at the same time requiring the least effort on the part of driver and horses. They are simple but effective, strong, but not too heavy; and exceedingly durable.

The beater gears are held by a single casting which keeps them in line under every strain. The beater teeth are long, strong and chisel pointed. They pulverize the manure and do it thoroughly.

The I H C local agent will show you the I H C Spreader and help you select the machine best adapted to your needs. Made in many styles and sizes. Get catalogues from the local agent, or, write the nearest branch house.

A Convincing Argument

A Pair of Cattle Gained 550 Pounds in 34 Days

ON October 7th last, L. C. Prime Company, Limited, purchased from Nova Scotia a pair of cattle which were in fairly good condition weighing respectively 1465 and 1585 pounds each. These animals were purchased for making a test of **MOLASSINE MEAL.** They were stabled for thirty-four days and fed on one pint of Corn Meal mixed with two pints Molassine Meal three times a day. On November 10th the animals were again weighed and tipped the scales at 1745 and 1855 pounds each, making a total gain of 550 pounds. They were sold to Mr. M. J. Collins, Fairville, New Brunswick. A copy of a letter from this gentleman is published below.

We do not propose to say anything further with reference to the quality of **MOLASSINE MEAL,** as this is conclusive proof that Molassine Meal is the best food on the market for fattening purposes.

The price is low, especially as compared with other feeds at the present time.

FARMERS! Is This Not Interesting to You? Let Us Hear From You.

If you wish to try a bag of this Molassine Meal and your grocer or nearest general store cannot supply you, we will see that it is delivered to you. **MOLASSINE MEAL is made in England.**

We can furnish you with the names of a great many satisfied customers and will be pleased to hear from any farmer with reference to it.

L. C. Prime Co. Ltd., St. John, N. B.

Letter From Mr. M. J. Collins.

Fairville, N. B., Nov. 15th, 1911.

Messrs L. C. Prime Co., Ltd,,
South Wharf,
St. John, N. B.

Dear Sirs:—

"The pair of Cattle purchased from you were knocked down the first of the week and I am now writing to inform you that we have never handled better beef. This beef was equal to anything coming from the West and weighed when dressed 2185 pounds."

"I can honestly say that I know of nothing that is equal to Molassine Meal for bringing Live Stock into good condition quickly."

Yours truly,

(Sgd) M. J. Collins.

we want to exercise a lot of kindness and gentleness, for if we are impatient and rough in our treatment with them they will distrust and fear us, and the chances are they will never forget those first lessons and impressions. A cow will never do her best unless she has perfect confidence in us.

It is an old saying that you can catch more flies with molasses than with vinegar; so you can do more by coaxing than driving. When teaching the calf to drink, don't push its head into the pail; wet your fingers in the milk and let it suck, and coax its head into the pail, and usually the second or third time it will drink of its own accord.

These are three essentials at this time: The quantity of milk, the temperature, and quality. Calves are injured more by not observing carefully these rules for the first few weeks of their lives than any other way. At this age their little stomachs are not strong, and a little care exercised at this time often means the difference between an unprofitable and a profitable animal.

The amount of feed at this time will depend largely on the calf and somewhat on the nature of the milk. This amount must be determined by the feeder, but this precaution is always advisable—better to begin carefully and work up to what they can handle, rather than to begin with a large amount and get them off their feed and then have to commence all over again.—F. H. Scribner.

Inflamation Among Lambing Ewes.

The condition, which in bad lambing seasons often causes such a high rate of mortality in the breeding flock, and the shepherd describes as "inflammation," is invariably one of the group of diseases technically known as parturient fever, puer peral peritonitis, metro-peritonitis, parturient septicaemia, etc., and for all practical purposes may be regarded as septicaemia originating through lesions of the genital organs, from the putrefactive decomposition of parturient products, retention of foetal membranes, decomposition of the retained foetus, or the introduction of septic matter from outside sources. Septicaemia is caused by organisms which abound in putrid solutions, and when these invade the system the blood undergoes putrefactive changes. The entry is generally through a wound, and, needless to say, the genital organs and passages of the ewe at parturition are in a condition to favour the absorption of septic matter. The means by which the germs are conveyed is by the animal lying on ground or litter previously infected by one suffering from diseases of this class, or by the introduction of instruments, cords, or the hands contaminated with septic material. The latter is by far the most fertile cause of the spread of "inflammation" when the initial case has occurred in the lambing pen, and as parturient septicaemia often causes losses amounting to 20 or 30 per cent. of the flock, it is worth while to take all possible precautions against extension, for the expense of antiseptics and any trouble entailed are nothing as compared to [illegible] may result from the neglect of general sanitary precautions and special attention to sick ewes.

WISE PRECAUTIONS.

It should be a fixed rule in every flock, small or large, that the shepherd or attendant should not be allowed to make post-mortem examinations of ewes or to skin dead lambs; and when there are ewes suffering from parturient septicaemia, or any of the troubles which are lumped together as "inflammation," "heaving," etc., they should be waited on by a separate attendant, and the shepherd should confine his attention to the healthy, or, for the time being, unaffected or yet-to-lamb members of the flock. In some cases the pelts of dead lambs are regarded as the perquisites of the shepherd, and this is a most mischievous arrangement; much better results are obtained by allowing a bonus on each lamb weaned. If circumstances prevent the adoption of precautions as regards that complete isolation of sick ewes which only separate attendance can properly secure—and when a man is single-handed, and engaged in the lambing down of his own small flock, we can conceive of a difficulty—over-all clothing should be worn that will bear sponging or sprinkling with weak carbolic acid solution or other recognised fluid disinfectant, and the boots should be rubbed in a disinfectant whenever isolated sick ewes have to be visited. Under all conditions, even when perfect health appears to prevail among the ewes and all are doing well, the shepherd should, before affording any assistance in a difficult or delayed labour, carefully srrub his hands with carbolic soap, with which he should be provided, along with other suitable disinfectants, and see that his finger-nails are short, smooth and clean.

In spite of precept and example, groups of farmers over many parts of the country still persist in breeding from positively bad mongrel sires and weedy pure-bred ones. No doubt there has been improvement, but some districts that are fairly well farmed often make a wretched appearance in matters pertaining to live stock. The advantages arising from the use of a first-class pure-bred bull have been everlastingly proclaimed, yet the man who journeys over all parts of the country finds individuals who think any bull good enough. At one place there can be seen a Shorthorn and an Ayrshire, elsewhere some nondescript past finding out in blood constituents, and so forth.

THE HORSE.

Good and Bad Shoulders in Horses.

Good shoulders comprise one of the leading attributes to be sought for in a horse, and unquestionably this point is relatively of more vital importance than any other as regards equine conformation, at any rate in the case of light-class horses. With cart horses there may be other points that rank as equally essential to their usefulness. The chief characteristic of a good shoulder is a sloping position of the shoulder-blade ("laid well back," as the horseman terms it); and upon this in the main hinges the difference between good and bad shoulders. Lightness, however, is also important, especially in relation to horses used for saddle work. These must have "riding" shoulders—that is, shoulders which are light as well as exceedingly long and sloping, running back well into prominent and strongly defined withers. Such shoulders are characteristic of the thoroughbred and well-bred hunter. The "harnessy" shoulders, as seen in most Hackneys and other horses of the typical harness order differ from the riding shoulder in being more loaded and massive, while not quite so long and well laid back. This kind of shoulder in a riding horse is very objectionable, and would put a hunter straightway out of court, whereas riding shoulders are quite as well adapted for harness as lor saddle. Hunters and horses of hunter cut do excellently in harness, but horses with thick, loaded and not sufficiently sloped shoulders afford an uncomfortable ride, and from a hunting point of view are no good as jumpers, nor can they gallop properly in heavy going, especially over plough land, their galloping being more or less lumbering. Practically the conformation of the shoulders makes or mars a hunter; and this is one of the principal reasons why so many young horses, bred by farmers with a view to sell as hunters, turn out misfits and fail to come up to hunting standard, and have to be sold as troopers to remount buyers, or as general utility nags at correspondingly lower values.

SLOPING SHOULDERS.

Turning, however, from hunters to light horses generally, the reasons why sloping shoulders are such a very desirable feature, and why straight ones call for condemnation, are that the former confer light, elastic action, and enable a horse's forelegs to stand the wear and tear which work at fast paces entails of them much better than when the shoulder-blades are placed more upright. The fact that they assist in minimising the injurious effects of wear on the legs is due partly to the more springy action they ensure, so that the feet are not pounded upon the ground so much; partly because they serve to break the force of the concussion; and partly because with this kind of conformation, less weight falls upon the horse's forehand, and the body is better balanced. Well-sloped shoulders are, furthermore, eminently favourable to a more speedy pace, be it at the walk, the trot, or the gallop. At the walk, in particular, perhaps the superiority of the sloping shoulder over a straighter one, as far as it affects the rate of speed, is very noticeable. A good-shouldered horse is able to walk away briskly, moving with a free, roomy stride, and so covering ground rapidly, whereas one with poor shoulders walks in a more or less stilted and clumsy fashion, and can only take comparatively short strides. On that account an oblique shoulder proves a most valuable asset in cart horses as well as in those of light breed, for a long-striding and active walk is greatly to be desired in the former, in view of their having to perform their work wholly or mainly at a walking pace. It also saves their legs from wear when used for draught work in towns or on the road. One does not expect to see the same degree of slope in the shoulders of cart horses as in the case of light-legged ones; that is neither necessary, nor would it be feasible to attain, the cart horse type being what it is. What in horses of the light class would be considered as an unduly straight shoulder might in a cart horse be quite sloping enough to meet the most exacting requirements. Beyond the advantages just noted, which undeniably are vital ones, it would not appear that sloping shoulders alone enhance a cart horse's powers of draught, or that they are in that particular respect superior to more upright ones, for when they throw themselves into the collar in drawing heavy loads horses have always to straighten their shoulders. Therefore an upright shoulder-blade does not place a heavy draught horse at any mechanical disadvantage in hauling a load. While everyone in this country is agreed that oblique shoulders are in every way desirable in draught horses, on the Continent they very generally consider that our Shires and Clydesdales are unnecessarily sloping in their shoulders; and they prefer to see rather more upright ones in heavy cart horses. When last year a party of members belonging to the Agricultural Society of Germany visited England and Scotland the sloped shoulders and pasterns they saw in Shires and Clydesdales elicited qualified approval, whereas we, of course, consider these to be among their best points. What struck them most in connection with the Shires probably was their free-striding and active walking action, which they considered very remarkable in such heavy and massive draught horses. Apparently they failed to appreciate the intimate relationship existing between this latter feature and an oblique position of the shoulder, as well as of the pastern.—Argus in Farm and Home.

Colts the First Season.

The pregnant mare should be watched very carefully and cared for during the winter months so that her system will be in first-class condition for the strain to be put on her at foaling and for the few months to come. I keep my mares at light work during the months they are growing the unborn foal. They are never asked to travel over deep snow or soft land, or are they asked to hit a fast clip on the road. They draw the milk cutter or sleigh at a good walk or slow trot, haul light loads of wood and the manure sleigh. They are kept well shod to avoid slipping.

Their food consists of well-cured hay, either mixed or timothy with whole oats, corn in the ear and wheat bran. This is divided according to my own notion. There are various rules for feeding that are very good. I never feed over 20 pounds of hay a day, and that depends on the weight of the horse. The water that a pregnant mare drinks should have the chill removed and she should never

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'SC ONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevets the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunche sof all kinds.

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR:--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR:--I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.
Hillsboro, N. S.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN:—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS:—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

Dollar Bottle Free

Send for a bottle of my Veterinary Medical Wonder. Cures Colic, Fever and Inflamation, Sent postpaid upon request. Agents wanted.

DR. BELL, V. S.
Kingston, Ont.

Full line of veterinary remedies in stock including Dr. Bell's Wonder, fine blister for Spavins, Ringbones, lumps or bunches of any kind.

ABSORBINE

Removes Bursal Enlargements, Thickened, Swollen Tissues, Curbs, Filled Tendons, Soreness from any Bruise or Strain; Cures Spavin Lameness, Allays Pain. Does not Blister, remove the hair or lay up the horse. $2.00 a bottle, delivered. Book 1 E free.

ABSORBINE, JR., liniment for mankind. For Synovitis, Strains, Gouty or Rheumatic Deposits, Swollen, Painful Varicose Veins. Allays Pain. Will tell you more if you write. $1 and $2 per bottle at dealers or delivered. Manufactured only by W. F. YOUNG, P.D.F., 124 Lymans Bldg., Montreal, Ca.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

MORE POTATOES PER ACRE

Do you want to increase your potato crop 10 to 57 bushels per acre and thereby increase your profits $5 to $57 per acre?

The Iron Age Planter is the one machine with which an absolutely perfect stand can be obtained. At the Maine Experiment Station the yield where the

IRON AGE

was used was 57 bushels per acre more than where one of the best of the "Picker" machines planted. It makes no misses, no doubles, injures no seed

In Idaho, Herbert Lambing, a former Iowa Agricultural College student, has gained attention by his big crops, due to scientific methods. He writes in part; "The *Iron Age* means just one half my crop this year." Let it secure for you a perfect stand, a bigger yield and more profit. Ask your dealer to show you the Iron Age Planter, with or without fertilizer attachment. Write us for special booklet and Mr. Lambing's complete letter. Both will interest you. This planter is but one tool in our complete line of Iron Age farm and garden implements. You should know them all.

Ocean Limited Early on Route.

SUMMER TIME CHANGE ON INTERCOLONIAL RAILWAY JUNE 2.

The summer change of time on the Intercolonial Railway will go into effect on June 2nd, when the famous Ocean Limited will be placed on the route between Montreal, St. John, N. B. and Halifax, N. S. with connections for and from the Sydneys and Prince Edward Island in anticipation of an early rush of summer travel. The time schedule is expected to be practically the same as last year which means that the "Limited" will leave Montreal at 7.30 p.m. reaching Levis at midnight, and giving through passengers the opportunity of seeing the famed Matapedia Valley during the earlier hours of the morning and a view of the Restigouche River and the blue waters of the Baie des Chaleurs. The beautifu, valley of Wentworth, N. S. will be seen in the more mellowing light of early eventide, and the train will reach Truro at 8.00 o'clock connecting with the through night express for the Sydneys and arriving at Halifax at 10.00 p.m.

The Maritime Express under the summer schedule will leave Montreal at 8.15 a.m. and through passengers will have the daylight journey through Quebec, and a view of the majestic St. Lawrence as it widens in its course to the sea. Making connection at Moncton with morning express for St. John the Maritime continuing eastward will reach Halifax at 13.30.

The Ocean Limited will leave Halifax westbound at 8.00 a.m. and the Maritime Express will leave as usual at 15.10 thus there will be a through week day service by two trains equal to the best ob the continent.

have over 12 quarts at a time. Ice cold water will cause abortion many times. I watch the mare very closely after the wax shows on the teats without appearing to do so, as some mares object to close attention at this time. A mare, when everytning is normal will foal, as a rule, in 20 to 30 minutes from the time labor pains commence. But if the foal is large and the mare weak, she will become exhausted just at the time when the head has appeared in sight. In a case of this kind the foal needs to be grasped by the limbs and pulled quickly into the world or it will be strangled in less than five minutes. If it is born and the placenta membrane is still on the end of the nose it will smother unless it is quickly removed.

Again, when the foal is born with the hind feet first, help will be needed or in most cases the foal will be lost. It is not, as many suppose, necessary for every foal to die that is born with the hind feet first. They die because birth is too prolonged. Aid of the proper kind by the person in charge will generally save the foal. When a mare is within one to two months of foaling, do not let her roll. Give her a chance to gnaw the earth 20 or 30 minutes a day and slow exercise. Too much grass might unbalance her first milk and cause bowel trouble with the foal. See that the foal drops on a nice clean bed of straw. Wet the navel cord with same antiseptic if it severs of its own accord. If it does not sever, tie it about an inch from the abdomen and sever an inch from the tie, then wet it as I said before. This will prevent septic poison of the blood and joint ill. Use for this one teaspoonful of carbolic acid in one-half pint of water.

Do not turn the colt and its dam out in the hot sun too long the first few days of the colt's life; gradually increase the time until they are running out all the time, provided they have a good box to run in out of the bad weather. Fresh air and exercise are all-important in producing healthy, growthy young horses. They will not amount to much if kept in a box with no exercise to grow bone and harden the muscles. Let the colt have a little feed box of its own, large enough to spread the feed out thinly on the bottom, and as soon as it will eat feed, give it all it will clean up with a relish, but no more. I always use ground oats and bran equal parts for the foal and its mother for a while after foaling.

For seasoning horse feed I use a dessertspoonful in every feed of the following; Common salt, two pounds; charcoal, one-half pound; powdered gentian, four ounces. For colts I add fine bone meal one-half pound. Give the colt a teaspoonful in feed twice a day. Watch the colt's feet and keep them rasped or pared. Many a horse has poor feet through life be being neglected when young. The most successful horse breeders feed their colts well and give plenty of exercise through colthood, and by so doing realize a good profit as well as does the horse industry by this same act. —Jay F. Hammond, Tompkins Co., N. Y.

Scratches.

J. B. D., Kings Co., N. B.:—I have a driver suffering from a slight kind of scratches in the heels. It is not through neglect, but just through ice and snow. Have used all sorts of salve and vaselines, but fail to cure it. The fetlocks keep breaking out in clusters of scabs and directly one lot disappears, another lot comes. Do you think there is any cure? I have washed them regularly with warm water, but all of no use.

Ans.—Scratches is a derangement of the blood. Treatment: Give a ball composed of Aloes and follow up with a condition powder and clip the hair from the legs that are affected. Use hot water and poultice with linseed meal and use zinc sulphate and lead acetate, one ounce each in a pint of water. Apply on the affected parts and keep the parts soft with glycerine.

Gombault's Caustic Balsam

The Worlds Greatest and Surest
Veterinary Remedy
HAS IMITATORS BUT No COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for

POULTRY.

Mating Fowls for Egg Production.

In common practice mating for egg production deals only with a few essential characters. Whatever the type or variety, when eggs are the special object the male should be an active, vigorous bird, and one that grew quickly and matured a little earlier than the average for males of his race. He should be of at least average size or, in a variety having a standard for weight, should closely approximate that weight. The hens should be selected for the same points, except that, as each hen influences only a small proportion of the offspring, and the mating ratio is usually made as wide as possible, it is not so necessary to give special attention to the point of early maturity in individual cases. If the mating is made, as it should be, before February, any pullets that are then well developed and laying may be used with reasonable assurance that the proportion of slower-maturing birds is not large enough to materially affect the general result, provided the male is not one that developed slowly. The matter of size is more important in selecting breeders to produce layers than in selecting layers. Slightly undersized hens often lay as well, or better, than larger hens, and lay as large eggs. A male a little under size may give offspring not notably smaller than those of a somewhat larger male, but the continued use of breeders of less than average size for their kind quickly reduces the average size of the stock. Even with care to use only birds not below medium size, the proportion of smaller stock is usually larger than desirable. Many poultry keepers who are indifferent to this point in mating offset their error by careful selection of the eggs set, taking only such as are of good size, form, and color. When only a small proportion of the eggs are to ient and economical way to select; be set, this may be the more convenbut since the hens of medium size, or larger, are usually the hens that lay the kind of eggs selected, it is better, when the object is to get as large a proportion of selected eggs as possible, to exclude small birds from the matings.

Good Egg Layers.

Editor Maritime Farmer:—

I noticed a letter in your valuable paper of March 21, 1911 concerning the Ottawa Experimental Farm report on the egg laying capacity of the poultry raised there. I may say that V. P's. letter expressed my sentiments exactly in regard to the small average of eggs gathered.

I have had only a short experience in the poultry business and only on a very small scale, but it has been more successful as far as average goes, than the report shows.

I started a flock of poultry by purchasing a brood of chicks which were hatched the middle of September 1909. The hen, evidently not believing in the theory that late hatched chickens are undesirable, had stolen her nest and hatched nine chicks, three of which were pullets, which I have kept. They all began laying before they were six months old, and within a year from the time they commenced laying, one of them had laid 208 eggs another 195 and the third laid 138 eggs and hatched and reared two broods of chicks. Twelve of these chicks were pullets, the younger ones being hatched August 1st. These twelve pullets and the three yearling hens laid 339 eggs in March. One of the pullets had laid 4 eggs when she was five months old, their average age on beginning to lay being less than six months, the younger pullets laying quite as well as those hatched earlier; the older ones laying more at the time when eggs were scarce and the price high.

By inserting this letter in your paper, you may induce others with more experience and perhaps greater success, to give your readers the benefit of their experience, and convince V. P. and others that poultry raising may be engaged in, in Nova Scotia with success and profit.—F. Harvie, Hants Co., N. S.

Better Eggs.

Ten per cent. of all the eggs sold during June, July and August are 'rotten,' while 35 per cent. are 'seconds.' These 'rots' and 'seconds' represent an average loss of $1.05 on every case of eggs which the farmer sells. A large part of this loss can be stopped if the farmer will follow these suggestions in handling his eggs:

1. Don't keep mongrel stock.
2. Don't hatch your next winter's layers after June 1.
3. Don't allow the male birds with the flock after you are through hatching.
4. Don't compel the hens to make their nests in the weeds and under the buildings. Provide one nest for every four hens.
5. Don't allow the nests to become filthy.
6. Don't set hens where other hens can lay in the same nests.
7. Don't wait until ready to go to town before gathering the eggs. Gather them at least twice a day during hot weather and on rainy days.
8. Don't keep eggs in a damp place.
9. Don't keep eggs in the kitchen, or near a fire of any kind.
10. Don't sell eggs that have been gathered from a stolen nest. Such eggs should be used at home.
11. Don't wash eggs.
12. Don't expose the eggs to the sun's rays when taking them to town.
13. Don't sell eggs case-count, but demand that your eggs be candled.
14. Don't market eggs which have been in an incubator.
15. Don't keep eggs in a tight vessel of any kind.
16. Don't keep eggs near oil, onions, etc., as they readily absorb odors.
17. Don't market the extra large, small, or dirty eggs. Use them at home.
18. Provide sufficient feed and shell for your hens at all times.
19. Keep your eggs in clean cases and fillers, with excelsior on the top and bottom of each case.
20. Male birds have no influence on the number of eggs laid.

Bee-Keepers Attention.

Editor Maritime Farmer:—

Bee-keepers in the Maritime Provinces will be pleased to learn that at the 1912 St. John Exhibition, the prize list of which will soon be in the hands of the public the class for bees and bee products will be more extensive than ever. Mr. H. A. Porter, manager-secretary, has guaranteed his assistance and we have already in our hands more special prizes than ever appeared in any Exhibition Premium Book in the United States or Canada.

We hope all interested in bee-keeping will unite in making the Show a grand success.

Send your entry early and meet us at St. John.—Todd Bros., Charlotte Co., N. B.

3 FEEDS FOR ONE CENT

We Positively Guarantee

That a 25-Pound Pail of

International Stock Food

Will Save You $7.00 worth of Corn or Oats

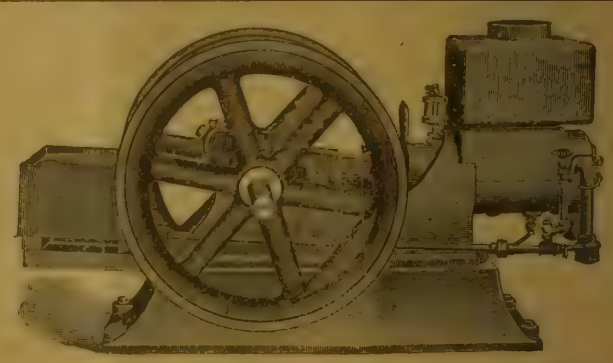
Because it promotes digestion and assimilation, and enables you to cut down the grain ration 15% to 25% and still get better results. This saving of grain represents a saving of good hard cash to you.

WE WANT YOU TO FEED 100 LBS. AT OUR RISK

It will not cost you a cent if you are not satisfied.

See our dealer in your town or write us for particulars. Mention this paper and the stock you own and we will send you a litho, size 16x22, of our three champion stallions.

International Stock Food Co. Limited, Toronto



The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will developmore power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

THE WATERLOO GASOLINE ENGINE CO.

J. D. FRIER, Sussex, N. B., Eastern Representative.

Poultry Pointers.

Coax the hens with good homes and good feed.

Don't expect good returns when you are giving indifferent care.

No successful poultry plant was ever built up with mongrel stock.

Never cover eggs up tight while you are holding them. Give them plenty of fresh air.

Feather-eating may be stopped by giving more meat scraps. It is worth while trying.

Linseed meal is a good feed for hens, but do not feed too much at a time.

BAD BLOOD CAUSES BOILS and PIMPLES.

Get pure blood and keep it pure by removing every trace of impure morbid matter from the system.

Burdock Blood Bitters has been on the market about thirty-five years, and is one of the very best medicines procurable for the cure of boils and pimples.

PIMPLES CURED.

Miss J. M. Wallace, Black's Harbor, N.B., writes:—"About five years ago my face was entirely covered with pimples. I tried everything people told me about, but found no relief. At last I thought of B.B.B. and decided to try a bottle. After finishing two bottles I was entirely cured, and would advise any lady who wants a beautiful complexion to use B.B.B."

BOILS CURED.

Mrs. Ellsworth Mayne, Springfield, P.E.I., writes:—"My face and neck were covered with boils, and I tried all kinds of remedies, but they did me no good. I went to many doctors, but they could not cure me. I then tried Burdock Blood Bitters, and I must say it is a wonderful remedy for the cure of boils."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

MAXWELL'S "PURITY" FOOD-CUTTER

is entirely different from the ordinary food chopper. The barrel is in two closely fitting sections, clamped together by one set-screw. Canadian made machine.

Better in quality, capacity and price works better, better finished, less in price. Five different cutting plates.

"MAXWELL'S PURITY" is the only food cutter made in Canada—and in ease, convenience, perfect cutting and durability—is superior to anything imported. If your dealer does not handle "Maxwell's Purity" write us.

DAVID MAXWELL & SONS, St. Marys, Ont.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

Abandon the Roosting Closets.

In the curtain front type of house a feature of the original plan on which considerable stress has been laid was the canvas curtain in front of the roosts. This curtain, together with the back wall of the house and the droppings board under the roosts formed a closet in which the birds were shut up at night during cold weather.

When the curtain-front house was first devised it was thought essential to provide such a closet to conserve the body heat of the birds during the cold nights when the temperature might go well below zero. Experience has shown, however, that this was a mistake. Actual test shows that the roosting closet is of no advantage, even in such a severe climate as that of Orono. On the contrary, the birds certainly thrive better without the roost curtain than with it.

It has been a general observation among users of the curtain-front type of house that when the roost curtains are used the birds are particularly susceptible to colds. It is not hard to understand why this should be so. The air in a roosting closet when it is opened in the morning is planly bad. The fact that it is warm in no way offsets physiologically the evils of its lack of oxygen and excess of carbon dioxide, ammoniacal vapors and other exhalations from the bodies of the birds.—Prof. Raymond Pearl, Orono, Maine.

Eggs a Dollar a Dozen.

"VIRGIN EGGS FOR INVALIDS sold on physician's prescription only. Special attention paid to the feeding of chickens to assure the purest and most nourishing albumen. Price $1 per dozen. LAWRENCE EGG FARM."

The above advertisement occupies considerable space in New York medical journals that go to doctors. We understand that this party is not able to supply the demand for "virgin" eggs at a dollar a dozen. By virgin eggs is meant eggs from hens that have always been kept apart from the rooster. Such hens are fed with the best food, especially alfalla, beans, peas, soja beans or other vegetable foods rich in protein or albumen. They also get some meat, but care is taken that it is fresh meat, free from decay or disease of any kind.

"P. E. I. Poultry Men"

The P. E. I. poultry men held a good meeting at Summerside during the Seed Fair. Mr. Frank Glydon occupied the chair and Rev. Dr. Gauthier, D. M. McDonald, J. E. Wyatt and others addressed the audience. In the course of his remarks Dr. Gauthier said that in his experience the chief essentials of successful poultry production are plenty of air, light and good feed, approximating as closely as possible to the food attained by the hens in summer. He fed with sprouted oats and other grains, mangles, turnips, clover, cabbage, and other food of like description. He laid great stress upon the wealth, the hen brought to the country, and remarked that, instead of an eagle the United States ought to have selected a hen for their coat-of-arms, for the revenue obtained from United States poultry is more than that obtained from any other single source.

1912 CONTEST

COUNT THE Xs AND Ts

$100.00

GIVEN AWAY

And many other prizes according to the Simple Conditions of the Contest (which will be sent).

This is a chance for clever persons to win Cash and other Prizes with a little effort. Count the Xs and Ts in the Square, and write the number of each that you count neatly on a piece of paper or post card and mail to us, and we will write you at once, telling you all about it. You may win a valuable prize. Try at once.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Be a Booster.

Do you know there's lots o' people
  Settin' round in every town,
Growlin' like a broody chicken,
  Knockin' every good thing down?
Don't you be that kind o' cattle,
  'Cause they ain't no use on earth,
You just be a booster rooster,
  Crow and boost for all you're
    worth.

If your town needs boostin', boost'er;
  Don't hold back and wait to see
If some other fellow's willin'—
  Sail right in, this country's free.
No one's got a mortgage on it,
  It's just yours as much as his,
If your town is shy on boosters,
  You get in the boostin' biz.

If things just don't seem to suit you
  And the world seems kinder wrong,
What's the matter with a-boostin'
  Just to help the thing along?
'Cause if things should stop agoin'
  We'd be in a sorry plight;
You just keep that horn ablowin'—
  Boost'er up with all your might.

If you know some feller's failin's,
  Just forget 'em, 'cause you know
That same feller's got some good
    points,
  Them's the ones you want to show.
"Cast your loaves out on the waters,
  They'll come back" 's a sayin' true,
Mebbe, too, they'll come back "but-
    tered"
  When some feller boosts for you.

Love's Barrier.

(Continued from last issue).

CHAPTER XX.

THE TRYST.

"Admirable," murmured Hunt with a curious inflection in his voice. "Admirable. You have certainly missed your vocation, Helen. Another Rejane or Bernhardt undoubtedly has been lost to the world."

Helen played a few more notes, and not one rang false.

"Come round to the other side," she said in a low, quite clear voice. "I have something to say."

Hunt obeyed her at once, his pulses thrilling a little with the piquancy of the moment, and with a feeling that was something deeper. He had not forgotten this woman, and he knew now as he looked at the exquisite poise of her head, the sensitive outline of her beautiful face, that he never would forget her. He had met nothing to compare with her since they had parted three years ago.

"What did you mean to-night?" he asked in a low tone that had a touch of passion in it. "Why couldn't you say quite frankly that we had met before? It would have been much easier for us both."

She played on, her eyes dwelling with strange intentness on his face.

"I had my reasons," she answered at length. "But I can't give them here. I have something to say to you. Find out where the Low Ghyl in Mardocks Wood is, and meet me there to-morrow afternoon at three o'clock."

"I shall have a job getting out, but I shall be there, Helen; thank you very much."

"Pray don't thank me, you will not have any occasion," she answered, and bringing the bar to a sudden and crashing conclusion, she rose from her seat and glided away. "Claude, dear, I think I should like to go now if you are quite ready," she said when she was half across the room. At the moment the servant appeared to say that the carriage was at the door.

The adieux were quickly made, and Geoffrey Hayes was the only person who observed that Mrs. Secretan and Major Hunt did not shake hands. He dismissed the incident, however, concluding that it only marked the difference between the manners of what his wife called the lower and the upper ten. Undisguised frankness in all the relations of life is the particular privilege of the poor, and has its advantages.

"Don't you admire Mrs. Secretan, Gerald?" asked Audrey as she hovered about her lover the moment the door closed. "She seems out of sorts to-night, and I'm afraid she didn't like you, Gerald. It is not like her to be cold like that."

"Nonsense, Audrey, you know that Mrs. Secretan could never by any chance be called a gushing person. She has a way of looking at people as if she had no further use for them. I've seen her look like that," said Gerald—and immediately corrected himself—"more than once to-night; downstairs, she did. But, by Jove, can't she talk, and to some purpose too!"

"You like the Rector, I am sure?" said Mrs. Hayes eagerly.

"Yes," answered Hunt. "He seems a very decent sort of a chap, but of course he's hardly a mate for her. It is quite obvious that she belongs to a different world."

Geoffrey Hayes returned at the moment from having speeded the parting guests at the door.

"Mrs. Secretan did not seem quite like herself to-night, I thought. You liked them, Gerald?" he said cheerfully. "We consider ourselves very fortunate in having such a Rector and his wife in Midcar. Wait till you hear him preach on Sunday morning. Undoubtedly his gifts are far above the place. But promotion is certain to come."

They continued to discuss the departed guests, Hunt in no way averse to hearing as many items as he could. It would help him on the morrow, for he had not the remotest idea what sort of an interview he was likely to have. The mere anticipation of it made the blood course faster through his veins. He loved intrigue, though he had imagined himself done with it. And he still loved Helen. The sweet flower-like face of the girl who was going to be his wife lost its appeal.

As the carriage drove away from the lighted doorway, Secretan turned anxiously to his wife, feeling her leaning somewhat heavily against him. He put his arms about her, and drew her very closely to his side.

"My darling, I'm afraid it has been too much for you. Are you very tired?"

"Not tired at all, Claude, but it was very dreary, don't you think? People should not invite strangers to family functions which really have no interest except for those immediately concerned."

Secretan looked the surprise he felt.

"They don't look upon us as strangers at High Ridges, surely. It was a compliment they paid us to-night, and I appreciated it to the full. Well, how did you like Major Hunt?"

"I hardly know. I had so little opportunity of judging, but I do think he is too old for Audrey. I would rather, oh, much rather, they gave her to John Ridd."

"You surprise me more and more. I formed quite a high opinion of him. He is far more intelligent than the average soldier."

"Why did you go back to the dining-room when Mr. Hayes came up to us?" she asked almost feverishly.

"We happened to be discussing missions in India, and I wanted to ask a few more questions. It is so seldom one obtains information at first hand."

Helen suddenly laughed a little shrilly.

"Missions! You discussed missions with that man! How awfully funny!"

"Why should it be funny? He has been on the spot for three years, and may be expected to know something about them. As a matter of fact he does know a great deal."

"And what was his verdict?" asked Helen in a voice of cold, faint amusement.

"He admits the good that has been done, but criticises some of the methods. I don't think you are quite just to him, Helen, and it is not like you to be prejudiced like that at the outset of an acquaintance. You won't let Audrey know you were not favourably impressed? I'm sure it would be very disappointing for her."

"What else did you talk about besides missions?"

"Oh, a good many things. He was very friendly and interested, and asked a lot of questions. I told him where we met, and how long we had been married."

"Claude, that was very provincial, and you had no right to discuss me with a strange man."

"I didn't discuss you. He admired you, of course, and I must say I never saw you look so brilliant. I don't understand you to-night, dear, and I'm afraid you are over-tired. There, there, don't say another word."

His amazing tenderness, which had a touch of protecting care in it, was round about her, and she gave herself up for the moment to his care. Her nerves were unstrung, her heart beating wearily, because of the load that oppressed it. The morrow loomed before her like a nightmare, but her mind was made up. Her duty was before her quite clearly, and would be undertaken at any cost to herself. She would not permit Gerald Hunt to take the pure sweet young life of Audrey Hayes into his keeping. He would call it revenge, of course, not being able to appreciate any other motive, and if there should be a price to pay she would pay it.

"Claude, may I ask you something?" she said suddenly.

"Why, yes, dearest, of course."

"Lately I've been thinking quite a lot about duty. You have taught me," she said in a low voice, "and all sorts of questions arise in my mind. If I had known you in the old days, how different it would all have been."

Secretan thrilled at the words, which filled him with a joy that was singularly pure and impersonal.

"Supposing a case arose," she went on without waiting for his answer, "where a person, by speaking out, could prevent what would be a wrong, do you think it would be that person's duty to speak out at whatever cost to himself?"

"I certainly do think so," he answered without a moment's hesitation.

"Even if it involved suffering and disappointment to quite a number of people?" she pursued anxiously.

"If the nature of the wrong were clearly defined, Helen, it would be easier to answer; but speaking generally, duty should come first."

"At any cost?"

"At any cost."

"But supposing it were to cost you personally something?"

"I hope that I should still have the courage, Helen. If our religion teaches us anything at all, surely it teaches that self should come last and not first."

"I have never known anybody who lived up to that ideal, except Jane, and a little way after her, you," she said quietly, even wistfully. "And I don't believe it is a universal or even a general rule of conduct. Most persons think of self first."

"Hence much of the misery of the world," he answered quite simply. "But why all this very grave ethical discussion. Have you a case in point?"

"It was something which happened long ago. If I had known then it would have been different."

Secretan had not a prying mind, and his confidence in his wife was supreme. Since she had given herself absolutely to him, his happiness was not only complete, but the spiritual side of him hah deepened, and become a more powerful as well as a more gracious factor in his life. Happiness undoubtedly brings out all that is best in us.

"Well, perhaps it is rather stupid to discuss such things late at night after a particularly dull dinner party," she said, rousing herself as they approached nearer the few twinkling lights of Midcar. "What time do you start out for Iffley tomorrow?"

"Immediately after lunch. If you could give it to me a little earlier, I

DOCTOR ADVISED OPERATION

Cured by Lydia E. Pinkham's Vegetable Compound

Canifton, Ont.—"I had been a great sufferer for five years. One doctor told me it was ulcers of the uterus, and another told me it was a fibroid tumor. No one knows what I suffered. I would always be worse at certain periods, and never was regular, and the bearing-down pains were terrible. I was very ill in bed, and the doctor told me I would have to have an operation, and that I might die during the operation. I wrote to my sister about it and she advised me to take Lydia E. Pinkham's Vegetable Compound. Through personal experience I have found it the best medicine in the world for female troubles, for it has cured me, and I did not have to have the operation after all. The Compound also helped me while passing through Change of Life."—Mrs. Letitia Blair, Canifton, Ontario.

Lydia E. Pinkham's Vegetable Compound, made from roots and herbs, has proved to be the most successful remedy for curing the worst forms of female ills, including displacements, inflammation, fibroid tumors, irregularities, periodic pains, backache, bearing-down feeling, flatulency, indigestion, and nervous prostration. It costs but a trifle to try it, and the result has been worth millions to suffering women.

should be glad. I always like to get back for tea, if possible, you know. You have spoilt me for all other tea tables whatsoever."

She hardly smiled.

"You shall have it just when you like, surely. The house is yours to order as you will."

He had never seen such humility in her, and as he helped her to alight at the door he peered anxiously into her face. It was very pale, and her eyes seemed shadowed. He voiced the immediate anxiety which took possession of him.

"I shall be all right to-morrow. Don't make a baby of me, Claude. I don't want to be spoiled, but to be a strong, self-reliant woman. All this is not good for me, though"—she added with a sudden quiver of the lip—"it is very sweet."

Secretan slept the sleep of the strong man, physically tired by a healthy day, and without a care on his conscience or his heart. He had not the slightest idea that his wife was up part of the night, sitting in her own sanctum with a thick dressing-gown about her, staring out in the moonless dark of the uncurtained window, longing, and yet fearing for the day.

She did not wish to undo what she had done nor to shrink from it. She was only conscious of a great, sad weariness and wonder at the hardness of fate. She had found shelter and anchorage at last, like a ship that had been beaten by wind and wave, and lo, the anchorage was not safe. She had not asked so very much, after all: only the chance to pursue her quiet way along the pathway of happiness and peace, that had opened so unexpectedly before her. She had married to escape, and without expectation of the good in store.

The year that had passed had been full of wonderful experiences for Helen Secretan; for the first time she had obtained a glimpse of the real meaning and purpose of life. Her whole being rendered plastic and easily influenced by gratitude and personal happiness, had risen to respond to the appeal to her higher womanhood. And now, just when life was at its fairest, lo, there came from out the past a dark shadow which threatened to engulf her.

Towards morning she crept back to bed, strangely strengthened by her communion with the night, and was able to sleep. But she was still pale when she appeared at the breakfast table, though Secretan did not find her less cheerful than usual. It was Friday morning, and he had to betake himself to his study without delay, so that Helen had her morning to herself. They met at their early luncheon, immediately after which Secretan set out on his bicycle to take an afternoon service for his neighbour at Iffley Bridge.

Half an hour later Helen, dressed in a walking coat and skirt, and carrying her shepherd's crook, left the house. She crossed a small section of the moor, and then branched off by a cart track which led to the woodman's entrance to the Mardocks Wood. At five minutes to three she reached the appointed trysting place, a lonely dell through which ran a turbulent stream which fell, a little higher up, over an overhanging rock, which scarcely, however, justified its somewhat ambitious name. Hunt was already there, leaning against the stump of a tree finishing a cigar, which he took from his mouth and threw away as he beheld Helen in the distance gliding through the trees. He wore a tweed shooting suit and a cap, which he raised and kept in his hand until she came out from the trees, and they were face to face on the little open space by the side of the stream. Her face was quite grave, and she ignored his outstretched hand.

"So it isn't true, Helen," he said lightly, yet with evident disappoint-

ment. "If you knew the trouble I've had to keep this tryst, you would be a little kinder to me."

"I won't keep you long," she said steadily. "I only wish to tell you that you cannot marry Audrey Hayes."

He slightly elevated his brows in amusement.

"And why, pray, since you have so quickly consoled yourself? Why is the same consolation barred to me, eh?"

The situation continued to pique and interest him, and though Helen looked less brilliant than she had done on the previous evening she had nothing to fear from the clear, searching light of day. She had not gone off at all, he decided, and she was always interesting; such a woman could never pall upon a man. He cursed the hard fate that had parted them.

"Look here, Helen, old girl, you've got your knife in me, and I don't altogether blame you, but you see as I was situated we couldn't go on. We couldn't live on my pay, the thing was impossible; I told you from the first that, while our dream was very sweet, it couldn't last. Things haven't turned out so badly for you after all. Your parson is a first-class chap, and from all I can hear you are a great success here, and quite happy. Why not comfortably bury the hatchet, eh?"

"I don't want to talk about the past as you seem to think, or to throw any reproaches at you," she said with a faint flicker on her features. "I have only come to tell you that you can't marry Audrey Hayes."

"In Heaven's name, why can't I? What do you mean? What are you playing for, anyhow? It's a poor, mean sort of spirit. Speak up, and tell me what you mean."

"She is too good for you. You would break her heart in less than a year," she said steadily.

"If I did," he replied, stung by her tone, "it is no concern of yours."

"It happens to be my concern. These people have been kind to me. The child herself is the sweetest thing God ever made. She is young, good, full of ideals which you would destroy one by one, leaving her nothing but the husks. At whatever cost to myself I will prevent it."

He stood looking at her steadily, reading in her clear, unwavering eyes, in the set expression of her tense features, an indomitable resolve. He shrugged his shoulders.

"And I," he said slowly, "am just as determined that nothing shall prevent it, and I think you will find that I am the stronger of the two. How do you propose to do it?"

She leaned for a moment against the trunk of a tree, and her eyes, wandering down the glade, had a far-off expression in them.

"I don't know what I may do, but I am giving you fair warning. It is open to you to withdraw of your own accord. It is her money you want, the money the lack of which made you leave me to be the sport and mock of a whole town."

He winced ever so slightly.

"I admit that I behaved badly. I admit everything, Helen, and I've often wished to write and explain and beg your forgiveness. But, as I said, I couldn't help myself. Don't bear malice, and do, if you can, give me credit for a little spark of the true thing. You are the only woman I ever really cared for or ever will care for," he added, watching her narrowly, but the deadly pallor of her face remained unrelieved. "But, honour bright, I will turn over a new leaf and make her a model husband. She won't be hard to satisfy. Happily she has the bourgeois mind."

Then, indeed, did the flame leap in Helen's cheek.

"It is intolerable to hear you. You have not changed one bit; you are the same cold, calculating, self-

MARVEL BLUING CO., TORONTO, ONTARIO, CANADA

You judge a man not by what he promises to do, but by what he has done. That is the only true test. Chamberlain's Cough Remedy judged by this standard has no superior. People everywhere speak of it in the highest terms of praise. For sale by all Dealers.

ish creature. No woman's happiness would be safe in your hands for one hour."

"We managed to steal a good few, Helen," he interpolated meaningly.

"More than ever I am resolved," she went on passionately, "that I will save Audrey from you."

Then his brief attempt at conciliation was swallowed in the flood-tide of his wrath.

"If you persist in this dog-in-the-manger policy," he said quietly, but with the sinister gleam deepening in his eyes, "I can act, too. There are always two sides to a story. And your parson chap is a man. It would not be very difficult to sow the seeds of discontent in him. You had better weigh it well before you wreck so many lives. Yours would be total wreck, I assure you. I would see to that."

The cold virulence with which he spoke did not turn her from her purpose. More than ever she felt that it would be impossible to give Audrey Hayes to this man. Going back in one swift retrospect to her own girlhood, she remembered the slow shattering of her own ideals, and how this man in front of her had taken away the final tottering steps from under her feet.

"I must pay the price," she said faintly, but with an equal determination.

At the moment something started in her eyes, a sheer terror which caused Hunt's eyes to follow immediately in the direction of hers.

Secretan, wheeling what appeared to be a disabled bicycle, came slowly towards them through the trees.

(Continued in next issue).

The Ideal in Every-Day Life.

Let us now go for a walk, during which we will observe the people who are pursuing their callings. Let us note their mood.

We shall come upon persons whom we cannot see sweep, hammer, or dig the earth without experiencing a desire to take from them their broom or hammer or spade in order to show them how they ought to use it. This sort of worker is to be met with quite as often in the schools, in the church, in the studios of painting and sculpture, as in the fields, the mines, and the shops. Without ideals the people are the same everywhere. When they teach, they make us weary of learning; when they make music, they cause us to hate music. They have no faith in their work. All the time they have the air of saying: 'What a stupid trade I have chosen! Be sure my children shall not follow it.'

Those who put the ideal into their work produce an altogether different effect on us, whether they be manual or intellectual laborers. You see them at work, performing at times unpleasant duties, which you, perhaps, would not choose, but with so much of good will, of punctuality, and fidelity, and such an appreciation of 'the useful flight of days' that they appear great to us, and an impulse seizes us to imitate them.—Charles Wagner, in Harper's Bazar.

Don't Forget That.

If your mother had thought more of herself and less of you she might be much fairer and fresher now, for she was once as good-looking as you are. She might wear better clothes even now, so that you might be proud to have your friends meet her, but remember that she mended her old clothes that she might make new for you. The wrinkles on her face, the care lines on her cheeks, and the weary looks in her eyes—all those scars are seals of her love for you.

NA-DRU-CO Tasteless Cod Liver Oil Compound

THE "building up" value of Cod Liver Oil is well known, but its drawbacks have been its nasty taste and indigestibility.

Na-Dru-Co Tasteless Cod Liver Oil Compound has the nutritious qualities of the Cod Liver Oil, without the slightest disagreeable flavor. In it the Oil is skilfully combined with Extract of Malt, Extract of Wild Cherry, and Hypophosphites, making a splendid tonic as well as a valuable food.

Na-Dru-Co Tasteless Cod Liver Oil Compound is particularly good for growing children who are puny or run-down.

In 50c. and $1.00 bottles, at your druggist's. 106

Don't miss this great opportunity.** Write to us at once. Address

THE DR. BURDICK MEDICINE CO., Dept. 109 Toronto, Ont.

Nonsense.

There is a great deal of nonsense palmed off on the community about the reaction of the child from over-strictness in parental training. When I hear a man says 'My parents brought me up so rigidly that a reaction took place in my mind, and I have turned away from religion.' I have sometimes asked, 'Did they teach you to be honest?' 'Yes.' 'To tell the truth?' 'Yes.: 'Were they strict about it)' 'Yes.' 'Has any reaction taken place on these points?' No man of us learns the multiplication-table from the sheer love of it; but I never knew any one to say that his mind was in reaction against the multiplication-table.—John Hall, D.D.

When we are alone we have our thoughts to watch; in our family, our tempers; and in society, our tongues.—Hannah Moore.

The Art of Visiting the Sick.

'From the tender mercies of our friends, good Lord deliver us!' sighed the invalid.

The nurse smiled as she deftly rearranged the pillows.

'Didn't you enjoy your caller?' she asked.

'Do you know,' observed the patient, with apparent irrelevance, 'that visiting the sick is an art which very few possess? I've noticed it especially since I've been convalescing. Now, Mrs. Carmichael, who just called is one of the best women who ever bored her friends and acquaintances, and I wouldn't for the world hurt her feelings by declining to see her. But do you know what her conversation was about to-day? She regaled me with a detailed account of her own typhoid experience; how she had a perforation, and dear knows what all. She had typhoid so much worse, according to her statement, and suffered so much more than I, that I really felt ashamed of myself for pretending to have it at all.

'There's Edith Sayres, who dropped in yesterday. Maybe you heard her greeting: "Well, aren't you having a fine time tucked up here with a nurse to wait on you while the rest of us poor mortals are bothering with dressmakers and milliners. You look so well that I believe you've been pretending to be sick to get a little rest."

'Of course it was foolish of me, but I could have cried I felt so hurt, although I knew at the time it was just her idea of being cheerful. She wasn't as bad as Aunt Agnes, who told me I looked dreadful, simply dreadful. Her husband's sister had typhoid and when she thought she was nearly well she died, leaving five little children. She was glad I had gotten through so far, but I must remember I wasn't out of the woods yet. Then it was a pity I had been sick, for it had been such an expense to father, having the nurse and the doctor's bills. It was kind of them to keep my place at school for me, but they were likely to give it to someone else any time, for there were such lots of teachers wanting positions. I had a good cry after she left I felt so depressed.

'Cousin Margaret thinks that any old thing in the way of clothes is good enough to visit the sick in, and though she has some real pretty dresses, she'll come flying in here looking so mussy that it makes me nervous.'

'Well,' commented the nurse, with a smile, 'isn't there anyone of your friends who has the art of visiting the sick?'

'Is there,' repeated the invalid, haven't you noticed for yourself how much good Dorothea Kent's calls do me? They are better than a tonic. She's always dressed so carefully that it's a pleasure to look at her. Her voice is quiet and nicely pitched. It isn't loud nor yet that horrible sick room whisper that sets your nerves on edge. She saves up every bit of news she can think of to tell me, and at the same time doesn't make me feel that I am missing a lot of good times. I always hear through her who has inquired after me, and it is pleasant to know you're remembered when you're out of the world. She doesn't hurry off after a short visit, and she doesn't stay long enough to tire me. I suppose the whole secret is tact, and that she does possess more than her share of it.

'Probably the doctor knows what he is about when he sometimes shuts out all visitors, but there are all varieties of callers, and some are as undoubtedly tonics as others are depressants.—Presbyterian Banner.

A Cheerful Home.

A single bitter word may disquiet an entire family for a whole day. One surly glance casts gloom over the household, while a smile, like a gleam of sunshine, may light up the darkest and weariest hours. Like unexpected flowers; which spring up along our path, full of freshness, fragrance and beauty, do kind words and gentle acts and sweet dispositions make glad the home where peace and blessing dwell. No matter how humble the abode, if it be thus garnished with grace and sweetened with kindness and smiles, the heart will turn lovingly toward it from all the tumult of the world, and it will be the dearest spot beneath the circuit of the sun.

And the influences of home perpetuate themselves. The gentle grace of the mother lives in the daughter long after the head is pillowed in the dust of death; and the fatherly kindness finds its echo in the nobility and courtesy of sons who come to wear his mantle and fill his place; while on the other hand; from an unhappy, misgoverned, and disordered home, go forth persons who shall make other homes miserable, and perpetuate the sourness and sadness, the contentions and strifes and railings which have made their own lives so wretched and distorted.

Toward the cheerful home the children gather 'as clouds and as doves to their windows,' while from the home which is the abode of discontent and strife and trouble they fly forth as vultures to rend their prey.

The class of men who disturb and distress the world are not those born and nurtured amid the hallowed influences of Christian homes; but rather those whose early life has been a scene of trouble and vexation—who have started wrong in the pilgrimage, and whose course is one of disaster to themselves, and trouble to those around them.—Friends Intelligencer.

A Mother's Rules.

Things which I must teach my little girl:

That if you must choose, it is better to be a beautiful home-maker than a fine housekeeper. Then, for instance, ruffled pillow-cases cost too much if they mean ruffled tempers.

That the one indispensable quality in a home is happiness; every home, no matter how beautiful, which misses that, is a failure; but no home, whatever its faults, can be wholly a failure if it is happy.

That happiness is a matter of spirit, not 'things.'

That it is possible only when every member of the household is considered, and all work and plan together, and God is its constant Guest.

That, to be in her own place where ever that may be, a beautiful home-maker is the loveliest ambition a woman can have.

These are things that I want to help my little girl to understand.—Christian Globe.

Children are much more likely to contract the contagious diseases when they have colds. Whooping cough, diphtheria, scarlet fever and consumption are diseases that are often contracted when the child has a cold. That is why all medical authorities say beware of colds. For the quick cure of colds you will find nothing better than Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all Dealers.

WATCHES GIVEN AWAY

EVERY BOY AND GIRL NEEDS A WATCH
BOTH HANDSOME PRESENTS FREE

BOYS This watch is a dandy. Regulation man's size and weight. Your father would be proud to carry it. Stem wind and set. Arabic dial. A good Timekeeper. Guaranteed.

GIRLS You won't envy any lady in your neighborhood if you have one of our lady's watches—small, neat shape, new model, stem wind and set; highly finished, milled edge. arabic dial, thoroughly charming timepiece. Guaranteed good Timekeeper.

Now it's very easy to get one of these beautiful timepieces. Just write us to send you $4.00 worth of our quick selling Easter and Assorted Post Cards and sell them to your friends at 6 for 10c. Your friends all buy Post Cards somewhere, why not ask them to buy from you.

Then when you have sold them—send us the money and we will promptly send you one of the watches. It's very easy, just try it once.

L.C. writes "I have found them very easy to sell," R.J.G. writes "I have sold all the cards you sent me, so I think I will try another lot." J.B. writes "I sold them all in a few days." So you see others can easily do it—why not you?

We are sending presents to Boys and Girls all over Canada every week. Be sure to write to-day. Don't forget you have nothing to pay. Watches delivered free to destination.

OVERLAND MERCHANDISE CO., Dept. 31 TORONTO

RU-BER-OID Roofing
TRADE MARK REGISTERED.

Gives Most Protection Per Dollar of Cost

RU-BER-OID'S cost per roll is moderate. The cost of laying is very small, as skilled labor is not required. The only upkeep cost is a coat of RUBERINE Cement every three or four years.

RU-BER-OID is weather-proof, not affected by acids, fumes, gases or extremes of heat or cold, and strongly fire-resisting.

This complete protection has lasted, in the case of the first RU-BER-OID Roofs laid in 1891, for 21 years—and these roofs look good for many more years of service.

Our Booklet, "RU-BER-OID—Why?" explains why RU-BER-OID costs least per year of service. If you are interested in roofing, write for it, and for samples of RU-BER-OID, made under Canadian Patents 93,027 and 93,160, in Colors—Red, Brown, Green—and in natural Slate.

THE STANDARD PAINT CO. OF CANADA, LIMITED.
MONTREAL. WINNIPEG. VANCOUVER. 89

HARROWS We talk big on our Lever Harrow because we know its value. Got the conclusive evidence from the right sources—our own experience and the men who use them.

Material—We couldn't buy better if we paid double the price.

Teeth—High Grade Steel, tempered in oil by experts and thoroughly tested.

Adjustment—Just a movement of the levers in the field and the teeth are set in an instant to any depth as the work requires it.

Work—The Bailey-Underwood Lever Harrow will do more effective work than any other Spring Tooth Harrow on the market and do it in less time.

Made in sizes 9 and 11 Tooth, Single Section. 15 and 17 Tooth, Double Section.

BAILEY-UNDERWOOD CO., Limited New Glasgow, N. S.

NO STEEL BOUNTIES

The Sarnia Fence Company's Petitions are Effective with the Government.

Sarnia, March, 15th—No doubt it will be gratifying to every farmer who signed the Sarnia Fence Company's petitions against the renewal of the steel bounties, to learn that they have been effective with the government. It goes to prove what a power the farmers are if they will only unite and stick together. The Sarnia Fence Co. sent out 25,000 of these petitions, and the great majority of them reached Ottawa; five hundred thousand farmers told the government that they would not submit to be taxed in favor of a few capitalists. The government realize that the farmers are united in this matter, and the result is that you are relieved of this unjust tax for the present. You must bear in mind, however, that government aid, is too rich a plum for the steel interests to let slip without a fight, and they are now making statements to the effect that the opposition to the steel bounties is the work of some New York Steel Corporation, who do not want to loose their Canadian market. This is absolutely untrue; the Sarnia Fence Company is a strictly Canadian Company operated on Canadian soil by Canadians with Canadian capital. This statement is made by the steel interests with the desire to, if possible, counteract the effect of the petitions sent to your member. Without question the steel interest will make strenuous efforts to induce the new tariff commission (which the government propose to appoint) to give them increased protection in the form of additional duty on all iron and steel products, especially fence wire and wire rods. The Sarnia Fence Co., propose to present to the tariff commission the farmers' side of the situation, and if possible persuade them to give the steel interests no further protection at the expense of the farmer. This is a matter in which you are vitally interested, whatever amount of duty or protection which is put on wire must be paid by the farmer as the price of fence must be increased whatever the duty amounts to. Now the Sarnia Fence Company cannot accomplish this without the support of the farmer, and we want you to keep the matter before you and at every opportunity state your views to your member, give him to understand that if he does not oppose the giving of a bounty on all steel and iron products or the placing of a duty on fence wire or wire rods, that you will resent it and if he will oppose this in the interests of the farmer he will have your support. Don't let party politics influence you in this matter, by uniting and standing together against this injustice you will receive proportionate consideration at the hands of the government.

We have decided to continue our special cut prices on Royal Fence for the balance of this season or up to July 1st 1912.

Yours very truly,

The Sarnia Fence Co., Limited,
SARNIA, ONTARIO.

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all Dealers.

Some Valuable Bulls and a Valuable Advertising Medium.

Editor Maritime Farmer:—

Enclosed you will find change of copy for our advertisement. We have just returned from Ontario with a few head of Holsteins. Among the lot are a few bulls, fit for service, which we are offering for sale. One is a son of Vida Princess 4th, record of 18,482.75 pounds milk, 753.3 pounds butter in 1 year in the Record of Performance and sired by a son of Netherland Aaggie DeKol, R. of P. test 21,666 pounds milk and 881 pounds butter in 1 year, making his two nearest dams average 20,074 pounds milk and 817 pounds butter in 1 year. This fellow is mostly white and a fine individual.

Another dandy is a son of Aaggie Schuiling DeKol, R. of P. test at two years old, 13,283.5 pounds milk, 512.67 pounds butter, whose sister Netherland Aaggie DeKol, has a record of 21,666 pounds milk and 881 pounds butter. This bull is sired by Woodland Sarcastic Lad, whose dam has a record of 18.47 pounds butter in 7 days.

We also have a son of Calamity Teake DeKol, R. of M. test, three months after calving 17.33 pounds butter from 373.39 pounds milk and R. of P. test of 12,715.75 pounds milk in 10 months and 10 days at 2 years and 2 months old. Her fat has not yet been figured by the Department, but her test is around 3.7 per cent. The sire of this bull is Lady Schuiling 3rd's Posch,

With the breeding back of these bulls we see no reason why they should be long on the market.

To head our own herd we got Royalton Canary Major, a son of Royalton DeKol Fern, official record at 5 years old of 34.60 pounds butter and 111 pounds milk in 1 day. Royalton DeKol Fern's dam has a record of over 20,500 pounds milk and over 880 pounds butter in one year.

Royalton DeKol Fern and three of her sisters average over 112 pounds milk in 1 day. They are all running in the yearly test and it is expected that they will make some records.

Royalton Canary Major is as well bred on his sire's side as he is on his dam's. We are looking for something good from him, when bred to daughters of Helbon DeKol's Prince, whose dam has a record of 31.54 pounds butter in 7 days and 30 day record of 128.67 pounds butter.

Our stock is looking fine now. The cows have milked well all winter, averaged over 40 pounds a day for everything that is in milk. Sales have been very good, a few of them are: 1 yearling bull. to Nathan Smith, Hillsboro, N. B.. This bull is a full brother to the three year old that won the cup at Amherst in the dairy test; One heifer to Stewart Etter, Shubenacadie, 1st prize winner in the test at Amherst; a fine bull to Duncan Chisholm, Glassburn, N. S.; the cow Lilac and calf to R. R. Wannamaker of Nauwegewauk, N. B.; a two year old bull to D. R. Nicholson, Coxheath, C. B.; a fine yearling bull to D. A. Higgins, Fort Lawrence, N. S.; a very fine three year old heifer to Frank S. Whitman, New Albany, N. S., this is a sister of the cow that won the milk test at Guelph this year. Also a nice cow to Judson Archibald, Alma, N. S. and a very fine bull to R. H. Putnam & Son, Lower Onslow, N. S. This is one of the finest bulls that we ever handled. He has three dams in his pedigree that average over 23,000 pounds milk in 1 year and is the making of a crack show bull.

We get a lot of inquiries stating that they saw our Advertisement in the Maritime Farmer. It seems to be the place to get in touch with the buyer.—Samuel Dickie, Central Onslow, N. S.

Try the flour that holds the confidence of thousands of home-cooks

THE present huge demand for PURITY FLOUR shows the confidence in which it is held by thousands of home-cooks.

Those who have used PURITY FLOUR have come to believe in it. They look on PURITY as a friend. They feel they can trust it implicitly, because each and every lot of PURITY FLOUR has always been uniform—always up to the high standard of quality that has made it famous.

Wouldn't you, too, like to use a flour you could always rely on? Wouldn't you like to feel certain that your bread, cakes, and pies were going to turn out exactly right? That's just how you'll feel when you become a user of PURITY FLOUR — the confidence-creating flour.

PURITY FLOUR gives high-class results, because it *consists exclusively* of the *high-grade portions* of the best Western hard wheat.

On account of the *extra* strength of PURITY FLOUR please remember, when making pastry, to add *more* shortening than an ordinary flour requires.

PURITY FLOUR

"More bread and better bread"

And when making bread add *more* water, and PURITY FLOUR will expand into more loaves than the same weight of ordinary flour can produce, thus making "*more bread and better bread.*"

Make your next flour order spell P-U-R-I-T-Y F-L-O-U-R.
It costs slightly more, but it's worth the difference.
Add PURITY FLOUR to grocery list right now.

104

The Relative Durability of Post Timbers.

The Ohio Agricultural Experiment Station has issued a bulletin the result of extended investigations regarding the relative durability of the kinds of timber most commonly used for posts. The following are some of the facts brought out by the investgations:—

1. That a large post usually lasts longer than a small one of the same wood.

2. That there is no difference which end is put in the ground, except that the sounder or larger end should have the preference.

3. In stiff clay soil, the posts rot principally just beneath the top of the ground, and in porous sandy or gravelly soil, they usually rot from the top of the soil all the way down; the effect is the same in both cases.

4. In soil that is full of water all the time posts will last longer It is the alternating between wet and dry that causes decay.

5 From data collected so far, seasoning does not seem to have any marked effect on durability. The best catalpa fence examined was set green. In the best oak fence examined, the posts were cut and put in the ground the same day. Likewise some of the best fences are those in which the posts were well seasoned.

6 Timber that grows rapidly and in the open is not as good as the same variety that grows in the woods. This has been observed especially in the red cedar, the catalpa, and the locust.

7 There is some evidence that it is not a good time to cut posts just as the tree begins to grow in early spring.

8 The wood at the center of the tree is not as good as that just inside the sap wood. This characteristic is very common with nearly all the varieties of timber examined, especially so with the locust, the white cedar, the hardy catalpa, and the oaks.

9. The quality of the wood or the condition of the wood fiber of a post is a very important item in its ability to endure in the soil.

The Sanitary Privy.

The following extracts will suffice to show the importance of the Sanitary Privy, particularly in the case of country houses and farms.

Flies can carry various disease germs to man. By so doing they kill thousands of people, especially babies, every year; therefore kill the flies and save the babies.

If flies have access to human excrement, they not only feed upon it, but they lay their eggs in it. After a few hours the egg hatches out a maggot; this feeds in the filth for about five days and then forms a pupa; after about five days the adult fly comes out of the pupal case, feeds on the filth, and carries disease germs from the filth to the house, depositing these germs on the foods. Thus flies carry disease to people. A fly drops its excrement about once every 4½ minutes, and may spread germs not only in this way, but also with its feet, wings, and mouth parts.

Even if excrement containing fly maggots is buried under as much as 6 feet of sand, the maggots can crawl to the surface, bringing disease germs with them.

Thus it is clear that if flies are kept away from human excrement, not only will they decrease in numbers, but they will be prevented from spreading certain diseases, such as typhoid fever. This can be done by the use of sanitary privies, the construction of which is carefully and fully described in a recent bulletin.

Lack of sanitary privies on neighbouring farms may be responsible for cases of typhoid fever, hookworm disease, and other infections on farms which are provided with sanitary privies, because disease germs may be carried for considerable distances by flies, by animals, by feet of persons, by wagon wheels, or by drainage from one farm to another.

In view of these well-established facts it is evident that one of the highest duties that rest upon a farmer, as a father and citizen, is not only to have a sanitary privy on his farm, but to insist that the pollution of soil with human excreta be prevented throughout the entire neighbourhood by the use of sanitary privies.

In the United States about 400,000 persons suffer from, and about 35,000 die from typhoid each year; over 2,000,000 persons have hookworm disease. Thousands of these deaths and many thousands of these cases of disease might be prevented by the simple use of sanitary privies. A compulsory sanitary privy law or ordinance should therefore be enacted, and be strictly enforced, in every locality not provided with a properly maintained sewer system.—C. W. Stiles, U. S. Dept. of Agriculture.

Principles and Practice of Poultry Culture.

We have just received a copy of Robinson's "Principles and Practice of Poultry Culture," a book of over 600 pages, containing over 600 illustrations. The publishers, Ginn & Co., Boston, Mass., have an enviable reputation as publishers of Country Life Education Series. They aim to make each volume in the Series a little better than the others. We have reviewed this their latest production and find it replete with information, couched in such simple terms that the student has no difficulty in grasping the subject. The author, Mr. Robertson, is one of the best informed men in the country in regard to general poultry husbandry. He has put the results of his long experience in print for the benefit of the public at large and any poultryman will profit by reading what he has to say.

How long do you expect unpainted wood and metal to resist the wear and tear of weather and hard usage?

Here are the facts—the unpainted house or barn will probably be beyond repair in less than 25 years, while the properly painted building, will be practically as good as new. Leave a new buggy, wagon, or piece of farm machinery without repainting, and in less than seven years it will be beyond repair from the checking, splitting and rusting of unprotected surfaces. Paint your implements regularly and you will still be using them at the end of ten or fifteen years.

For a reliable first quality finish, ready for the brush, to meet any paint or varnish need around the farm or farmhouse go to your local merchant who sells

SHERWIN-WILLIAMS PAINTS & VARNISHES

SWP—Sherwin-Williams Paint—is the paint that will make the house look best and protect it the longest. SWP is a pure lead, zinc and linseed oil paint, ground and mixed by powerful machinery. It is as good as 40 years of paint-making experience can make it.

For the Barn and other outbuildings use Sherwin-Williams Commonwealth Barn Red. Spreads easily and covers economically. Put up in full Imperial Measure Cans.

Sherwin-Williams Wagon and Implement Paint is the paint to use to protect your wagons, tools, implements, etc. from rust and decay. Made for that particular purpose, stands severe exposure and hard usage.

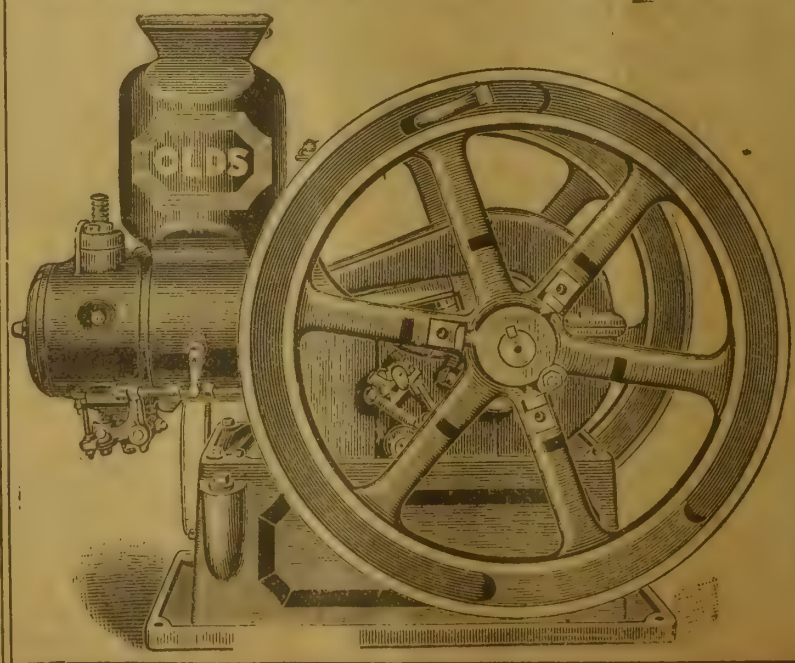
Around the Farm and Farmhouse use

S-W Buggy Paint—for buggies, porch furniture, boats and other surfaces exposed to water and hard usage.
S-W Aluminum Paint—for metal surfaces and machinery,
S-W Floorlac—an easy-to-apply combined varnish and stain for woodwork, furniture and floors.
S-W Family Paint—for cupboards, furniture, woodwork, etc. Stands repeated washing.
S-W Inside Floor Paint—a hard wearing paint for floors and stairs. Eight attractive shades.
S-W Brighten-Up Finishes—a different paint, varnish, stain or enamel for every household use.
S-W Roof and Bridge Paint—for windmills, metal roofs, etc. Prevents rust and decay.
S-W Creosote Paint—a preservative paint for barns, sheds, fences and all rough lumber.

Remember there's a Sherwin-Williams agent in every town.

Address all inquiries to *THE SHERWIN-WILLIAMS CO. of Canada, Limited*, Montreal, Toronto, Winnipeg, Vancouver. 81

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

Canadian Seed Growers' Association.

The eighth annual convention of the Canadian Seed Growers' Association was held at Ottawa, February 8-9, under the presidency of Dr. J. W. Robertson, C.M.G. There was a good attendance of the members.

The report of the directors brought up a series of recommendations made by a committee on regulations consisting of Messrs. Eddy, Klinck and Newman. The more important of these are described in the report from the Seed Branch in the Departmental Notes.

Reports from the district representatives of the Seed Branch were presented by Mr. S. J. Moore (Maritime Provinces), Mr. J. C. Cote (Quebec), Mr. T. G. Raynor (Ontario), Mr. George Clark on behalf of Mr. F. H. Reed (Manitoba and Saskatchewan), and Mr. E. D. Eddy (Alberta). These reports gave instances of enthusiastic and successful work on the part of the members of the association, carried on in spite of the special difficulties of the season due to drouth in the east and a wet ripening period in the west.

An evening public meeting was held in the railway committee room of the House of Commons on February 8 when brief addresses were delivered by Dr. Robertson, the Hon. Martin Burrell, Canadian Minister of Agriculture, Mr. C. C. James, Deputy Minister of Agriculture for Ontario, and Mr. Rufus W. Stimson, of Boston, Mass.

The President explained that the association had been formed for the special purpose of bringing about an improvement in the crops of Canada by the general use of good seed, selected in such a way as not merely to increase the crop but also the intelligence and capability of the farmer himself. It would be difficult, he thought, to devise any scheme with larger or more important objects. Ninety per cent. of the members of the association reported that the crops grown from seed according to the rules were larger in yield and produced more vigorous plants.

The Hon. Martin Burrell, in the course of an interesting speech, expressed his cordial approval of the aims of the association and eulogised the work of the secretary (Mr. L. H. Newman), as explained in a recent address before the Standing Committee on Agriculture and Colonisatian. The work of the association, so far as he understood it, was a voluntary labour of love. The greatest work in the world was done not for money but for pure love of the work itself. It was Ruskin who called attention to the fact that your fee-first man was not the best type; it was evitable that his work should deteriorate by the quality of that thought in it. The greatest work in the world had ever been initiated and carried through by men absolutely without fee or reward of a beneficial kind, or else with a totally inadequate one when compared with its value.

Mr. C. C. James described some phases of the work of the Ontario Department of Agriculture and especially a recent development by which district representatives went personally amongst the farmers to

"My Roofs 'Make Good' for 100 Years. I Want to Tell You Why."

"My New Metal Has Made Me a Proud Man. It Permits a 100-Year Roof at Low Cost."

"Sir, I tell you, I am a proud man. I have at last got the best roof ever made at a low price. My roof will last you for a whole century. You can put it on a wood framing. You can get it at about what you pay for wood roof. You can lay it. It will keep rain, lightning, fire, ice, snow and wind from harming your building. If you want a roof, I have the right roof."

"I Think Every Man Can See How a Roof Is the Big Point in a Barn."

"I worked 50 years to make a cleanly, strong, sure roof at a low cost. I had barns mostly in mind. When I started, bush fires were common. Cedar shingles went up like tinder from a single spark. Lightning burnt barns again and again. Leaky roofs rotted hay and produce by the ton—they let water rot the barn framework. Oshawa shingles stop this.

"Thus, I became one of the first metal shingle men in the world. I aimed to make a roof that would save twenty times its cost by saving a barn frame and foundation, as well as the stuff put into the barn, which represented thousands and thousands of dollars risked over a period of years under a poor roof."

"It Took Years for Me to Get the Design of My Metal Shingle Right."

"I thought it was easy. It was hard. It was a big contract. I didn't dream of what any roof has to stand. I thought about all a roof did was to let rain run off it, and keep in place the rest of the time. I found I had about twenty-five problems to answer at once in a single design.

"My roof had to have 'give' in it, so it would stretch in the hot sun and shrink in zero weather. It had to be ice proof, or lodged thaw-water would gouge seams apart. It had to be smooth, or lodged dirt would rust it. It had to cover its own nails, or the roof would leak. My roof had to be layable by anyone.

"My work was, I had to design a shingle that couldn't be laid face-down, or sideways, or upside down, or crooked, or be marred in the laying, or be smashed on the road between my factory and the place where the roof was. I found my shingle needed ventilating places in it that would let air out but wouldn't let water in. It had to be wind proof. Yes, sir, these things were all worked out by me in 50 years.

"I started to make a spark-proof and lightning-proof roof. I ended by getting one of the best roof shingle designs ever made. My roof has more experience and skill and years behind its design than any roof you can get in metal."

"I Had to Wait Fifty Years for My Last Big Point. This Was It."

"My business was world-wide by this time. My shingles were selling in Australia, Japan, South Africa. Governments specified them for roofs.

"All this time I was getting my design right little by little. But, do what I could, I had been troubled by the metal in it. It seemed impossible to get a metal which might not rust. I had to take the best metal I could get. I needed a strong, light, absolutely non-rusting metal. At last, I found a hint in Europe.

I followed up this metal. At last I devised a non-rusting 100-year metal, which was non-corrosive. The moment I put this metal into my shingle design, I got at one step a 100-year roof. This is the roof you can get from me at a low price."

"Why Do You Pay Me a Low Price? You Have My Big Sales to Help You."

"My metal shingle is not trash. You can get trashy stuff at a cheaper price. (It will cost you thousands of dollars in produce.) Yet you can buy my shingle at a low price. Its quality is kept high and its price is kept low by big, steady sales all over the world. If you do not look into my 100-year shingle, you are not treating your building right. Get a 100-year Oshawa roof for your building. It will save your building, and save you thousands of dollars in produce you worked hard to grow and harvest."

"Get My Book about This 100-Year Roof. It Has Building Hints for You FREE."

"I have helped you and all other builders with a roof I am proud of—a roof I know is right. I want to do more. I made my book 'ROOFING RIGHT' to tell about my roof. But I made it worth while for those who do not take my roof.

"It shows the best buildings in the country—the best barn arrangements. I will send you this book for a post-card, whether you take my roof or not. I want you to take my roof, if it stands your closest examination. Send for my book to-day.

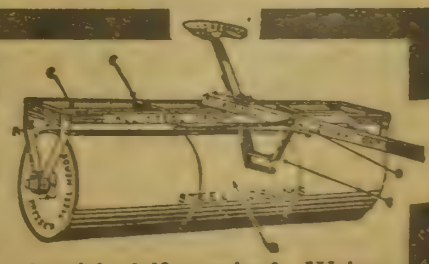
The "Bissell" is a 3-drum roller

3 DRUMS make the best Land Roller. It is easy to understand how the "Bissell" Roller with 3 drums and supported by 6 heads is a STRONGER IMPLEMENT than any 2 drum Roller on the market. With 3 drums the centre bearing is not needed. When the "Bissell" Roller is at work, the axle turns with the drums.

It costs more to manufacture the 3 drum Roller than the 2 drum, but you pay no more for the "Bissell" 3 drum and get BETTER VALUE FOR YOUR MONEY. You get heavier weight in the "Bissell" drums too.

The good points cannot all be told here. Ask your dealer about the "Bissell" Roller and do not be put off with a Roller unless the name "Bissell" is plainly stencilled thereon.



Grass Seeder Attachment furnished if required. Write Dept. M for free catalogue.

SUFFERED TERRIBLE PAINS OF INDIGESTION.

MILBURN'S LAXA-LIVER PILLS CURED HER.

Mrs. Wm. H. MacEwen, Mount Tryon, P.E.I., writes:—"For more than a year I suffered with all the terrible pains of indigestion, and my life was one of the greatest misery. It did not seem to make any difference whether I ate or not, the pains were always there, accompanied by a severe bloating and belching of wind. I did not even get relief at night, and sometimes hardly got a bit of sleep. In my misery I tried many remedies said to cure indigestion, but they did me not one particle of good, and I fully expected I would always be afflicted in this way. At this time my brother came home on a visit and urged me to try Milburn's Laxa-Liver Pills, and got me a few vials. By the time I had taken one vial I began to improve, and could eat with some relish. I was greatly cheered, and continued taking the pills until all traces of the trouble had disappeared, and I could once more eat all kinds of food without the slightest inconvenience. I am so fully convinced of their virtue as a family medicine, I have no hesitation in recommending them."

Price, 25 cents per vial or 5 vials for $1.00 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Special Excursion Fares to the Pacific Coast.

The Intercolonial Railway is offering special excursion fares (second class) to Pacific coast points, good going during March and up to April 15th. These are good to points in British Columbia, Oregon, Washington, California, Arizona, Nevada, Texas and Mexico. Particulars regarding these fares to various destinations may be learned from the nearest ticket agent. Those wishing to profit by the extremely low fares will do well to remember that the Maritime Express carries an up-to-date colonist car through to Montreal on which the traveller will find every comfort and convenience.

A Windsor Lady's Appeal.

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser." also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 309, Windsor, Ont.

Advice to Ladies.

I was sick with Heart trouble and constant headache due to change of life. I called a doctor but failed to improve. I was told to use

GATES' LIFE OF MAN BITTERS AND SYRUP

and they are wonderful with me. It was after the use of the first few bottles my final recovery began, I thank you for the remedies, a few dozen bottles is small in cost compared with physicians bills.

Gratefully yours,
MRS. JOHN FOLEY,
Cornhill, N. B.

Read the Advertisements in the Maritime Farmer.

show them how to do things. As indicating how successfully this plan was working, Mr. James stated that whereas at first they went to ask the Government for money the Government now came to the Department to ascertain how many good, first class men they could furnish. Farmers were beginning to assume a new attitude towards their work. Formerly the agricultural appropriations took the form of assistance to the farmer; now it was seen that what was needed was help for the development of the greatest of the resources which the country possessed and that they were trying to help oot merely one class but the people as a whole.

On Friday, February 9, Mr. Rufus W. Stimson, of Boston, special agent for agricultural education, Massachusetts, U. S. A., read a paper on "Vocational agricultural education for boys and girls." Vocational education, in the usage of Massachusetts, included, he said, all forms of specialised education the controlling purposes of which were to fit for useful occupations. The aims of vacational education were therefore to draw out and develop the vocational capabilities of the individual. In Massachusetts it met the requirements of boys and girls 14 years of age or older. It was definitely and frankly vocational and undertook to train a boy or girl for farming, for the household arts or for some trade and industrial pursuit. He quoted the report of various authorities, notably that of the Industrial Commission presided over by the late Carroll D. Wright, to the effect that from 25,000 to 40,000 boys and girls left school at 14 and between that age and 16 did not engage in any settled occupation. There was now a general movement throughout the United States for agricultural education of secondary grade, and probably there were not fewer than 500 secondary schools in which agriculture was now seriously taught. The training varied from the study of an agricultural text-book in the hands of the general teacher to the out-and-out vocational school where the teachers were specialists in agriculture. After describing the plans for agricultural education in various States of the American Union, Mr. Stimson explained that of Massachusetts, a fundamental feature of which was known as "part-time work in agriculture." This meant that the student must spend part of the time required for his education in productive farm work preferably at home and part of his time at school, the farm work and school study being closely correlated.

The following verbatim extract from Mr. Stimson's paper will best explain how in this system practical work subserves an educational purpose:

A farming project is a thing to be done on a farm which, in the preparation for doing it and in the carrying of it out to a successful result, involves a thorough-going educational process. The improvement project of constructing a concrete walk to the front door might involve a study of the nature of cement: its action on sand, gravel and broken stone; its resistant qualities to the weather; the seasons in which it may be used; its cost as compared with other materials, such as board, plank, tar, brick, flagging and asphalt; the mathematical determination of proportions of sand, cement and stone to be used; the geometrical determination of the sections into which it should be divided, and whether it should be crowned or flat; the geographical sources of the raw material and the commercial conditions for purchasing the cement. The experimental project of planting an untried variety of fruit might involve a study of the probable adaptability of the variety selected to the soil on the farm, the climate of the locality and the market demands within reach of

Amatite ROOFING

Mineral Surfaced— Needs No Painting

EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the real mineral surface *which never needs painting;* the two layers of Pitch which is the greatest waterproofing material known; the two layers of heavy Tarred Felt—all these contribute to the popularity of Amatite.

We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.

Simply the fact that it needs no painting is enough to make a man sit up and take notice—especially the man who has spent time and money in painting and repainting smooth surfaced roofings.

the farm. The productive project of growing a crop of clover might involve a study of the various varieties of clover; the comparative adaptability of those varieties to the given field on which the crop must be grown, and to the climate of the locality; the most reliable places for the purchase of seed; the best time for seeding; the best time for cutting; the best methods of curing and storing; the mathematical culculation as to the saving in cost of feeding stuffs which the crop would afford; the chemical elements it would furnish in the ration and the beneficial chemical biological and mechanical effects on the soil in which it would be grown.

The paper concluded as follows: "Good results have already been achieved. It is believed that the Massachusetts plan of vocational agricultural training will justify itself from every reasonable point of view, and will prove to possess undeniable merit as a method of training both for farming as a definite calling and for intelligent and vigorous participation in the community life of any Commonwealth."

On the motion of the president a cordial vote of thanks was given to Mr. Stimson for his exceedingly valuable and suggestive paper, and a wish was expressed that it might be printed separately in pamphlet form for general distribution.

Other papers were read by Professor L. S. Klinck on the improvement of cereal grain at Macdonald College, by Mr. G. H. Clark on the inspection of seed crops, by Mr. J. H. Grisdale on cultural conditions for seed growing, in which he showed that cultural conditions constituted an important factor in the production of high class seed apart from the pedigree of the stock itself, and by Dr. Charles Saunders on the distribution of seed produred at the Experimental Farms. Asked in the course of a discussion as to the origin of the Marquis wheat with which Mr. Seager Wheeler, a member of the association, had gained the prize of $1,000 at New York, Dr. Saunders replied that there was no record as to who had made the cross; but he believed that it was made by his brother, Dr. A. P. Saunders, at Brandon, in 1892. The wheat was one of the varieties selected by him (Dr. Charles Saunders) from mixed progeny of the cross at Ottawa in 1903 when taking up his present duties as Cerealist.

The report of the secretary (Mr. L. H. Newman) showed that the total number of members of the association in full standing was 164, which with 232 applicants on the list made the total number affiliated to the association to be 396.

The Formation and Cultivation of Soil.

(Continued from page 417).

the mower and the seeder. I am of the opinion that even here where the land is irregular, you can gradually change from the small field to the large field, and make it possible to use large instruments. Double cutaway discs are made in Canada and should be introduced on all farms. Not only in soil preparation operations we should steadily improve our methods but of economy in labor, and best of all in the harvesting and cultivation of root crops. Four years ago, I had a two-row cultivator and found we could do with one man and two horses, just twice as much work, and the work is certainly as effective as that done by a single row cultivator. There is now a machine of this description made in Canada by the Massey-Harris people; you can get them for $50 or $55. It is a right good cultivator, does two rows at a time and if you grow a few acres of roots, you will save the cost of it in a year, over and above what it would cost you.

When you have got your crop growing, get the largest instrument in operation. Where you have small fields, it is more difficult, but where ever you can, use the large implement. It will materially lower the cost of production. The man who is able to increase the fertility of the soil, and get a lower cost of production is the man who will be the successful farmer. We can every one do it if we will give the matter a little more consideration. These things cannot be done without thinking about them, and of course, don't merely think about it, DO IT.

An address by Prof. J. H. Grisdale at the recent Nova Scotia Farmers' Association, Yarmouth, N. S.

The Third Annual Maritime Horse Show.

The third Annual Horse Show of the Maritime Stock Breeders' Association will be held in the Winter Fair Building, Amherst, N. S., on the third, 4th and 5th of April, 1912. The prize list is now in the hands of the public. If you have not received a copy send your name and address to F. L. Fuller, Truro, N. S. If you have a good horse enter him at the Show. The prizes offered are worth going after.

The I. C. R. will issue return tickets for one way first class fare on April 3rd, 4th and 5th return limit. Agents east of New Glasgow will issue tickets on the Standard Certificate plan. Other railways are granting the same rates.

The first and second Shows were more successful than the most sanguine horsemen anticipated. Help to outclass the former shows by your attendance at and support of the third annual Show. Admission to Show, 25cents; children under 12, 15 cents; season tickets, $1.25; reserved seats, 25 cents. Don't forget the dates.

Actions Speak Louder Than Words

Everywhere all the world over you will find the successful men and women are those who have "done things" and are doing things—you feel you can bank on them every time.

That's one reason why I always use The Metallic Roofing Co's. materials on my various contracts and work—they don't have to tell you what they will or might do but show you what they "have done" and "are doing".

One great advantage of the Metallic Roofing Co's. goods over any others, is that when your job is finished, whether Roofing, Sidings, Walls, Ceilings or any old thing—you know it will never need any more attention—in your life time anyway. Now take

Honest Tales by the Philosopher of Metallic Town

EASTLAKE STEEL SHINGLES

Fire, Lightning, Rust and Stormproof Have already stood the test for 26 years.

They outwear any metal shingle on the market. They are of better steel than any other. The design and construction of the "EASTLAKE" Steel Shingle is a guarantee in itself---because unless the steel is of the highest quality it will not make an "EASTLAKE" Shingle, as inferior Steel will not stand the stamping and forming.

There are no other metal shingles on the market that can stand the "EASTLAKE" process.

"EASTLAKE" Steel Shingles were the first **lightning proof** shingles in Canada---and are just as far ahead of others to-day---in fact with an "EASTLAKE" Roof you need no lightning rods.

There are many other exclusive advantages I have experienced in using "EASTLAKE" Steel Shingles that I have no room to mention here, but if you are interested in building or roofing write to-day for free booklet and full information.

The P. E. I. Provincial Seed Fair.

Another milestone in the history of the good Seeds and Household Science Movement in Prince Edward Island was reached on March 5th to 8th when the Provincial Seed Fair was held at Summerside, in the Andrews Warehouse and in St. Paul's Hall.

The entries numbered upwards of 1,800, the weather man smiled and throngs of Island farmers assembled to view the splendid exhibits and to listen to and take part in instructive addresses on Fruit Growing, Poultry Raising, Household Science and various other subjects relative to their profession, by experts in their respective departments.

Rev. Dr. Gauthier, president, and Mr Robert Agnew, secretary of the Seed Fair Association, were untiring in their efforts to make every department of the fair a success. The management of the fair is aiming at bringing the Quality of Island Seeds up to a high standard and do not in any way encourage any lax methods that might prove detrimental to the title "Prince Edward Island Grown."

THE JUDGING.

S. J. Moore, Maritime Seed Inspector, said that the samples of Timothy were excellent.

Out of the ten prizes, practically all would grade No. 1 and three would grade Extra No. 1 under the Seed Control Act. There were only a few exhibits of Mammoth, Common Red and Alsike Clover. There was one good sample of Alsike and one good Red Clover but the other Red Clover samples would not grade and could not be sold under the Act. They contained a large quantity of such weed seeds as Sorrel and Cinquefoil. He was delighted with the exhibit of turnip seed.

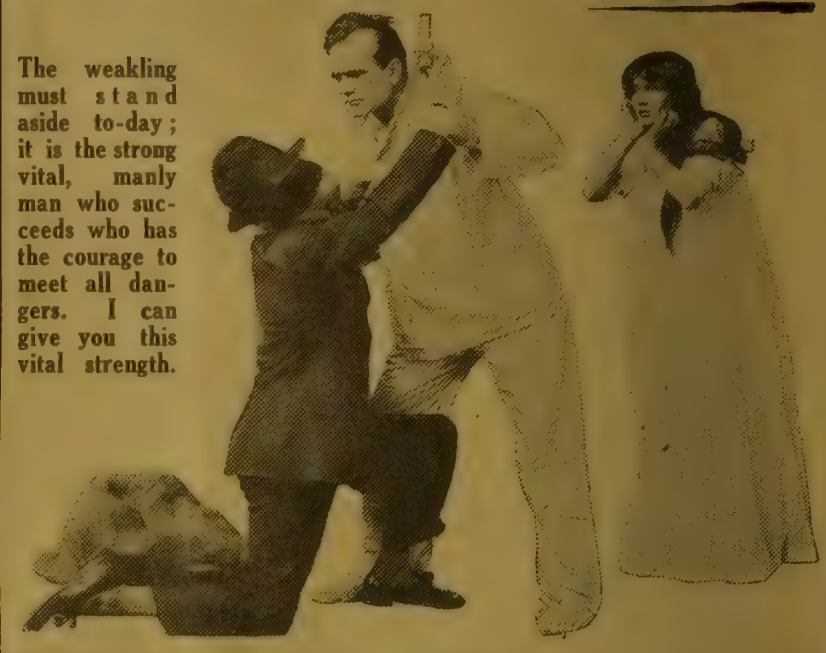
Robert Robertson, superintendent of the Dominion Experimental Farm at Nappan, Nova Scotia, judged the potatoes. He laid emphasis on trueness to type, freedom from scab and other defects and on quality as indicated by cutting the potato. Of the McIntyres or Blues many were thrown out because of their deep eyes and big rough appearance. Exhibitors in some cases should choose smaller, smoother and more uniform potatoes. There were six entrfies for the Grady cup and five of these found a place in the ten prizes given in McIntyres. In the class any other variety (named), some exhibits were thrown out because they were not named while some other were wrongly named.

John Andrew, of Belmont Mills, and G. LeLacheur, of Murray Harbor, judged the wheat. In the White Fife class the best sample was put low in the prize money because it contained barley, oats and stinking smut or bunt. Other samples in all classes were cut severely because of being too poorly graded and consequently lacking in uniformity. Others were not true to the variety or the type of the variety. One sample was very badly sprouted. Some contained weed seeds, in some cases noxious ones. Intending exhibitors should rogue out such impurities as barley, oats and weeds while the grain is standing. It should be thoroughly ripened, cleaned anh properly graded if prizes are expected in a Seed Fair of such a class as the Prince Edward csland Provincial. Altogether there were many excellent exhibits in wheat but the samples were on the whole not as plump and well filled as usual.

The judging of the oats was done by Richard Creed, of Albion, and John Andrews, of Belmont Mills, assisted by G. LeLacheur, of Murray Harbor and Professor Ross. As a whole the exhibit was excellent. Even the worst samples would have been regarded as excellent in any ordinary seed show. Great stress was laid on

Peerless Poultry Fence Protects
We build Peerless Poultry Fence strong enough to keep marauding animals out and sufficiently close to keep small fowl in.
A Real Fence That Gives Real Service
Built same as farm fence of good galvanized wire, protecting it against rust. Top and bottom No. 9 heavy, hard, steel wire—intermediate horizontal wires No. 12—stays No. 13, 32 to the rod. This makes an excellent, all around, general purpose fence suitable for turning all classes of stock.
Agencies nearly everywhere. Live agents wanted in unassigned territory.
The Banwell Hoxie Wire Fence Co., Ltd., Winnipeg, Manitoba, Hamilton, Ont.

Restores Men To Vital Vigor



The weakling must stand aside to-day; it is the strong vital, manly man who succeeds who has the courage to meet all dangers. I can give you this vital strength.

Vitality is the thing which makes success; it gives men that compelling power which sends them forth eager and equipped to meet and overcome all obstacles; it is the thing which gives our young men courage to face death; it is the thing which inspires and holds a woman's love and faith. No matter what your age, I can give you this same vitality. I can restore the vigor you lost, no matter what early or later indiscretion may have sapped your streagth. I can make you "young" and keep you "young." From an intimate and studious observation of possibly 100,000 weakened men I say to you that vitality or the lack of it means all the difference between a manly man and a half man. The man who bubbles with vital power will exert a pleasing influence upon all with whom he comes in contact; women are naturally attracted to him, as are men. Lack of vitality is a negative condition, and it even repels. You wear my Health Belt and suspensory attachment all night; it sends a great, glowing, health-giving current of electro-vimut into your nerves, blood and organs; it takes all the "kink" out of your back and all the coward out of your makeup; it puts you right up in the "feeling fine" class and keeps you there. No stimulation, no false results; just a sure return to manhood and courage. Recommended also for rheumatism, pain in the back, kidney, liver, stomach and bladder disorders. It makes you feel young and keeps you feeling young forever.

Let Me Send You THIS BOOK Free

Here is my latest illustrated book, "Health In Nature, containing a fund of privrte information relating to weaknesses of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely uo obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

DR. M. F. SANDEN, CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs:—Please forward me your Book, as advertised, free.

NAME.....

ADDRESS.....

purity, that is freedom from other varieties and other kinds of grain and from weed seeds. Wild buckwheat and wild peas were found in a few samples. Some of the oats, however, was cut on the green side and consequently not as plump as it should have been, injuring to a considerable extent its value as seed. Some oats again was not true to type or variety and was thrown out on that account. A few excellent samples of Banner oats contained too much pin oats. This could be easily separated by using coarser screens in the fanning mill. These pin or secondary oats are only fit for feed and are not good for seed. The decision of the judges was determined very largely by purity, plumpness and colour. In some close cases the thinness of the hull decided the award.

In the competitions for the Heartz cup the scores of the fields of standing grain last summer were also considered. In many cases the samples were so nearly of equal quality that the judges feel that if they were asked to prize the same grain again they might make the placings different and could give equally good reasons for their placings. The clipping of the grain either by machinery or by putting the grain in a barrel and chopping it with a spade had no influence whatever in making the decisions.

THE FRUIT GROWERS' MEETING.

The fruit growers held a successful meeting in Market Hall at which T. A. Peters and Prof. Ross discussed the subjects of fruit packing, injurious insects, and spraying with Lime-Sulphur and Arsenate of Lead.

A POULTRYMEN'S MEETING.

was also held during the Fair, at which Frank Glydon presided. In his opening remarks he referred to the status of the poultry and egg business in Canada, after which Rev. Dr. Gauthier, D. B. McDonald and other gentlemen contributed interesting data re their own experiences in poultry culture.

CO-OPERATIVE FARMING.

W. E. Cameron, B. Sc. of St. Dustans College, addressed a large audience on the subject of Co-operative Farming, during which he touched briefly several important phases of agriculture.

He spoke of the business state of farming, pointing out that market conditions differ to-day from those of the past. The scope was much wider and there was more chance for dishonesty. The larger market called for larger quantities of a graded product, and this the ordinary individual farmer cannot provide. By quotations he showed that the farmer only realized about 40 per cent. of the cost to the consumer.

Co-operation, Mr. Cameron described as an organization for the purpose of carrying on the business of buying and selling, its basis being equality and equity; is giving each member the same voice in the business, equity is giving each one the same justice in distribution. Co-operation differs from a joint stock company in that it has unlimited liability. Co-operation is not merely a money making society but a society for the uplift of the community.

By referring to the results of co-operation in Germany, France and other countries he showed its adaptability to every condition of farming in every country in the world, Communities form into units and units into a grand management and by paying the middleman they could place their products on the large markets graded and in good condition. Co-operation in buying fertilizers gives a profit.

The discussion which followed was opened by Rev. Dr. Gauthier, who expressed the opinion that it would be a great benefit to the country if the people who have money in the banks

Not only this → but these as well

DON'T think that concrete can be used only for building bridges, silos, walls and walks; because if you do, you will probably overlook all the places where *you* can use it *now*.

T. L. Irving, of North Georgetown, Quebec, used concrete for 81 different purposes on his farm in 1911.

There are probably at least a dozen *profitable* uses for concrete on your farm at the present moment.

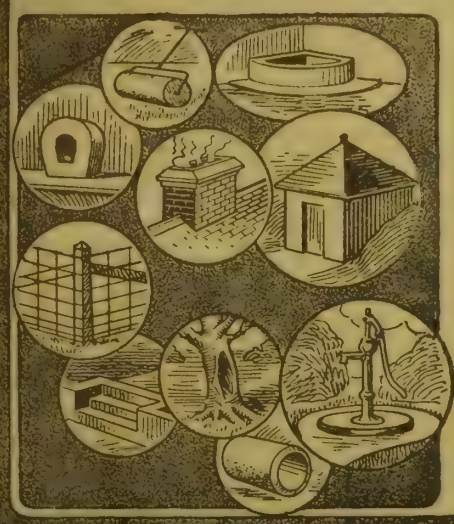
Perhaps you haven't thought of Concrete, except for a new barn, or a silo, or some other *big* improvement for which you aren't quite ready yet. That's why you should read

"What The Farmer Can Do With Concrete"

It will open your eyes to the hundreds of uses that other *farmers* have found for this material. In plain language, and with the aid of many photographs, it explains just what these uses are, and how they can be applied to your farm.

Concrete can not only be used for all the purposes to which wood has been applied, but also many others for which wood would never be suitable.

It is not only a building material; it's a "handy" material, something that you'll grow to depend upon more and more, as you learn its possibilities.



So write for this book. You'll find it isn't a catalogue, nor an argument for you to buy our cement. Every one of its 160 pages is devoted to telling you what farmers have done and can do with concrete.

IT'S FREE FOR THE ASKING.

INVINCIBLE FENCING

Like the invincible, thoroughbred British Bulldog, never lets go. Its locks, stays and strands are of the hardest, strongest, toughest, best galvanized open hearth steel wire ever used in fencing. They embody in zinc-clad, rust-proof steel, the invincible qualities of that famous breed of dog which never relaxes its hold.

Invincible Fencing

From first to last, from ore to finished product, INVINCIBLE FENCING is Canadian made and Canadian quality, intended for Canadian trade. The Steel Company of Canada wants the patronage of Canadian fence buyers and intends to get it by supplying a product which in quality and value cannot be surpassed.

Invincible, Hot process Galvanized Gates, galvanized after made, absolutely lead the world in quality. They are the final word in the art of gate making.

Our agency is without exception the most desirable fence line for the future in all Canada. Write at once.

The Steel Company of Canada, Limited.
The Fence Department, Box 31 MONTREAL, CANADA.

would co-operate with their less fortunate neighbors and let them have their money at a lower rate of interest than is charged by the banks.

Walter Lea spoke of the benefit of co-operation in dairying and thought that the same principle could be profitable followed along other lines of the farming industry. Especially could this be done with eggs, as Mr. Cameron showed that it now costs 10c. to sell 15c. worth of this product.

Rev. J. J. Macdonald strongly urged co-operation in the marketing of eggs.

Mr. Glydon read an excellent paper prepared by Robert Robertson, of the Nappan Experimental Farm. The paper dealt at some length with the care and feeding of stock, rotation of crops and fertility of the soil.

Jas. E. Murphy, R. H. McDonald, Garnet LeLacheur, R. H. Montgomery, D. B. McDooald, D. J. Thompson, Joseph Noonan and others joined in the discussion.

DAIRYING.

was discussed by Harvey Mitchell of the Dairy Division, Ottawa and by W. M. Lea, Victoria. Their addresses were practical, instructive and an incentive for farmers to pay particular attention to the various details of the dairy industry.

GOOD SEEDS.

was the subject of an excellent address by Garnet LeLacheur and Prof. Ross came next with a strong address on "The Seed Control Act."

EDUCATION.

The P. E. I. Superintendent of Education gave an interesting talk on Education for the Farmer. He grappled with the problem in a masterful way, showing how it affects the basic industry of the Island Province.

THE LADIES' MEETINGS.

in Labor Union Hall were well attended and were presided over by Mrs. Neil McLeod.

On Wednesday afternoon Prof. Ross gave a most interesting talk on "Homemaking an Ideal of Womanhood;" Mrs. Neil McQuarrie on the "Ethics of Nursing," Miss Hunt on "Handicraft" and Mrs. Gill on "Women's Institutes." All the addresses were well given and more than usually interesting and instructive.

On Thursday, Miss Dutcher gave splendid instruction on "The Care of Milk and Cream;" Dr. McLellan a most informing address on "Household Hygiene;" Miss James a delightful talk on "Short Cuts in Housekeeping;" Dr. Gauthier an inspiring address showing the value of "Women's Institutes."

Pride in Your Garden

will be natural, and justified, if you plant Ewing's Reliable Seeds and give them proper care. The bumper crops which, for forty years or more, have been grown from

EWING'S Reliable Seeds

are explained by the care which we take to give our customers only specially selected seeds that are clean, fresh, healthy and true to type—seeds that produce grains, roots, vegetables and flowers of which the growers may well be proud. **Write for our handsome illustrated catalogue,** and if your dealer hasn't Ewing's Seeds order from us direct. 22

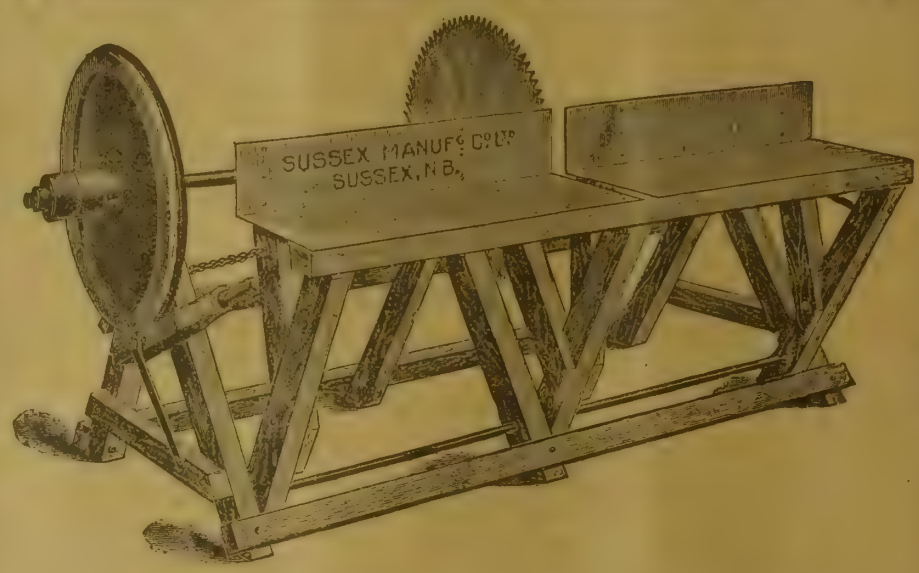
Wood Cutters Made in Three Sizes.



We make the best Wood Cutter on the market. The length of table on our Long Swing is 8 feet, 3 inches; distance between balance wheel and saw 4 feet, 3 inches. Heavy substantial frame and well braced. Steel plate table.

Length of table on Flat Rolling Machine is 8 feet, 3 inches; distance between balance wheel and saw 4 feet 3 inches. The table of this machine moves on grooved rollers and vd. track, which holds the table in position, making it move very easily to and from the saw.

Our Short Swing is built on the same principles as the Long Swing, the arbor and frame is shorter; length of frame 4 feet, 3 inches; distance between balance wheel and saw 3 feet, 6 inches.

On all our machines the arbor is the same size, made of the best turned steel and runs in bearings of the best babbitt. The balance wheel is a solid web and weighs 180 pounds.

We have a large number in stock and can ship promptly. All enquiries will have prompt attention.

Wake Up, Weak Men

Get Some Life Into You

What's the use of dragging your legs about like a wooden person? Feel like a person of spirit. Away with the pains and aches, off with this wretched feeling as if you were eighty years old and one foot in the grave. Come and let me put new life into your nerves; let me give you a new supply of youthful energy. Let me make you feel like throwing your chest out and your head up, and saying to yourself: "I AM STRONG AND HEALTHY!" Let me give you back that old feeling of youthful fire, vim and courage. I can do it, so that in two months you will wonder that you ever felt so slow and pokey as you do now.

It is for men who open their eyes in the morning upon a world that looks blue and discouraging; for men who feel tired, despondent and out of luck; who have lost the fighting spirit—those fellows who have almost concluded that nothing is worth fighting for—who have pains in the back, and who don't get rest from their sleep, and who wish that they were as strong as they used to be. It is all a matter of nervous energy—that is what ambition comes from—and that is what you can get from Dr. McLaughlin's Electric Belt. It is an invigorator of men.

It will make you strong. It will send the life blood dancing through your veins, you will feel the exhilarating spark warm your frame, the bright flash will come to your eye, and a firm grip to your hand, and you will be able to meet your fellow man and feel that what others are capable of doing is not impossible for you. This grand appliance has brought strength, ambition and happiness to thousands in the past year.

Dr. McLaughlin's Electric Belt makes you noble; it causes the nerves to tingle with the joyous exhilaration of youth; it fills the heart with a feeling of gladness makes everything look right, and makes the nerves like bars of steel. It has cured Nervous Debility, Weakness of every kind, whether in Nerves, Stomach, Heart, Liver or Kidneys, Rheumatism, Pains in Back and Side, Lumbago, Indigestion, Neuralgia, Constipation, Dyspepsia, and all troubles where new life can be given. All this while you sleep, by pouring electricity, which is Nature's energy, into your nerves and blood to the vital parts; when they are weak it will make them strong.

I have cured thousands of men who have squandered the savings of years in useless doctoring.

Read What the Cured Say

Read the Proof---Nothing Short of Miracles are Being Performed Every Day

Needs No Doctor Now.

Huntsville, Ont., Dec. 12, 1911.

M. F. McLaughlin:—

Dear Sir, —I am sorry I have not written before. Your Belt certainly has done me a world of good, for I feel a different woman altogether, although I have not worn it regularly. I am satisfied with what it has done for me, as I have never had a doctor for myself since I got your Belt, which is something new for me for it seemed I was always doctoring. I gained 13 pounds in four months, and with lots of work to do too. Wishing you great success, I remain,

Yours truly, Mrs. Cornish.

Weak Back Cured.

No. 1 Inkerman St., London, Ont., Jan. 7, 1912.

M. F. McLaughlin:—

Dear Sir, —Just a few lines to let you know of the splendid results I have had from your wonderful Belt. My back is well; its chilly feeling has left me, and I feel like a new man altogether. I have spent many dollars to get a cure, but all to no purpose. I am sure I now have a remedy that has no equal. Some of my friends tell me sometimes how sick they feel and I tell them to do the same as I did, wear one of Dr. McLaughlin's Electric Belts, and they will feel the same as I do. I shall keep on telling them the same, for I know your services are worth all you ask for your Belts ten times over. Wishing you every success in this New Year, I remain,

Yours truly, F. Doney.

Weak Kidneys and Back — Rheumatism.

Cochrane, Ont., Dec. 30, 1911.

M. F. McLaughlin:—

Dear Sir, —I just feel proud of the results I have obtained from the McLaughlin Electric Belt as I was a terrible sufferer for eight months and tried everything that could be tried to relieve me from pain, but without any relief, but I used your Belt for three months and I am now perfectly cured and never felt better in my life. I am 74 years old, and, on account of my age, no one thought there would be any hope for me. I will recommend your Belt to any sufferer needing aid. With best wishes, I remain, your truly,

S. M. Barnes.

My Belt is easy to use; put it on when you go to bed, you feel the glowing heat from it (no sting or burn, as in the old style belts), and you feel the nerves tingle with the new life flowing into them. You get up in the morning feeling like a two-year-old

Wherever you are, I think I can give you the name of a man in your own town that I have cured. Just send me your address, and let me try This is my twenty-fourth year in the business of pumping vim into wornout humanity and I've got cures in nearly every town on the map.

If you come and see me, I'll explain it to you. If you can't call, let me me send you my book, full of the things a man finds inspiring to strength and courage. Free, if you send this ad.

Office Hours—9 a.m. to 6 p.m. Wednesday and Saturday, to 8.30 p.m.

(Continued from page 415).

Halls as it should be appears quite general,

Therefore resolved, that in the opinion of this Association, it is both possible and expedient that at least one agriculturist be placed on the ticket of each political party in every constituency in the approaching Provincial Election.

* * *

Moved by S. L. Peters; seconded by J. S. Hayward:—

Resolved that in the opinion of this Association the conditions of Agricultural pursuits in the Province require the urgent attention of our Provincial and Federal Governments, and as a necessary means of regenerating our rural life and settling people upon the land, we heartily endorse a courageous policy of state advances or agricultural loans to farmers and the other persons engaged in such pursuits.

We further request the Provincial Government to take immediate steps to raise the necessary funds with the Dominion Government for the use of the Savings Bank deposits or in such other manner as may be expedient.

A Woman's Sympathy

Are you discouraged? Is your doctor's bill a heavy financial load? Is your pain a heavy physical burden? I know what these mean to delicate women—I have been discouraged, too; but learned how to cure myself. I want to relieve your burdens. Why not end the pain and stop the doctor's bill? I can do this for you and will if you will assist me.

All you need do is to write for a free box of the remedy which has been placed in my hands to be given away. Perhaps this one box will cure you—it has done so for others. If so, I shall be happy and you will be cured for 2c (the cost of a postage stamp). Your letters held confidentially. Write to-day for my free treatment. MRS. F. E CURRAH, Windsor, Ont.

This Washer Must Pay For Itself.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse. But I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse wasn't "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse although I wanted it badly. Now this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me.

So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

You see I sell my Washing Machines by mail. I have sold over half a million that way.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that, without wearing out the clothes.

Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges nor break buttons the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first and I'll make good the offer every time.

Let me send you a "1900 Gravity Washer on a Month's free trial. I will pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it?

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months, in wear and tear on the clothes alone. And then it will save 50 cents to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day and let me send you a book about the "1900 Gravity" Washer that washes clothes in 6 minutes.

Address me personally—A. S. Bach, Manager, 1900 Washer Co., 357 1-2 Yonge St., Toronto.

Have City Conveniences

REPLACE the pestilent, dranghty, dangerous and offensive out-of-doors closet with an indoors closet which requires no sewer, no plumbing, and no finshing system. Have city conveniences in your home. Safeguard family healih by installing a

"Tweed" Closet

Sanitary and Odorless

"Tweed" Closets can be installed in the bathroom, cellar, or any other convenient place indoors, merely requiring to be connected by a pipe for ventilation with a chimney hole. "Tweed" Liquid Chemical, used in connection with Tweed Closets is both a deodorant and a disinfectant. Many hundreds of Tweed Closets have been sold in Canada. Send for illustrated price list.

THE STEEL TROUGH & MACHINE CO., LIMITED,

DEPT. 103 TWEED, Ont.

Advertise in the Maritime Farmer.

As a preliminary method of carrying out this project we recommend the creation of a Land Settlement Commission to manage the business side of the operations, to acquire inform and sell vacated farms to natives or immigrants and otherwise assist the better settlement of people upon the land, until such times as a charter for an Agricultural bank is obtained.

Moved by T. W. Butler; seconded by Geo. Creighton:—

Whereas James Robinson, T. W. Butler, E. A. McCurdy, Donald Morrison, Wm. L. Allain, W. A. Park and Hon. Allan Ritchie are applying for incorporation to build a line of railway along the Miramichi Valley from Newcastle to Tracadie for the further development of the Province, as well as the accomodation of the people living along the said district has long been recognized, and Dominion and Provincial aid has, from time to time, been authorized, for the purpose of inducing capitalists to construct and operate said line of railway, such inducements have not proved sufficient to secure the building of the said line, and,

Whereas, the said district is thickly populated and settled throughout its whole extent and that in winter the inhabitants have no means of communicating with other points or among themselves, except by highway, and are practically cut off from all communication with all other points; and,

Whereas, large industries are carried on within the confines of the said district at a great difficulty, due to the want of adequate transformation facilities and,

Whereas, the inhabitants of this section largely engage in winter fishing, and by reason of the expense of exporting the catch to the market, are forced to accept a smaller price than is offered and paid at points within reach of railway facilities;

Whereas, the lands along the said railway, from an agricultural standpoint have proven to be of first-class quality, and if greater facilities were afforded for transporting agricultural products to market, the development of the agricultural districts would be enormous.

Therefore resolved that this Association recommend that Government aid, such as has been accorded the St. John River Valley Railway, be provided for the said line.

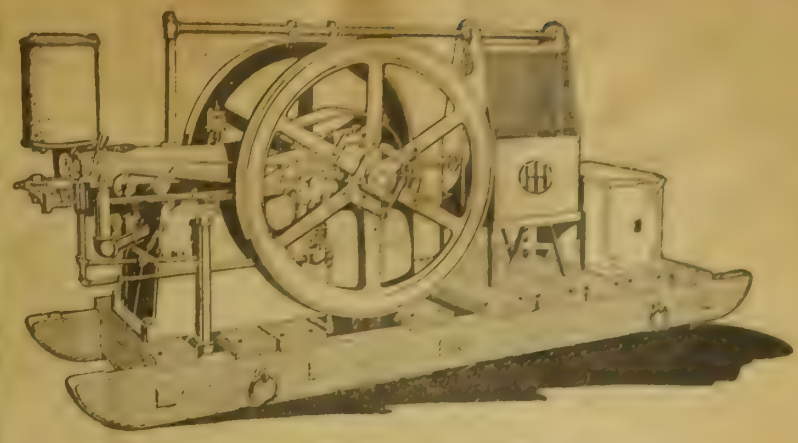
OFFICERS FOR 1912-13.

Following are the officers elected for the ensuing year:—

President—L. H. Smith, Albert; Vice-President—C. Ashley George, Upper Sackville; Recording Secretary—A. G. Dickson, Chatham; Corresponding Secretary—Morris Scovil, Meadowlands; Treasurer—H. H. Smith, Hoyt; County Vice-Presidents—Albert—R. A. Smith, Elgin; Carleton—W. A. Taylor, Florenceville; Charlotte—Tilley Reid, Lever; Gloucester—B. J. Power, North Tetagouche; Kent—Fidele Daigle, Dundas; Kings—Edgar Shamper, Kingston; Madawaska—J. A. Bernier, Edmundston; Northunberland—Clifford Galloway, Napan; Queens—John McDonald, Hibernia; Restigouche—John McKinnon, Dundee; St. John—R. G. Murray, St. John; Sunbury—Milton A. Smith, Hoyt; Victoria—J. W. Stevenson, Arthurette; Westmorland—William Murray, Murray Road; York—W. H. Moore, Scotch Lake.

PARLIAMENTARY COMMITTEE.

S. L. Peters, T. C. Strong, J. T. Prescott, R. G. Murray, T. W. Butler, Morris Scovil, P. G. Mahoney, W. B. Dickson, Lewis Smith and J. A. Bernier were appointed as a committee to bring the resolutions passed by the Association before the Government for action.



Your Best Helper

YOU work too hard on your farm if you haven't an engine. You can make more money, with much less labor, by using an I H C gasoline engine. Why not profit by the experience of other farmers? Think what it means to you and your family to have the cream separator, churn, pump, feed grinder, fanning mill, thresher, woodsaw, grindstone, washing machine, and many other machines, run by an

I H C Gasoline Engine

Think of the profit you will make by the saving of work and time. Think how much more pleasant, how much more attractive your farm and home will become when the I H C engine does so much of the hard work.

I H C gasoline engines are reliable and durable. They run smoothly, year in and year out. Whatever style and size engine you want is in the I H C line, which includes: Vertical type—2, 3, 25, and 35-horse power; horizontal—1 to 50-horse power; mounted on skids—1 to 8-horse power; portable—1 to 25-horse power; traction—12 to 45-horse power; sawing, pumping, spraying, hoisting, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local agent, or, write nearest branch house for our new catalogue.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forwafd replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

W. KENNETH McLEOD, Port Elgin, N.B.

The All Canadian Route to Montreal.

Via the Intercolonial Railway Maritime Express is the only All Canadian Route to Quebec and Montreal from the Maritime Provinces. The Maritime Express is generally admitted by experienced travellers to be the most comfortable train in America. This is especially true in regard to the dining and sleeping car service. The diners of the I. C. R. are roomy and well ventilated and furnished in the best of taste. The excellent meals are served Table d'hote at a price away below the a la carte rates prevailing on the company owned lines. The sleeping coaches are up to date in every particular, and the smoothness of the road bed makes the long journey easy and pleasant. Being popular with a class of travellers who are generally found to be the acme of good company the through journey is never found dull, and even during the winter months there is much of scenic interest in the day's ride through the Province of Quebec. Montreal is reached at the convenient hour of 6.30 p.m. and connections are made at Bonaventure Union Station with the through trains of the Grand Trunk Railway for Toronto, Buffalo, Detroit, Chicago, and other points in Western Canada and the United States.

Rocks! Rocks! Rocks!

"WILLOW FARM" FOR SALE.

"Willow Farm" is situated two miles from the centre of the town of Amherst, which is a growing manufacturing town of over nine thousand population, and one of the best markets in Canada. There is a good public school within forty rods of the house.

The farm consists of one hundred and twenty three acres, forty three acres of marsh and eighty of upland, sixty five of which are under circulation.

The upland is in a high state of cultivation as a large stock of cattle have always been kept on the place and for several years a short rotation has been followed. The soil varies some but is mostly a good loam quite free from stone and easily worked. The pastures are well watered by springs and brooks.

The house is 28x38 feet, two stories with ell 16x20 with good cellar, heated by furnace. Barn 50x80 feet with basement stable which will accomodate forty cattle and six horses, also root cellar holding two thousand bushels. Carriage and impliment shed 26x36 feet and other out buildings all in first-class repair.

The fencing is nearly all of woven wire and in good order,

A wood lot of 70 acres, three miles from the farm will be included in the sale.

A retail milk trade of about one hnndred and twenty quarts a day will be sold with the farm if desired.

This is one of the finest live stock and dairy farms in Cumberland County; a beautiful home and a splendid opportunity for the right man. Apply to

C. HOWARD BLACK, Owner,

W. E. FOSTER, Prop.
Shubenacadie, N. S.

Feed The Land—
AND
It Will Feed You

Many farmers would get higher interest on their money if deposited IN THE SHAPE OF FERTILIZERS IN THE SOIL, than if they placed the money in bank—the interest being paid in increased crops.

When the Canadian farmer becomes sufficiently interested in fertilizers to make his own mixtures at home, it will be a good thing for the farmer and for the country at large.

Fertilize scientifically—study the "VANCO" Book—and reap the benefits in bigger crops.

Make your own Fertilizers, to suit each soil and crop — buy **"Vanco"** guaranteed chemicals, prepared right here in Toronto, and thus save the heavy duty which must be paid on ready-mixed fertilizers

MURIATE OF POTASH
—guaranteed 50% actual Potash.

SULPHATE OF POTASH
—guaranteed 48% actual Potash.

NITRATE OF SODA
guaranteed 15% Nitrogen, equal to 18.84% Ammonia.

ACID PHOSPHATE
guaranteed 14% to 16% available Phosphoric Acid.

Write for our prices—and also copy of the "Vanco" Book—you'll find it a big help in mixing Fertilizers. 45

CHEMICAL LABORATORIES,
148-158 Van Horne Street, • TORONTO.

Valuable Book on Barn Building FREE

Write at once for this valuable book. It contains information that every farmer should have regarding the sanitary housing of dairy cows. It explains every fundamental of correct construction and gives proper dimensions and arrangements. It describes lighting, ventilation, stable floors, and their construction, and contains suggestions about silos, site, exposures, appearance, design, drainage and inside equipment. Besides, you will find in this book a number of practical barn plans and other information that may point the way to your saving many a dollar. We have designed many of the finest and most modern dairy barns in this country and this book is based on our long experience and expert knowledge in dairy barn construction. The book contains in concise, clear and condensed form, information necessary to any farmer who is planning to build or remodel. Understand, we send you this book absolutely free without any obligation on your part—just for answering these few questions: Do you intend to build or remodel? How soon? How many cows have you? Will you want a litter carrier? Will you want a hay fork outfit? Send to-day.

BEATTY BROS. BOX H FERGUS, ONTARIO

MARKETS.

St. John.

GRAIN—Buckwheat, $2.50 to $3.00.
LIVE STOCK—Milch Cows, $50.00 to $60.00.
DRESSED MEATS—Beef, (carcass), 7c. to 10½c.; Beef, (retail), 9c. to 20c.; Mutton, 6c. to 9c.; Veal, 9c. to 11c.; Pork, 9c. to 9½c.
DAIRY PRODUCTS—Creamery Butter, 34c. to 37c.; Dairy Butter, 33c. to 35c.; Cheese, 14c.
POULTRY AND POULTRY PRODUCTS—Eggs, 22c. to 25c.; Fowl, $1 to $1.75; Chickens, $1.00 to $1.75; Ducks, $1.50 to $2.00; Turkeys, 28c. to 30c.

Charlottetown.

GRAIN—Oats, white, 48c. to 50c.; black, 50c. to 55c.
FEEDSTUFFS—Bran (retail), $1.50 to $1.60; Shorts (retail), $1.50 to $1.60; Middlings, $1.50 to $1.60; Oil-Cake, $2.50 to $2.75; Cottonseed Meal, $1.90 to $2.25; Corn Meal, $2.00.
GRASS SEEDS—Timothy, 17c. to 20c.; Com. Red Clover, 25c. to 30c.; Mam. Red Clover, 25c. to 30c.; Alsike, 25c. to 30c.
LIVE STOCK—Butcher's Cattle—5½c. to 6½c.; Stockers, $18 to $35.00; Milch Cows, $25 to $50; Sheep, 3½c. per lb.
DRESSED MEATS—Beef (carcass), 7½c. to 10c.; Beef (retail), 8c. to 16c.; Mutton (carcass), 8c. to 10c.; Pork, (carcass), light, 7½c. to 8c.; select, 8c. to 8½c.; heavy, 6½c. to 7c.
HORSES—Drafters, $150 to $225; Roadsters, $150 to $225; Carriage, $150 to $225.
DAIRY PRODUCTS—Creamery Butter, solids, 32c.; prints, 33c.; Dairy Butter, tubs, 25c. to 27c.; prints, 25c. to 30c.; Cheese, 15½c. to 16c.
POULTRY AND POULTRY PRODUCTS—Eggs, 20c. to 21c.; Fowl, 8c. to 12c.
FRUIT—Apples, $2.50 to $4.00 per bbl.
MISCELLANEOUS—Hay, loose, 75c. per 100; pressed, $12.00 to $15.00; Straw, $6.00 per ton; Wool, 25c.; Beef Hides, 10c.; Sheep Skins, 45c. to 75c.; Lamb Skins, 45c. to 75c.
VEGETABLES—Potatoes, 50c. per bus.; Turnips, 16c. per bus.

Roads have become very bad and what produce offers comes mostly from close into the city, but notwithstanding the condition of the roads, considerable produce has been brought in within the last two weeks. Hay has been offered quite freely but prices have held firm. Vegetables are beginning to move again and quite a lot of turnips are offering and few are readily sold at 16c. Potatoes are also beginning to come out and are being sold at 50c. Beets, Carrots and Parsnips are very scarce and we do not know of any being offered. Dressed Meats are also offered in smaller quantity except dressed hogs which have been fairly plentiful, but prices have held firm. Oats are very scarce and there is a wide range in prices as farmers are looking for seed, and oats of suitable quality bring prices even higher than those quoted. Eggs are beginning to offer freely and we look for further decline in price very shortly. Butter is scarce and prices firm. Cheese is about out of the market except in a small jobbing and retail way.

Trying to Get Something For Nothing Never Pays

IF you buy a separator at a very low price you get a separator built to meet that price. Efficiency and durability in a cream separator cannot be replaced by anything "just as good" at a low price. It takes brains, good material, and a well-equipped factory to make good separators. These things cost about the same price everywhere, and one company cannot secure them any cheaper than another. The difference in the price generally represents a corresponding difference in the value of the machines.

I H C Cream Separators Dairymaid and Bluebell

are as good separators as can be built. If you buy an I H C you will get more years' work out of it than you could out of any other separator, consequently it is the cheapest separator you can buy.

Extra long shafts and spiral cut gears insure durability. Phosphor bronze bushings protect the moving parts. Grit and milk cannot get into the gears, yet the gears are easily accessible. These separators are easy to turn because the working parts are accurately made and perfect oiling facilities are provided.

The bowl has the most effective skimming device ever designed, and a dirt arrester chamber which removes the impurities before the milk is separated. This insures a high grade of cream and makes the bowl easy to clean. The neck bearing is simple and trouble-proof. Made in two styles, each in four sizes.

The nearest I H C local agent will be glad to have you examine one of these separators, or, write the nearest branch house for catalogue.

S. A.

Protect the Bees.

The little busy bee is one of the fruit grower's best friends. In his search for the hidden sweets in the open blossoms, the bee comes in contact with the pollen from the anthers of the flower. This pollen is the fine sulphury like dust that you sometimes see scattered all around in the little streams and ponds in early summer when the trees of the forest are in blassom. Some of the apple blossom pollen adheres to the bee and in his rambling lrom flower to flower some of this fine dust falls from his body on the stigma where it works its way through the style to the ovule at the bottom of the flower. The ovule is fertilized by the pollen and it immediately begins to grow. It is a well known fact that when bright sunny weather occurs during the time the pollen is being emitted from the anthers of the flower the prospects are that a large percentage of the blossoms will set and form fruit. On the other hand when wet stormy weather occurs during this period the setting percentage is usually very low. In bright sunny weather the bee is always busy. He visits thousands of blossoms every day and in this way a great many blossoms that would otherwise remain unfertile become fertilized.

Of course the main medium for carrying the pollen from anther to stigma are the light breezes that blow through the trees but the bees play a very important part in assisting this work. It is therefore the bounded duty of each and every fruit grower to protect bees from poisoning by avoiding the use of poisonous sprays during tbe time the bees are working on the apple blossoms.

I leave it to the fruit growers' best judgment in behalf of his own best interests to protect the bees.—Fruit Grower, Sunbury Co., N. B.

Sickness is usually caused by the accumulation of waste matter and impurities within the body.

Dr. Morse's Indian Root Pills,

enable the bowels, the kidneys, the lungs and the pores of the skin to throw off these impurities. Thus they prevent or cure disease. 12

How the Plant Feeds.

When the plant is growing the tiny roots permeate the surface 6 to 8 inches of the soil, in the case of small grains—in corn and clover they reach from 2 to 4 or 5 feet deep, and in the fruit trees to many more feet. These tiny rootlets lie close to the soil particles, around which particles there is a thin film of water. This water contains the essential salts mentioned above, in solution. Now, the plant takes this solution up through its roots and sends it up to its leaves, where carbon dioxide, or the gas which we breathe out, is taken in by the mouths of the leaf. Under the action of the sunlight, the tiny factories of the leaf are set in motion, and the carbon of the air is combined with the hydrogen and oxygen in the water, to form the sugars and starches of the plant. The other elements are combined to form the remainder of the plant.—H. C. Bell.

Two Deputies For Ontario.

Following the appointment of C. C. James, C. M. G. as Special Commissioner to inquire into Agricultural conditions in Canada, Mr. W. B. Roadhouse has been appointed Deputy Minister of Agriculture for Ontario and Mr. C. F. Bailey, a Pictou, N. S. boy, has been appointed Assistant Deputy Minister. Mr. Bailey judged Beef Cattle at the Halifax Exhibition last Fall. He is a graduate of the Ontario Agricultural College and is, well informed in regard to the work he will be called upon to do.

Big Ben

**To sleep late's pleasant, now and then,
Make it Sunday morn—says Big Ben**

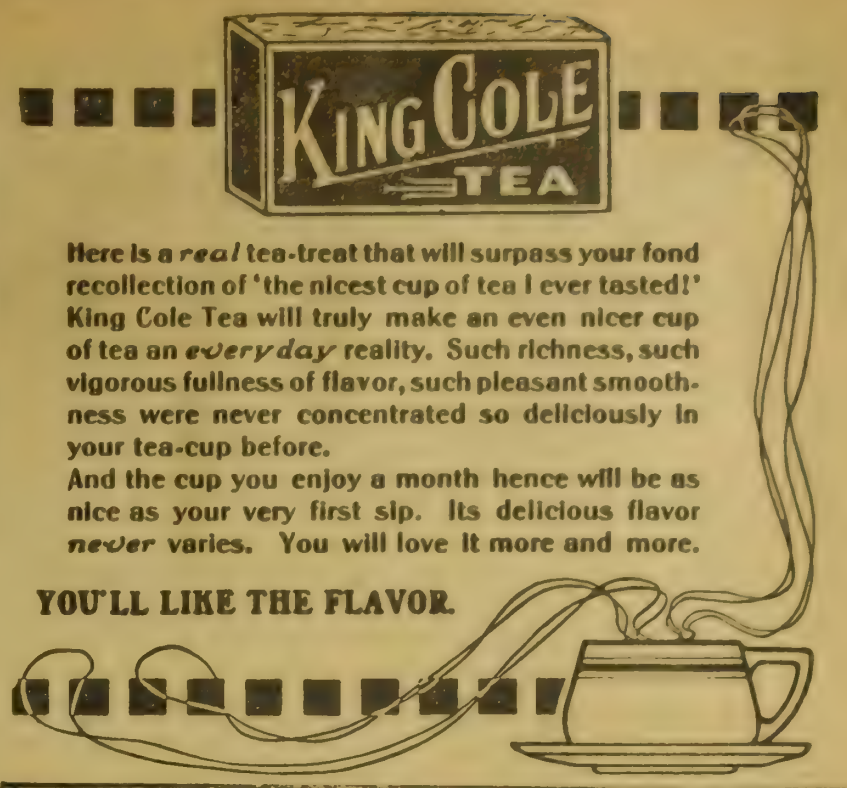
Big Ben is an alarm clock that's on the job every minute of the day. He *rings* on time, he *runs* on time, he *stays* on time.

He *weighs* three times as much as the average alarm clock, he *rings* three times as loud, he *lasts* three times as long.

He has a great big dial you can easily read in the *dim morning light*—a cheerful, deep toned voice that will wake you on your *sleepiest mornings* — large, strong winding keys that are a *pleasure to wind*—selective alarm calls that ring *just when you want* and either way you want, steadily for *five* minutes or intermittently for *ten*.

He's punctual, lasting, handsome and the best *insurance* against oversleep that's ever been heard of. His work doesn't end with the morning call, he's a good reliable time keeper for *all day* use and he's good looking enough for any surroundings.

5,000 Canadian dealers have already adopted him. His price is $3.00 anywhere.—A community of clockmakers stands back of him, *Westclox, La Salle, Illinois.*—If you cannot find him at your dealer's, a money order sent to them will bring him to you duty charges prepaid.



Here is a *real* tea-treat that will surpass your fond recollection of 'the nicest cup of tea I ever tasted!' King Cole Tea will truly make an even nicer cup of tea an *everyday* reality. Such richness, such vigorous fullness of flavor, such pleasant smoothness were never concentrated so deliciously in your tea-cup before.

And the cup you enjoy a month hence will be as nice as your very first sip. Its delicious flavor *never* varies. You will love it more and more.

YOU'LL LIKE THE FLAVOR.

CONCORD VALLEY

SPRING IS HERE
IN THE SUNNY DRY BELT

While most of you who are reading this magazine, have still two or three months of the worst part of the winter to put in

We had a wonderful winter—Beautiful—But it is the sunshine of the delightful—Bright—Warm—Dry Belt Summers—That we look forward to—there is something in it that calls for Woods, Meadows, Cool Waters, and broad porches on comfortable Bungalow's

It makes us glad—and it will make you glad—to know that wife and babies are away from the glare, the blare, and the dust, getting strong and rosy.

Y-o-u can Live, Prosper and Enjoy Life in the Dry Belt—for this is No Millionair's Dream—Because the Dry Belt has proven to be beyond doubt the greatest Fruit and Vegetable producing district in the world having won numberless prizes in competition with the whole world.

An average of 310 sunny days in the Dry Belt.

The famous Ashcroft prize potatoes are grown in the Dry Belt

The Orchard known as (Widow Smith's) produced $22,400 worth of apples from 28 acres—Last season.

Another good feature is the Absence of pests in the Dry Belt—And no less from frost.

The property we want you to invest in is—Concord Valley—25 miles from Kamloops—on the sparkling North Thomson river—each ranch within 10 to 20 minutes of C. N. R. Depot—and also a daily boat service.

If you are interested in Real Fruit land in a Real Fruit Belt you are very welcome to our Booklet APPLE GROWING Past Present and Future—Drop us a card—R-I-G-H-T N-O-W.

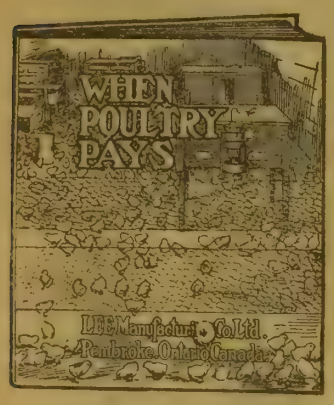
MAKE THE PEERLESS WAY WORK FOR YOU AND INCREASE YOUR PROFITS FROM POULTRY

YOU don't need to be told that the biggest fortunes are made by those who put to work for themselves, the knowledge of other people. You can put our knowledge to work for you and have The Peerless Way help you to increase your poultry-profits. Don't waste time in poultrying by trying to learn alone; begin where we have left off. Take the experience that we have acquired in operating the largest and most successful poultry farm in the Dominion—the Poultry Yards of Canada, Limited—and apply it to your own use. Over 20,846 Canadian poultrymen are now following our methods and, through The Peerless Way, with its co-operative marketing plans are selling direct to the highest-cash-price-market and making more money than they could ever have made the old way selling to the middleman or the cold storage dealer. With the supply of Canadian poultry products equal to only one-third of the demand, we have realized the need for showing farmers the big profits that lie in this field of golden opportunity. But even the 20,846 we have started right, have not made a dent in the market, so rapidly is the country growing and the demand increasing. YOU can make money in poultrying—right now; and you can make greater profits every year. The Peerless Way will teach you how you can duplicate our big success, how you can increase your output at higher prices and how you can double or treble your profits.

"WHEN POULTRY PAYS" is a book that tells how you can put The Peerless Way to work for yourself. Please observe that this book is not The Peerless Way itself; it is the history of The Peerless Way, rather. It does tell, however, of the success of hundreds who have adopted our methods and of how we, ourselves, have made our own poultry farm grow to the biggest in Canada; and it tells how your own success can be made to equal ours.



Send The Coupon For This FREE Book

"When Poultry Pays" tells you all about the Peerless Incubator and Brooder which have made The Peerless Way possible; it tells you why you cannot make a success of Canadian poultrying with incubators and brooders designed for warmer climates where there are no long, cold winters, and just how and why the Peerless is adapted to this climate. Remember, this book is a practical, common-sense treatise throughout and to the man who has a little money, average common-sense and a willingness to look after his business, it is a genuine guide to an unworked field of profit right at his own door.

Our Co-operative Marketing Plan Will Get You Higher Prices

THE extra few cents' profit that you might have had—but which go to the cold-storage buyer and middleman—represent but a small per cent. of your total selling price. But they represent a very, very big percentage of your profits—and it is profits you are after. Through our Co-Operative Marketing Plan, we can put you in touch with buyers who will take your whole output—great or small—at highest, spot-cash, market prices and charge you no commission. This is merely one detail of the service of The Peerless Way.

Profit Lies In Knowledge—Let Us Show You

IF you are keeping poultry now, you may not be able to see how you could double or treble your profits. If you knew how, you would do it—naturally. But you don't *know*. The Peerless Way will teach you the organized, highly systematized methods that govern the largest and most successful poultry farm in the Dominion—the Poultry Yards of Canada, Limited. It will not only show you how to raise more poultry and increase your egg production, but it will also show you a market twice as big again as your present market—and will show you how to take advantage of it.

20,846 Poultrymen Follow The Peerless Way

IN every part of Canada are followers of this new method of more intensive poultrying. They have succeeded. You can, too. All you have to do is to follow the instruction given free by our Poultry Advisory Board and you can't fail. Or, if you prefer, you can come to Pembroke and, for a moderate tuition fee, take a special course at our poultry farm. But don't get the idea that you must do this; you can learn just as much from a careful study of The Peerless Way right at home—use the coupon.

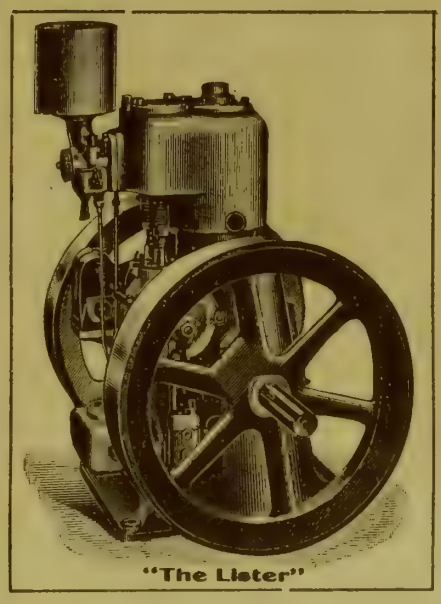
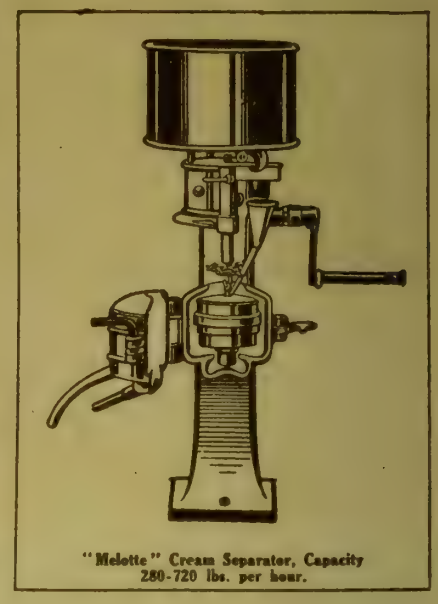
The Engine You Have Been Waiting For



"The Lister"

The "Lister" Vertical Gasoline Engine



"Melotte" Cream Separator, Capacity 280-720 lbs. per hour.

The "Lister" Engine is designed especially to provide the agriculturist and small power users with an efficient, simple, safe and durable engine capable of being operated by the average farm hand.

The CYLINDER, PISTON, VALVES, GOVERNOR, CARBURETTER, etc., have special features making for efficiency under all conditions as well as for durability.

IGNITION

The "Lister" Engine is fitted with the famous High Tension Bosch Magneto Ignition which eliminates the frequent delays, expense and annoyance of inferior system of ignitions.

LUBRICATION

A small pump distributes the oil automatically and continuously just where needed.

SPECIAL ADVANTAGES

SIMPLICITY, ACCESSIBILITY, QUALITY, ECONOMY, INTERCHANGEABILITY of all parts.

These features make the "Lister" Engine pre-eminently suited for grinding, pumping, sawing, threshing, elevating, sheep shearing, etc., etc., for contractors, for work shops, for electric lighting, in fact for any power service.

The "Lister" Gasoline Engine

is another production from the works of R. A. Lister & Co., Limited, Dursley, England, made famous originally by the Alexandra Cream Separator and in later years by the

MELOTTE

now known as the King of Cream Separators.

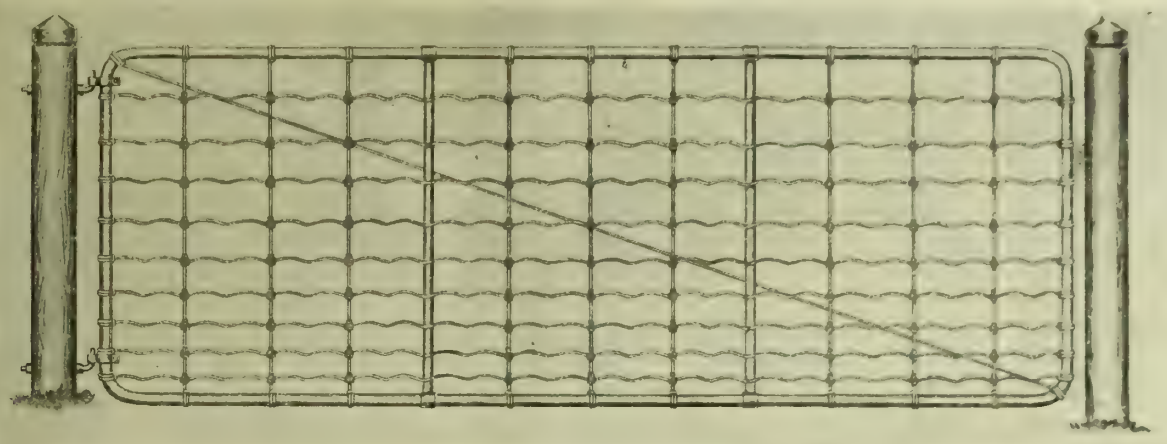
Good Wire Makes Good Fences

What have you been buying in the way of wire fencing? Have you been getting your fences from outside manufacturers or have you been patronizing a local industry, which some years ago demonstrated that it builds the best fence on the market.

Our wire is especially bought for the climate conditions of the Eastern Provinces, and we have taken into consideration the quality of the wire as well as its construction when endeavoring to put out a fence that will last.



The Straight Stay Fence

This is without exception, the best stiff upright fence on the market. We use the same high grade quality of wire and for those preferring a fence of this pattern we recommend the "Straight Stay."

This is also a woven wire, Factory Made Fence

It is a WIRE LOCK and a GOOD ONE

Lawn Panel Fencing **Steel Frame Gates** **Steel Fence Posts**

Coil Spring Fencing Wire **Fence Staples**

We make the Best Fences for Lawns, Private Grounds, Cemeteries, etc.

YOU WANT TO

Make Money

Dividend of 10% assured the first year

Five going concerns have decided to amalgamate for the purpose of not only making more money but so that they may expand and thus be in a better position to handle their increasing business in all Canada.

Each of these concerns are making good on the capital invested and it is estimated that under the proposed amalgamation that money will be saved both through the buying and selling ends and also that expenses will be cut in two, that it will be possible to earn dividends of 20 per cent in a short time.

During the next few years there will be millions of dollars spent in Canada and it is the object of these concerns to put themselves in a position to get a large share of this money. This could not be so easily accomplished if each were to operate separately.

Each of the five concerns are engaged in separate pursuits consequently no market condition can effect more than one at a time. Each are handling lines that are in daily use. The object is to have the stock of the company as widely distributed as possible. It can only be purchased in not less than $100.00 shares and not more than $1000 to one person.

We are not selling stock as a favor to the buyer, but because with additional capital the company can make money very fast.

The control of the company will be in the hands of incoming investors and the new capital is to provide for expansion.

Every Investor has an opportunity to assist in developing business and when 400 new families become customers there will be a further earning of 20 per cent. to investors.

We have no time to waste and our object of advertising in this way is to secure the names of parties that are desirious of a safe investment.

The company will be under the management of a man and a directorate that will bear the closest scrutiny. Everything will be made clear when we answer your communication.

If you have money that is not earning what it should please fill in the enclosed coupon and mail it today.

I have Money that I want to invest in a safe way and would be pleased to have you send further information.

This Does Not Bind Me in Anyway.

TREES Grow Better Yield Bumper Crops Without Fertilizer

WHEN

the land has been prepared by Stumping Powder

A tree hole can be excavated in an instant with Stumping Powder. It would take a man several minutes to dig it. And then the spaded hole would be hard all the way down, making it difficult for transplanted roots to take hold. This is one of the chief reasons why transplanted trees so often die.

The accompanying illustrations show the wonderful difference in growth in "blown" and hand-dug holes.

No. 3— Bing Cherry Tree Set in Dynamited Hole

C. X. L. Stumping Powder

renders the fertility in the land available. It makes the sub-soil porous allowing root growth. Makes it absorb plenty of water in rainy weather, conserves the water in periods of drought, and this water is the source of the vehicle which carries the plant food. This water in the open, blasted soil is carried to the top by the roots of the plants or trees as needed for their growth.

No need of expensive fertilizers when you use Stumping Powder.

A whole row of tree holes can be excavated in an instant when charged with Stumping Powder electrically exploded.

Our Illustrated Free 120 Page Book

Tells you how to clear land of Stumps and Boulders. How to break up Hardpan, Shale, or Clay Subsoils; and **SAVE TIME and MONEY** by using Stumping Powder in digging Cellars, Wells, Drains, Ditches and Reservoirs. Regenerates old worn out farms and makes the fertility in subsoil available to plants.

No. 4—Bing Cherry Tree Set in Spaded Hole

QUITE SAFE TO USE

Our handsome, illustrated Book tells all about it. Send a post card for it today.

It is free. It shows you many photographs of just how things are done.

TRADE in your old separator on account of a new

DE LAVAL
CREAM SEPARATOR

38,796 Users did so Last Year, 26,569 in the U. S. Alone

It's come to be an accepted fact that DE LAVAL cream separators are as much superior to other separators as other separators are to gravity setting systems, and that an up-to-date DE LAVAL machine will on an average save its cost every year over any other separator.

Aside from the actual saving in more and better cream and butter and in time of separation and cleaning, easier running, greater durability and less repairs, there's the pride, comfort and satisfaction which none but the owner and user of a DE LAVAL machine can feel in his separator.

In consequence thousands of users of inferior and worn-out separators of various makes take advantage every year of the educational allowances which the DE LAVAL Company continues to make and trade in their old separators.

APPLIES TO OLD DE LAVAL USERS ALSO

While all this applies particularly to the users of inferior separators it applies likewise to the many thousands of DE LAVAL machines 10 to 25 years old. They are not worn out and are still superior to other new machines of today, but there are so many improvements embodied in the modern DE LAVAL machines that these old DE LAVAL users can well afford to make an exchange and soon save the cost of doing so.

SEE THE NEAREST DE LAVAL AGENT

He will tell you how much he can allow on your old machine, whether a DE LAVAL or some other make, toward the purchase of a new DE LAVAL. If you don't know a DE LAVAL agent, write to the nearest DE LAVAL office giving make, number and size of your present machine, and full information will be sent you.

The Steady Growth of the Mutual Life of Canada

Is convincing proof of the confidence in which it is held by the public. The Mutual Life of Canada is an exceptionally good company in which to insure, judging from the annual report which shows among other things :

That the expense rate is remarkably low, the economy of management adding in no small degree to the surplus earnings which means larger dividends for the policy holders.

That the average rate of interest on investments is high, and has again increased, adding still further to the profits earned by the policies.

The following tables are also worth careful study and consideration, if you are about to take out life insurance :

Phenomenal Growth of Business

	1886	1911	INCREASED
Income - -	$ 272,000	$ 2,450,000	Nearly 10-fold
Interest - -	43,000	875,000	Over 20-fold
Assets - -	905,000	18,131,000	Over 20-fold
Insurance in force	9,774,000	71,000,000	Over 7-fold
Surplus - -	61,500	3,312,000	Over 50-fold

How I Grow Potatoes on a Business Basis.

By C. Fred Fawcett, Upper Sackville, N. B.

Awarded First Prize in The Maritime Farmer's Potato Growing Contest.

IN TRYING to tell MARITIME FARMER readers how to grow potatoes on a successful commercial basis I feel that youth should give place to old age—however I will set down a few things as to my system as I have had to keep my creditors satisfied from the results of my labors.

Suitable land for potatoes is below its value in this section. The initial cost of a thirty acre field I have was about $12.00 per acre. This, we feel, is away below the actual value—however, some other fields that I have known of can be purchased around this figure in this section. In selecting our potato soil we look for a sandy loam well drained, by natural means, if possible. This soil seems particularly adapted to grow nice clean, white, smooth stock. Potatoes do well on a variety of soils but the above is my preference. If a field is known to be wet and likely to be kept so by a rainy summer, I would not plant potatoes there. A field that has a clay subsoil is also not very suitable as the water cannot get down and often is more like soup than a potato field, in a wet fall. We always try to provide a clover sod for our potatoes but of course, if this is not available any old sod field will do that is not too tough altogether. I well remember one of the first fields I ploughed up for potatoes. It had not been ploughed for upwards of forty years and one neighbor told me that he would be able to put all the potatoes I could grow in that field that year in his hat. I don't think he ever tried to do this, however, as the field turned out about one hundred barrels to the acre. Sod is the place for a potato crop every time but be sure and leave the sod under where it was put and not go bobbing up and down with a plough trying to make furrows for potatoe rows. With a clover sod to a person not used to it, there will come visions of stored up available plant food and big crops. Just try it and then write me if you find what I tell you is untrue.

From close observation I am almost led to believe that on my particular farm spring ploughing gives me the best results. I would not lay this down as an absolute guide for others because I believe every soil has differences. Heavy soils would probably be, and are benefited by fall ploughing—but as I said before, when there is a good growth of grasses started and this is turned under fairly deep, say four or five inches, and the pototoes immediately gotten into the ground, we have fulfilled part of the conditions at least, favorable for a profitable crop. Early fall ploughing has its advocates and good results are obtained but in either case the land should be harrowed thoroughly immediately after in order to do the most effective work with the least possible outlay of expense. In harrowing our soil we are very particular to have it thoroughly done. We use the disc, spring tooth, drag harrow and leveller in the order named. We harrow both crosswise and lengthwise and sometimes diagonally. We are never satisfied in caliing a sward field done until we can go along and find no ridges with the heel of our boot when we draw it crosswise of furrows. Some fields require more strokes than others to bring it into this condition but we find from six to eight strokes generally sufficient.

Machine for Distributing Fertilizers.

Last year in our large field we used four horses on the ordinary two horse disc harrow and with disks set at full angles and a two hundred pound man on seat we were able to accomplish very effective work and in a minimum of time. I find a four horse team for many other various farming operations a money saving contrivance. We haul to the car with this team and thus save a man's wages. After the last stroke of the smoothing harrow which leaves the field as near level as possible, this ground is ready for planting. This will be from the middle to the last of May in an average year. We have planted in April but for general farm work about the 16th of May is time enough.

Up to this time I have said nothing about fertilization. This is a question upon which there is a great difference of opinion. Many old farmers prefer barnyard manure. With me, it is impossible for my acerage and I depend entirely for fertilizing my potato crop on clover and commercial fertilizers. However, I know manure that is well rotted, or which is applied in the winter, will add greatly to the crop. Heavy applications of green manure spread broadcast and also in some seasons when the manure has been put in the furrows and the sets dropped on that, has been very disastrous to the crop. Green manure seems to tend toward making the potato watery or we might say waxy. Good commercial fertilizer adds greatly to the quality of the potato and so we apply our manure to other crops. However, this winter I was fortunate enough to get a large pile of manure from some lumber camps near by and we are certainly going to make the most of the opportunity. I believe that if a person were so situated that black muck could be procured that this would make a valuable adjunct to the humus content of the soil where this work can be done conveniently and cheaply in the winter season. We have done some work along this line and so far as we can tell, with splendid results.

The choice seed patato has two, three or four sets with about two ounces of meat on each set. We like our sets large, junky, cut the same day as planted and coated with land plaster. I have increased my yield wonderfully with selected seed, gotten by careful breeding year by year. The sets and fertilizer are now made ready and taken to the field. We would not suggest any one planting several acres of potatoes to follow the hand dropping system and therefore in this we will only consider the modern potato planter. This machine furrows out the row, drops the set, and fertilizer and covers in one operation. You start at one side of the field and go backwards and forwards until the field is done. We use from one half to three quarters of a ton to the acre of the best grade of potato fertilizer and have found a second application to make very decided improvements after the vines are up. A fertilizer containing four per cent. ammonia, seven to eight per cent. phosphoric acid and ten per cent. potash (K_2O) has the necessary amounts of suitable plant food, when applied at the above rate per acre, to supply a little more than the necessary amounts required for one csop. The sets are dropped for big crop production at about fourteen inches to fifteen inches apart in the rows about thirty-four to thirty-six

inches apart. The machine then with a driver and man behind to guarantee one set in a place and one set in each place, proceeds to go over our field at the rate of about four acres in ten hours. To a person wishing to follow somewhat in this system and not having a planter, we would suggest using a marker made from a deal with pegs through at right distances for your rows and shafts and handles attached and mark out his field with this. Then drop the sets and fertilizer in these marks, cover them with a horse hoe. While this is slower and a little more tedious, yet the result will be practically the same as those derived from the use of a machine. The potato hoe is an absolute necessity later in the cultivation and thus this machine can be made to serve two purposes. We think a good practice in dropping fertilizer and sets by hand is not to allow the sets to come in direct contact with the fertilizer. We have noticed bad results from this and as a remedy would suggest that a spruce bough or chain or broom be dragged after the fertilizer and before the sets are dropped. If planting with a plough, a chain may be arranged by having a stick tied crosswise the beam and chain hung from end of same. We notice when potatoes are planted with a machine and by the old system of the plough that there is about a week's difference in the vines appearing above ground. We attribute this to the more heat the machine planted potatoes get on account of being nearer the surface. Even the harrowing down of the plough planted potatoes does not seem to have the same effect as being planted nearer the surface as with the machine. From the time the set is dropped we want no delays to take place in its growth as in ninety days the crop must be matured and a few days' loss in backward growth means a serious loss in the potato bin in the fall.

In cultivating we find the one and if possible a two row cultivator and a potato hoe practically the only tools necessary. The potato hoe follows the cultivator and about five to seven times of each machine going over will generally keep the weeds down and insure freeness from crust after rains. We never hand hoe our potatoes but sometimes have pulled out some big weeds by hand. This can be done very quickly and prevents them from going to seed. Last season we top-dressed our field with fertilizer and with the potato planter after the vines were about four inches high. The disks covering the tops completely. New roots formed at the top of the former row and the vines made a splendid growth afterwards. I shall follow this system this year.

To spray a large field cheaply, effectively and quickly a power machine is almost a necessity. With this machine an acre can be sprayed in about twenty minutes and a horse furnishes all the power. A few hours delay when the bugs are bad will mean dollars of a difference in the crop. Last season we used arsenate of lead and I believe in this substance the potato grower has something that can be used very effectively on the young vines so that it will be there ready when Mr. Bug appears. I was well satisfied with the work of the lead last season and am going to use more of it this year. We, of course, spray for rust. By watching this very carefully we think that two applications and sometimes even one, has been very effective in stopping its ravages. We use the bordeau mixture for rust and with the addition of the lead or paris green, the potato pests can be kept in check. I find some farmers in preparing bordeau mixture think they know more about it than those who prepared the formulas. I always follow them very carefully and have no trouble later. Following the above outlined plan I have no trouble in growing one hundred and twenty-five barrels and upwards to the acre.

Harvesting the crop, of course, is the potato grower's delight and in the long rows the modern elevator potato digger can roll the crop out in great shape. Five or six pickers with a machine and horses can handle this end of the work in fine style. The potatoes are not sorted in the field but are picked in barrels and with a low waggon they are easily handled and hauled to the storage room. We want our pickers to average thirty-five barrels per day and like to keep as close to the machine as possible so as to avoid the greatest amount of sun. We like to dig and store our potatoes for about five to six cents per barrel but everything has to work pretty smoothly for this to be done. The sorting and grading is done at the storage room. Even for this a machine has been invented that beats tired fingers and sleepy eyes all to pieces. With a man to shovel, one turning the crank, one looking after the nubby, frozen or rotten tubers and one rolling barrels or taking bags away, the sorting and grading can be accomplished at about forty or fifty barrels an hour. Of course if the stock is to be shipped in bags, these will have to be sewed. The potatoes are now ready for market. A car is ordered, teams are on hand and away goes the potatoes at the rate of a carload a day. This makes work for everybody and also makes everybody work to do his part and I find it is the most satisfactory way to haul and load potatoes. We pay so much per barrel for hauling and the work is all done cheaply and efficiently on account of system and good planning. Grabs and blocks for hoisting the barrels into the car are a great labour saver where there is no loading platform. Of course what potatoes are stored for seed or held for seed purposes are taken direct to cellar or potato house from the pickers. Then the sorting can be done in the winter time or stormy days. A frost-proof storage house beside the track is about the only satisfactory solution of keeping stock over the winter. In any storage place, however, the floor should be plank or cement so a large potato fork can be used to shovel up the potatoes as this is one implement absolutely necessary to raise potatoes commercially successful. In my regular farming operations my potato crop appears on the same land every third year, clover and grain are the alternatives. From careful accounts kept I find that I have produced and loaded on the car my potato crop for forty-five cents per barrel, figuring everything as fine as I could.

Now a word as to varieties and I will stop. Ontario is our strongest competitor and the main thing that the shippers there complain of is so many varieties. It is very difficult to load a car at any one station of the same variety and uniformity counts for a lot in getting the best market prices. We are a young potato producing people here in New Brunswick and have only gone in for a few good selling varieties. This is the secret of the great popularity of the New Brunswick "Delaware" or "Green Mountain" in the big markets of Canada. Stick to a few varieties of which the "Delaware," "Green Mountain" and "Irish Cobbler" are good types and if you follow the general plan above outlined, I know that when the market is soaring around the dollar mark you will have some to sell.—C. Fred Fawcett.

What New Brunswick Has to Offer the Immigrant.

An Address by S. L. Peters, Queenstown, N. B., at the Recent Immigration Congress.

No greater tribute could be paid to New Brunswick, than the addresses of the Gentlemen who have preceeded me. It has been a great delight, to hear from every speaker: that in his judgment, his home section of the Province is the very best. It certainly goes a long way to prove that the general conditions are all exceedingly good, and that in our Home Land we enjoy so much of the good things of this life, that we are not only contented and happy, but wish to spread the good news, that others may share in our blessings.

To the Members of the St. John and Fredericton Boards of Trade, who have taken the initiative in getting this very large and representative Immigration Congress together, I wish to extend my heartiest congratulations.

Permit me now to refer to some of the things which New Brunswick has to offer the intending Immigrant.

An invitation to the intending immigrant to locate and make his home in New Brunswick is very naturally met with the question, "Well, what have you to offer me as an inducement to do so?"

The enquiry is a natural one and should be met by a frank and truthful statement of the facts as they exist. No over-drawn picture or statement is allowable, for, if made, is sure to act as a boomerang and strike back with damaging effect.

Happily for New Brunswick, we only require to make a plain and truthful statement of our conditions as to the general good health of her citizens, so largely entranced by an abundant supply of pure water, and a fine climate, which insure a vigorous manhood. "To the fruitfulness of our soil and its productive qualities." "To the wide opening we have in our home markets, and the nearness to the world's best market, England, for our surplus products of the farm and the forest." The almost inexhaustible supply of our Iron Ore in Gloucester and Carleton Counties, and the Coal Deposits in Queens and Sunbury, the large area of limestone around the Harbour of St. John, the inexhaustible supply of Gray Granite on the St. John River in the Counties of Kings and Queens, and the Red Granite at St. George in the County of Charlotte; to the enormous supply of Natural Gas and Oil Shales in Albert County which is destined to revolutionize the cost of power to manufacturers within a radius of from 75 to 100 miles and furnish light to the cities, towns and homesteads in its vicinity. To the value of our deep sea and inland fisheries; to the wealth of New Brunswick soil on which apples and other fruits can be grown with the greatest success,—a success which is assured first because of soil conditions, second, because of the bright sunshine with which New Brunswick is so largely blest, giving a crispness and flavour, and with all that beautiful colour which will be forever an outstanding feature of New Brunswick fruit, and will prove an important factor in forcing its way on every market on which it may be placed.

A Street in Gagetown, Queens Co., N. B.

Soon to be changed to a bustling centre A large canning factory is proposed for Gagetown, which is one of the best fruit growing centres in New Brunswick.

So bright is our sunshine; and so full are its health giving properties to all animal life that we should be the most happy and contented people in the world, in

"SUNNY NEW BRUNSWICK, THE LAND OF COMFORTABLE HOMES."

These are some of the things we have to offer intending settlers, but not all. Here we enjoy the inestimable privilege, and blessing as well, of the best system of Government in the world,—citizens of the British Empire having a residence in the Dominion of Canada and in one of the best of its sub-divisions, the Province of New Brunswick; absolute protection to life and property in so far as wise laws and their wholesome administration can give effect; a splendid educational system as worked out in our District Schools, the Superior and Consolidated Schools, the Normal School and our University, to which we hope to add in a not very distant day an Agricultural College and an Experimental Farm. We shall then be fully equipped for good work. It would be unpardonable for us to omit to refer to the great privileges we enjoy and have to offer intending settlers in the blessings and influence of the Christian Church, which is so

(Continued on page 517).

A Land Settlement Policy For New Brunswick.

An Address Delivered by

Charles H. McIntyre, of Boston.

Before a Convention of the Boards of Trade, Agricultural Societies, etc., at Fredericton, N. B. March 8th, 1912.

Mr. C. H. McIntyre.

THIS Convention is indeed a unique event in the life of New Brunswick. For many years I have been looking forward to this day, when the men of the Province, representing her predominant interests, would meet together for a serious consideration of her problems and their solution. Sometimes I have been almost dis couraged as I have watched the conditions growing from bad to worse, with no prospect for their amelioration, and an apathy indifferent to all ideas of reform. But when I received your kind invitation to attend this Convention, I made up my mind that I would throw all pessimism to the winds, and put my shoulders to the wheel for the advancement of my native Province. I rejoice, therefore, to be in your midst to-day, and as I look upon this audience which represents so much of the intelligence, the industry, and the ambition of our people, I take new courage and hope. The hour of destiny has arrived.

As I have been out of the Province for many y?ars I cannot pretend to be as fami,iar with all local conditions as you are. But a frequent bisitor I have been,and probably always will be, and while travelling over the Province I try to keep my eyes open, to note any changes, and to rejoice with you in any genuine progress. I come, therefare, not to lecture you or to ,ament over the Past. I come rather to take counsel with you and to see if from our mutual deliberations, there may not spring some proposals which if put into action will change the face of this Province and the spirit of her citizens, so that the observer of to-day would ina few years hence hardly know that it was inhabited by the same people.

THE PROBLEM STATED.

I need not tell you that we have been well born. I venture to assert that there does not exist in the world to-day a country, state or province that was founded by a finer class of people than those men and women who settled in this Province. For intelligence, industry and capacity they could not be surpassed. To the racial strains of English, Scotch anh Irish Stocks there was happily blended the blood of the Puritan and the Cavalier. As pioneers they were signally well-fitted to become the responsible founders of States. But somehow since the middle of the last century, the growth of population in the Maritime Provinces has not been satisfactory. I do not mean to say that increase of population is necessarily the greatest boon to a nation. I have no sympathy with this madness for bigness which is so prevalent to-day. But a sound and healthy growth is undoubtedly requisite for the efficiency and influence of any community. Judged by all reasonable standards, I think we must admit that our Province,—and indeed the Maritime Provinces as a whole—have not grown in population as they aught to have done. Let us look at the facts of the case.

In 1870 New Brunswick had 285,000 people; to-day she has only 351,000i Between 1881 and 1891 her population absolutely stood still, and during the last decade she has added but 20,000. The same condition of affairs has prevai,ed in Nova Scotia, and at this moment there are less people in Prince Edward Island than there were forty years ago. The total population of the Maritime Provinces was 772,000 in 1871 and but 937,000 in 1911, or an increase of about 22 per cent. in forty years.

Compare that, if you will, with the growth of New Zealand,—that wonderful little Dominion, far off in the Pacific Seas. In 1870 New Zealand had a population of but 248,000, or about one third the number of inhabitants then possessed by the Maritime Provinces. To-day her fair islands are filled with one million happy and progressive people—representing an increase of 40 per rent. in forty years. Nor is this the only unfortunate feature of our growth. It is still worse to report that only the cities and towns have advanced and many of the finest agricultural counties,—like King's, Albert, and York,—have absolutely declined in population during the past few years. The movement from country to city has taken possession of our people as it has in all nations, and we find the number of people who cultivate the soil constantly diminishing instead of increasing. The number of vacant and abandoned farms has increased rapidly so that there are estimated to be to-day some 3000, with an aggregate of 400,000 acres. Annexed to my address in Tables "A" and "B" you will find the story of this decline. Rural life and country pursuits, with that superficialty which is so common, have been flouted and spat upon. The farmer has been looked upon as a sort of clod-hopper instead of a prince among men. Education has been given a twist, which inevitably drives the people from the land. The sickening view of life has been preached everywhere, that if you want your boy to be a gentleman, give him an education so he will never soil his hands. We have encouraged him to seek the gilded heights of college halls and city life where many of them have become little more than genteel "paupers" who neither toi, nor spin. We have, in short, preached a lalse view of life. We have put the emphasis on the wrong place. We have forgotten the primal fact that from the earth and her products man draws his sustenance, and upon them as time goes on he will ever more depend. After more than twenty years' residence in the most intellectual city on this continent, I beg to affirm that the big city as a breeding place for men is played out, and I heartily endorse the truth that Rider Haggard uttered in Ottawa a few years ago—"that truth, that essence, that fibre, that marrow, is that you must get your people on the land out of the cities, and keep them on the land there to multiply as God commanded them of old."

Last year Canada received about 350,000 immigrants, of whom 142,000 came from Great Britain. Through the port of St. John alone some 40,-000 newcomers passed, and out of all this swarm of people but a few hundred settled in New Brunswick. With a well-watered country, a temperate climate, and many thousand acres of suitable land, we let all this host sweep by us. The Maritime Provinces are nearest to the mother country; and though intensely united to her by ties of blood and kinship, they have not secured anything like their proper share of British immigrants. This is not a satisfactory result.

Turn to the question of high cost of living. What is at the bottom of the present agitation and unrest? Why are we denizens of the city haunted with bills and expense, from the time we rise in the morning until we go to beh at night? Why are so many men in the prime of life out of employment or filling our charitable institutions? Why are there so many applicants for every vacant job in a great city? If you advertised, even for a stenographer, the chances are that you would need the police next day to clear the corridors from the mob of necessitous but worthy young women. What is it that creates our charitable work and throws such a mass of incompetent and shiftless humanity upon our shoulders? I answer that food products are primarily high because there is not enough produced. There are too many parasites in the cities and too few producers on the land. There are too many people haddled into small areas of our towns, living on an uncertain wage, when they should be cultivating the soil and adding to the world's wealth and happiness. As the population increases living expenses in large centres, are bound to increase, and unless we wake up and arrest this evil our national troubles will increase rather than diminish. In the last analysis our population is improperly distributed, and our civilization is wrong end-to.

THE REMEDY PROPOSED.

Many remedies for the existing state of affairs have been proposed. Some of them are excellent and some are impracticable. I will not stop to discuss them here. But the question arises, what is the supreme remehy for this critical situation in country life and agricultural affairs? What is the most effective means of settling people on the land, regenerating our rural life and promoting the welfare of the Province? After careful consideration of this problem, I have come to the conclusion that the most effective agency of revival would be cheap capital on long terms of credit. There are many other necessary things, but without the living water of capital you cannot achieve any substantial results. Farming today has become a business which requires not only knowledge, but money. The turnover of the cultivator, in these Provinces at least, is not rapid. He cannot be cramped with short terms of credit and high rates of interest, which sooner or later lead him to the poorhouse. Speaking generally the average young man without funds cannot purchase a farm and from its proceeds redeem himself from debt before he is worn out. This is a wrong state of affairs, and it is the business of the state to correct it as speedily as possible.

The present banking system of the country is not adapted to the necessities of farmers. It does not encourage people to settle on the land and it does not provide the capital or credit they require. The private wealth of the country is not available in sufficient amounts at cheap rates and for long terms. Business men in other callings can secure a rapid return of their loans, and naturally they will not wait upon the farmer for years. Another thing the farmer requires is moderate payments at fixed periods. If these are within his ability he can ascend the ladder of achievement and rest secure. Here then is where the Province must step in with the united credit of all the people, and furnish what private individuals cannot.

(Continued on page 521).

The Outlook for Horse Breeding in New Brunswick.

With Particular Attention to the Draught Type.

By Morris Scovil, Meadowlands, N. B.

At the Recent N. B. F. & D. A., Fredericton, N. B.

THE subject I have been asked to speak to you on is one that has been dealt with so often at the various meetings where farmers congregate from time to time, and by such able men, that I fear I have a task before me to make this effort of mine practical. I wish to confine my remarks chiefly to the subject of the draught horse in New Brunswick, its present state and what the outlook is for the future.

I think the average farmer is more interested in the horse than anyone else to-day both from a practical and financial point of view. Practical for the fact that if it were not for the horse, I would venture to say there would not be many farmers; financial by reason that there is probably no class of farm stock that pays like the production of good horses. After all it is the individual farmers that the supply of horses must come from, that is farmers carrying on a general farm practice at the same time raising what colts they are in a position to, every year. Some men are situateh both financially and otherwise to go into the horse breeding business as a specialty just the same as poultry men go into poultry exclusively. No doubt this is a highly profitable business, but how many farmers situated as we are here, are in a position to go into this line of horse raising, without a large capital and expensive plant. So it does not seem to me that it is to these large breeders that the world must look for its general supply of horses, but rather to the individual farmer, therefore if he is to take advantage of this condition it is up to him to raise the horse that the market demands and the horse there is the most profit in for himself.

It is right here that we will ask ourselves what are the most profitable horses to raise. We have to study our own interests as well as the market demand. I am not going to advocate for everyone to breed draught horses. Nor light horses either, but we must look how we are situated and then look at tne demand on the market for the different classes of horses to-day, and see what kind we can raise to give the most satisfaction all around.

Horses may be divided by the farmers into three classes. The heavy horse or agricultural horse, medium or general purpose, and light which comprises the drivers, racing and saddle horses. The latter two I think we may eliminate from the farmer's point of view in New Brunswick at least. No doubt there is some demand for this class of stock, but the average farmer has not got the parent stock to produce this class, besides the risk of raising them to maturity is much greater than the heavier animal, that it is probable that tne farmers as a rule will not go into it extensively.

As I said before I wish to consider the draught horse chiefly. Let us see what the demand is for this type. Not so many years ago when the auto came into prominence we heard on all sides that the horse would go, but we find to-day that the horse is in more demand than ever, and probably the most insistent demand is for the draughter. One can get $150 for almost any kind of a horse, while a draught animal from 1400 up will bring from $200 to $400. I know of a man in St. John recently, looking for draught horses in the province, who could not get what he wanted, going to Montreal and there paying $750 for a matched team, and this is no exception. They were big, but why cannot we raise just as big horses here, so when a person wanting one of this type can get it here, and not have to go outside the province, thus keeping the money in circulation at home.

Fall Ploughing in Carleton County, N. B.

A scene on A. A. Margeson's farm at Centerville, near the line of the proposed St. John Valley Railway.

I have before me figures from the Farmers' Advocate showing the prices ruling for draught horses in Canada to-day. I may also read the prices for other horses as well.

Surely the figures above mentioned will show anyone that the animal that fetches the biggest price is the draughter, except perhaps the choice saddle and carriage horses, but mark you it is only "choice" in every sense of the word that brings the price. There seems to be little doubt in my mind that the big horses are the ones for the farmer to raise. Another thing to be considered is that large horses are much earlier to mature than the light horse, and a three-year-old heavy horse, or mare may be able to earn part or all of its keep by doing work around the farm, as it is seldom that a commercial buyer wants a horse under 4 years. Looking at it from the farmer's point of view the great question of saving labour is of utmost importance if we are to run our farms on an economical basis. With hired help scarce and unreliable, and expensive at that, it's by heavier machinery of greater capacity that this difficulty may be partly overcome. With this heavy machinery comes the problem of horse power, and it is by keeping the heavy horse on the farm that this may be solved. If 3 big horses will do the work of four small ones, then surely it is to our advantage to have the 3 big ones. In fact look at it in what way you will you will find that on the farm the heavy horse is needed every time.

You will note that the heavier the horse is the bigger is the price. It is just as easy to keep a horse of 15 or 1600 as one of 10 or 1200. They eat very little more than the smaller horse, and in the end when we wish to dispose of them we have something for the trouble of raising them. Again there is the risk of raising any kind of a colt, they are liable to all sorts of accidents and blemishes. In the heavy horse these minor blemishes detract very little from the usefulness of the animal, where in the light horse, it may make him unfit for sale, or at least cause him to be disposed of at a loss. Then there is the breaking of colts to be considered. We all know a great many horses are spoiled at this critical time. With heavy horses, as a rule, they can be put in beside a steady horse and go off as if they had always been used to it. Whereas in the lighter breeds they are of a more nervous high-strung disposition, and frequently cause trouble.

We may wonder what the market outlook is for the draught horse, indeed for all kinds. Whether there is not the possibility of the price dropping to the level it was some years ago compared to the prices to-day. It is no wonder that horse breeding was curtailed. I don't think there is any danger of the price going down for a good many years, and this seems to be the opinion of men in a position to know. With our great Western Provinces filling up every year the farmers must have horses to work their lands. So there is a ready market for our surplus production, (if we had any). I was talking to a large dealer not long ago, and he told me that he looked for higher prices than ever this year. We have not even begun to fill our own markets with horses. Carloads are being shipped into St. John all the time, and find ready purchasers at fancy prices. These buyers would not go outside to get them if they could get them here. Even the demand right in the country amongst the farmers and lumbermen often cannot be met and horses are being imported solely for the reason that we are not raising them.

The prevailing impression in these parts, indeed all over is that New Brunswick is on the eve of great development, both industrially and agriculturally. We can see for ourselves that with this coming boom, that horses will be required more than ever. Railway construction will take a great many horses, besides the commercial developments of the province. New lands right around here are being settled and with immigrants coming into the province and new lands being opened up and farms established we may look to a great demand for horses. Farmers have to have them, and are going to get them from somewhere, and if we have not got them to sell, well then someone else is going to bring them in.

Last year we find that there were more pure-bred horses imported into Canada than ever before, of which the Clydesdales were by far the largest number. While a few were brought to the Maritime Provinces, the majority of them went to other parts of Canada, and the greater part to the West. Surely it would seem that out there they realize that it is the heavy horse the farmer needs. Farmers out there are willing to pay for the heavy horse and the importers would not bring them out if it were not for the demand. In Scotland, the home of the Clydesdale, the breeders have never had such a year owing to the demand for this horse. Recently at public auctions there was sold the pure-bred Clydesdale Stallion, Baron O'Buchlyvie lor the immense sum of $47,500, and when breeders will pay this much for a horse, it would seem to indicate that they do not anticipate a slackening in the demand for the heavy horse.

As I have said before we do not begin to fill our own markets with draught horses, and with the whole of Canada wanting horses, I do not see why New Brunswick should not be as well known as a country producing heavy horses, as other countries are. Take right at home here, there is the little Province of Prince Edward Island. There they have been noted for many years for the horses which they raise. A buyer going there would find no trouble in picking up a carload of the horses he wanted, in one district, but I will venture to say he would have quite a hunt in our Province to get a carload together. It is this demand that the farmers should get in line to supply. If a certain district would stick to the same breed for several years, keeping the best mares, gradually that section will become known as a centre where the buyer can come to, and find no trouble to get what he wants, be it an individual, or a carload. It does not take long to build up a reputation for good horses. Scotland is noted for its Clydes; Kentucky for its Thoroughbreds, and so on. P. E. I. has been the goal where horsemen would go to make their purchases. Yet I would venture to say that we have as good if not better foundation stock in the Province to-day than P. E. I. ever had. If our farmers would only breed along a definite line always breeding to the best stallion of the breed they consider is best suited, and sticking to that breed, there is no doubt that New Brunswick in the course of a very few years would produce draught horses as good as the best.

One trouble with the horse raising proposition is that the farmer when he has a good big brood mare is often induced to part with her, simply for the reason that the buyer sees in her what he wants and is willing to pay a big price for her. No doubt it is a good thing for the farmer at the time financially, that he has this type to sell. But it is just this selling of the best mares, why our stock of horses in the province is not better. As a consequence of this many of the best mares are taken very often to work in the woods, or the cities where their usefulness as breeders is at an end. Consequently the poorer mares are left on the farm, and it is these left-overs that the farmer has to use to replenish his stock. There is no doubt in my mind, that this is partly the reason of so many farmers preferring the smaller, or scrub sire, than the draught sire to mate with these mares. No doubt there is the fact to be considered that there is a certain amount of risk in breeding small mares to large horses, but if the farmers made it the practice to hang on to his larger mares very soon a larger stock of farm horses would be found through the country, and he would not have to patronize

the small grade sire, for the reasons above mentioned. Remember I am not trying to run down the lighter breeds of horses. We must have them. But so often the pure-bred stallion of the lighter breed is not to be found in the district where the farmer lives, that he is either obliged to ship his mare some distance at considerable expense, or patronize the grade sire, and where it is a colt the farmer wants, regardless of quality, it's the scrub that will be patronized every time. The farmer keeping 2 or 3 large mares, as the case may be, will find they will do his farm work besides raising a good colt. It's the large horse the farmer must have to do the heavy farm work. With regard to the lighter horse, from the figures I read you, you will see it's the big horse that the market pays best for, the heavier, the better, and it is the big horse that is best suited to farm work. Therefore if we are looking to the economical running of our farms, besides the extra price gained when we want to sell this class, we must breed the big horses, to get the top market figures. The smaller ones do not bring anything like as big a price but cost just as much to raise, therefore it is not the medium size or general purpose horse that we should raise but the draughter.

As I have mentioned before there is a great lack of good brood mares through the country. There are lots of small ones, i.e. mares from 10 to 1200. Breeding up a line of heavy horses from these mares is of course practicable, but it is here where the pure-bred comes in. During the past few years a number of good draught horses, Clydesdales in particular, have been brought into the Province. This has, no doubt, been a splendid thing for farmers who were able to avail themselves of the opportunity to get this class of stock. Indeed indirectly to the farmers as a whole, for very soon the progeny of these mares will be at a breeding age, and they will, no doubt, have a vast influence upon the character of the draught horses of the future in this Province. Pure-breds of course, imported into this Province have been brought primarily for the improvement of the breeding stock, but it won't be very long, if we keep them pure, that we will be in a position to cater to the outside demand. The man buying pure-bred stock is looking for the animal to build up the quality of the horses he is producing, and therefore, the extra price paid the breeder of pure-bred stock, is considerably more than he would get for an ordinary animal of mixed breeding, hence the advantage of having pure-bred. Pure-bred horses have the advantage over horses of mixed breeding in that they have been bred along the same lines for generations thereby fixing the type of the breed indelibly in the individual animal.

But we all have not got a pure-bred mare for foundation to start on. That may be, but there are throughout the province quite a good many good mares, and it is to these mares that we must look to build up a better class of heavy horses. In almost all sections of the province we will find the pure-bred draught sire both Clydesdale and Percheron, with the Clydesdale predominating. As a rule, these horses are good ones, and some extra good ones may be found in some sections. In Queens County last year we had three pure-bred Clydesdales, and one Percheron travelling, all good ones, showing the desirable characteristics of the breeds they represent. We have had Clydesdales travelling for several years, and when they have been judiciously mated to good mares, the results have been surprising, showing what may be done in building up the heavy horses of the province by the use of the pure-bred sire. Some men have colts from the second cross, the original mares having practically no pure blood in them, and these colts can convince the most sceptical, what a potent factor the pure-bred stallion is. Colts from a very ordinary mare weighing say 1300, and a pure-bred stallion weighing say 1600, should be larger than the dam, from the fact that the horse has size stamped on him, along with the other breed characteristics of past generations. This offspring if bred again to a pure-bred of the same breed as before, would produce colts which on maturity, with good care and attention should be as large, and have the leading characters of the breed the sire represents. After all it's sticking to one breed that counts in the long run. Keep right along on the same line and we are bound to get results. A dairyman trying to improve the milking qualities of his herd would not use a beef bull one year, and a dairy bull the next and so on. But it is just this that we are doing with our horse raising problem. One year we will breed to a Clydesdale, and perhaps breed the offspring to a scrub, or thoroughbred or standard-bred. Not that they have not got their places, but what I want to bring out, is that if we are to get larger horses, the horses that there is the most money in, we simply must follow along a definite line of breeding if we wish to get anywhere' and with the pure-bred draught sire in almost every section, why in the world don't we stick to one breed, rather than the hap hazard way we have done in the past, patronizing any kind of a stallion, regardless of breed and quality. Finally if we are going to breed horses at all, breed from strongly constituted animals of desired conformation, perfectly sound and not related, and by keeping animals in perfect condition, by good housing, feeding a balanced ration at the proper time, abundance of pure water and frequent exercise. No matter how good the parent stock is if the care in bringing up the animal is neglected, why then we need never try and raise horses.

I think probably the greatest curse to the horse raising industry, not here alone, but all over, is the scrub sire. I know down in our county you may look around almost anywhere and you can see the results of the mongrel sire. Indeed it is the same all over the province more or less. And yet some farmers will patronize the scrub sire simply for the reason that the service fee is small, but do they realize that the extra money invested for the service of a pure-bred sire would, when the time comes for him to dispose of the offspring, pay him many times over for the extra amount charged for the service fee. As I have said I have seen colts from ordinary mares and pure-bred sires turn out to be surprisingly good horses, and again colts from ordinary mares and scrub sires turn out to be anything but good. They are not draught horses in any sense of the word, they are not carriage horses, and are not general purpose horses. The sooner we can rid our country of this type of horse the sooner will the horse breeding in the province get on a better footing.

What encouragement is there for a man to invest in an expensive pure-bred sire and travel him for service through a district when he is up against the competition of a grade sire? The owner of the pure-bred, by reason of the capital involved in the purchase of the animal has to have a service fee that will pay him for his investment. Comparing the service fees here and in Scotland, they are remarkably low here. There it is a very ordinary horse that does not get $25, and some of the best bred horses go much higher, and I believe the service fee of Baron's Pride is £100 i.e. $500.

Looking Across the St. John River From Hartland, N.B.

What inducement is there for an individual or company to purchase an expensive horse, and then have him get perhaps one-half the number of mares he would get if it were not for the competition of the scrub sire? It's only the service fee that counts with some men regardless of progeny produced, so it is with these men falls the responsibility of the condition of horse raising as it is found in certain parts of the province today. The owner of the pure-bred is not in the business for his health, and in time, unless the scrub sire is curtailed, the pure-bred will be confined mostly to the man who has a large number of mares and the condition of horse raising will be worse off than ever. It is all very well for the Government to bring pure-bred mares and stallions into the province. No doubt it is a splendid thing to get the horse breeding interests on a firm footing, but I say here that the results cannot be lasting if the progeny of this pure-bred stock is to be polluted by the scrub sire.

All over the country there is the cry from progressive horse breeders to take means to get rid of the grade sire or greatly curtail his power. Legislation has been adopted in many countries, a great many states of the union and some of the Provinces of Canada. Notably Manitoba, Saskatchewan and Alberta. With Manitoba falls the honor to be the first Province to Legislate against the grade sire, the law was not very stringent only requiring that the stallion be enrolled whether scrub or pure-bred. I believe another law will come into force in 1914 which will do away with the scrub stallion altogether.

In Ontario in 1908 the Stallion Legislation Bill was brought before the Legislature. It covered the ground thoroughly, but for some reason was thrown out. So far they have no Legislation on the subject, but we find that at the annual meeting of the Clydesdale Horse Society held recently at Toronto that this matter was thoroughly discussed, and a strong resolution was passed condemning the action of the Government in not passing the bill which has the weight of all prominent horsemen in that province, and urging them to pass the bill as laid down in 1908. The Ontario Horse Breeders Association also took up the same matter at their recent meeting and will, no doubt, urge the Government to pass the bill. At the annual meeting of the Natural Live Stock Association held in Ottawa last month, this question was thoroughly discussed, and it was urged that the Provinces, not already having Laws on the subject, take means to get Legislation. Furthermore a strong resolution was drawn up to this effect. When we see an Association like the one last mentioned, comprised of experts in the live stock business all over Canada, being unanimous on this question, surely it is time that the breeders of New Brunswick got in line to ask for Legislation. I believe there was a resolution presented to the Local Legislature last session, but it was never acted on.

I think if the farmers and various Breed Associations would get together and urge on the Government the necessity of some sort of action on this matter of getting rid of the scrub stallion, that we could work to some avail, but it is not from one or two that we can expect to get results. We must pull together. I would advise our discussing the matter and get the general opinion of the breeders throughout the province, and then we will be in a position to go ahead with this important work.

No doubt you have all read Prof. Cumming's excellent article in the Maritime Farmer of recent date on the subject of Horse Legislation. I think if Nova Scotia is thinking about the matter, that it is high time for us to be up and "doing" for we don't want Nova Scotia to beat us out in this work.

Now Gentlemen, this province is awakening to its possibilities. Never before has New Brunswick been in the public eye as it is to-day, both industrially and agriculturally. Fruit growing has received a tremendous impetus during the last 2 or 3 years. Immigration is being turned this way, and everywhere the province is developing. New Railways are opening up portions of the country that have long been without proper transportation facilities. Surely then now is the time to awaken to the possibilities of horse raising in this province of ours, so that with the high tide of prosperity sweeping through the country, the horse raising industry may be at the very crest of the wane.

Home Mixing and Application of Fertilizers.

Apply the Ingredients Required by Your Soil.

By Walter Shipley, Toronto.

As farmers become more and more interested in the use of commercial fertilizers, they realise they must gain more knowledge of their soil and crop requirements and also of the composition and uses of the fertilizers they are using, in order to be able to apply them economically and judiciously. In the past they have bought various mixtures, prepared to meet the demand of different crops and have applied these with varying results. The manufacturers of these mixed fertilizers seem to have overlooked the fact that any particular crop grown under different climatic conditions, on different soils or even under various systems of cultivation, requires varying proportions of the three "plant food" ingredients in Nitrogen, Phosphoric Acids and Potash. However, it is not the intention in this article to discuss the merits or demerits of the various brands of mixed fertilizers but rather to give an outline of the method of mixing and applying fertilizers on the farm and the advantages gained by doing so. We venture the assertion that the farmer can, with an ordinary knowledge of this subject, compound mixtures at home that will give just as good results as the use of "mixed goods" at a much less cost. It has been argued in the past that farmers did not understand enough about the use of fertilizers to even attempt to make their own mixtures. Now that this argument no longer holds good, it is contended that the farmer, not having the necessary machinery, etc., is not able to mix the fertilizers thoroughly enough. As the fallacy of this argument has been repeatedly proved in various parts of the Dominion, it is unnecessary to enlarge further on it here. We have never yet known a farmer who was unable to make a satisfactory mixture, provided an ordinary amount of care was exercised

ADVANTAGES OF "HOME MIXING."

The advantages of home mixing are so ably and concisely summed up in a bulletin "Artificial Fertilizers; their nature and use" by B. Leslie Emslie, that we quote them here just as given:

"1—ECONOMY: Usually at least 25 per cent is saved in purchasing the separate ingredients. There is no useless "filler" to add to the freight charges; there is no duty on the separate ingredients, whereas the farmer must bear the cost of the duty imposed on the ready mixed goods, where these are imported from the United States.

2—ASSURANCE: The farmer who purchases the separate ingredients, especially if he insists on getting them in the original sacks, knows exactly what he is getting for his money; whereas the purchase of a ready mixed brand is more often like buying a "pig in a sack."

3—ADAPTION: With a stock of the separate ingredients on hand, a farmer is enabled to make up his mixtures according to prescriptions he has prepared to suit the varying requirements of the different crops and soils."

It might not be out of place here to point out that the analysis of a fertilizer is not the only factor to be considered either when buying ready mixed brand or when making up a mixture at home. The quality of the materials used to supply the plant food in a fertilizer will very often constitute the difference between a good and a poor fertilizer.

MATERIALS USED IN HOME MIXING.

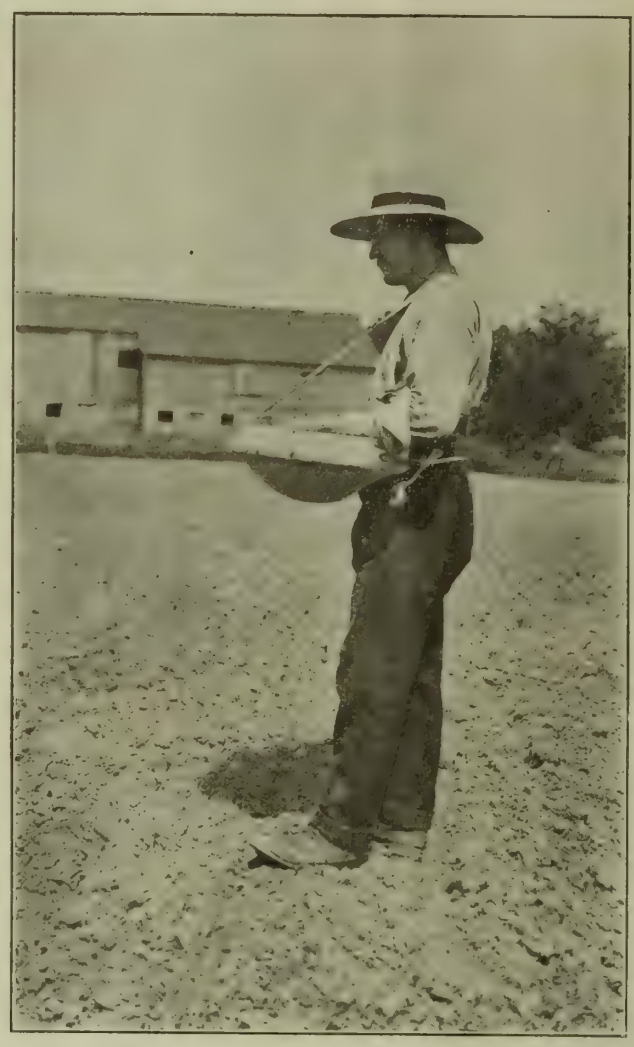
The following are the most commonly used and probably the most suitable materials for use on the farm:—

NITROGEN

Nitrate of Soda.....16 p.c. available
Sulphate of Ammonia
....20 p.c. available
Lime Nitrogen or Cyanamid
....18 p.c. available

PHOSPHORIC ACID.

Acid Phosphate.....15 p.c. available
Basic Slag..... .....18 p.c. available
Bone Meal..... .....22 p.c. available



Sowing Fertilizer by Hand.

POTASH

Muriate of Potash.....50 p.c. available
Sulphate of Potash....50 p.c. available

The choice of materials is very largely determined by their relative prices. The crop to which they are to be applied is also a determining factor. For instance, on the Potato crop the Sulphate of Potash is invariably used in preference to the Muriate as the latter is said by many authorities to have a detrimental effect on the quality of the tubers. The soil has also to be considered. On a sour or acid soil it is usual to use Basic Slag in preference to Acid Phosphate as the free lime in the former tends to counteract the acidity. Also on a dry soil Nitrate of Soda would probably give better results than Sulphate of Ammonia as the former absorbs and retains moisture, besides being more readily available.

METHOD OF MIXING.

Let us now consider the actual operation of mixing fertilizers on the farm and we will find that it is not nearly as difficult and intricate a process as many would have us believe for various reasons. The only real difficulty we have ever encountered, while superintending the mixture of fertilizers in various parts of the Dominion, was to obtain a suitable floor. Where a concrete floor is available it is, of course, preferable, otherwise it will be necessary to choose a level, firm part of the barn floor. Having overcome this difficulty the only other requisites are:—a broom, a shovel, a large hammer or post (for breaking down the lumps), a sieve and a set of weigh scales. While the scales are not absolutely necessary it is generally advisable to check the weights of the sacks. It is not satisfactory to mix too large a quantity at one time, a ton being perhaps the best quantity to handle. Having swept a suitable place quite clean, spread half of the phosphatic part of the fertilizer on the floor and on it empty half of the Potash. If Cyanamid is used to supply the necessary Nitrogen, half of this can be spread over the other two. Next put on the balance of the Phosphate, Potash and Cyanamid in the order named. Where Nitrate of Soda or Sulphate of Ammonia are used it will be necessary to spread them on the floor by themselves and pulverize the lumps with the post or hammer, before spreading on the other mixture. The whole mixture should then be turned from one side to the other three or four times, in a manner similar to mixing sand and cement. Where a sieve is procurable, we have found it of great benefit, after turning two or three times, to put the mixture through the sieve. This serves the double purpose of making the mixing more thorough and retaining any lumps, which can then be broken and added to the heap. Many farmers give the heap another turning after being put through the sieve. The mixture can then be bagged and put away in a dry place ready for use.

Each batch should be treated in this way.

A PRECAUTION.

When compounding a mixture it is necessary to remember that certain of the ingredients can not be mixed together. Sulphate of Ammonia must never be mixed with Basic Slag or Quick Lime; as free lime in these ingredients will combine with the Sulphate part of the former, setting free the valuable Ammonia. A mixture of Acid Phosphate and Nitrate of Soda, also, should not be allowed to stand for any great length of time as the bags will be rotted away.

All of the other ingredients can be mixed together with safety.

TIME TO APPLY FERTILIZERS.

Where possible it is always advisable to apply fertilizers from ten to fourteen days before putting in the crop. Particularly is this the case where the rainfall is light.

The exact time of application will, of course, be largely determined by the crop and rate of availability of the fertilizer materials used. In the case of hay and grain crops, where for any reason it is not possible to apply the fertilizers very early, they can be applied with the crop, as the growing season is fairly long. For fruit trees it is usually advantageous to apply in late fall or as early as possible in spring, as development takes place as soon as the frost leaves the ground. While we know that it is not customary to apply the fertilizers to any of the root crops previous to seeding, we are convinced that better and more certain results would be obtained were they applied, as has been already stated, about ten days before the crop is put in.

THE MATERIALS USED to supply the various ingredients above determines in some measure the time of application.

THE POTASH SALTS may be applied at any time, but as they do not leach out of the soil, they can safely be applied in the fall.

BONE MEAL AND BASIC SLAG, being rather slow in their action, usually give more certain results when applied either in fall or early spring.

ACID PHOSPHATE is more readily available but is suitable for either fall or spring application. Where late spring application is necessary this is the most suitable source of phosphoric acid to use.

TANKAGE, DRIED BLOOD AND CYANAMID, on account of their somewhat slower rate of availability, should be applied early in spring. Nitrate of Soda on the other hand, is extremely soluble and seems to give the best results when applied just before it is needed by the crop.

SULPHATE OF AMMONIA is between Nitrate of Soda and these other materials in rate of availability and is perhaps more suitable than Nitrate of Soda in moist climates.

CYANAMID is rapidly gaining favor on account of its drying properties, making a mixture very dry and friable and easily sown with any of the fertilizer sowers.

METHODS OF APPLICATION.

Fertilizer can be applied either by hand or by a fertilizer distributor. As most of the grain drills, potato planters, etc., now have fertilizer attachments, very little is sown by hand. Where it is necessary to apply by hand, the best sowing arrangement we know of is an oval shaped frame of iron loosely covered with canvas making a kind of bag and with shoulder and waist straps for supporting it. The process of sowing is in every respect similar to the sowing of grain. In order to save as much time as possible when sowing, the bags should be placed at convenient distances through the field. It also saves considerable time to have a boy to carry the fertilizer from the sacks to the sower.

Application by machine is, however, always preferable as it not only saves time but also ensures a more even distribution.

There are several fertilizer sowers on the market, varying considerably in price and effectiveness. The machine shown in the illustration on page 457 is being used with very satisfactory results by an increasing number of Canadian farmers. Very satisfactory results are obtained by

(Continued on page 530).

The Cost of Producing Grain Crops.

Factors Affecting Yield.

"As a Man Soweth So Shall He Reap."

THE average cost of producing a grain crop, as shown by statistics carefully gathered for six years on twenty-five Minnesota farms, is, including land rent, $8.10 per acre. Of this cost 93 cents was for seed and $1.36 for plowing and preparing the seed bed. These two items, seed and soil preparation, are the two operations which have most to do with the yields. Either poor seed or poor soil preparation may result in crop failure, or a very poor crop, while good seed and good soil preparation make possible the very best kind of a crop. The total cost of these two items is but little more than one-fourth of the total cost of the crop, yet in these two operations man's greatest influence, and practically his only influence, is exerted.

These two operations are charged with great potentialities in regulating the prospective crop, and on this account are worthy of the most careful study.

WHAT IS GOOD SEED? ...

The subject of this paper, "Good Seed," is one of especial timeliness between now and seeding time. The term "good seed" may convey different ideas to different people. To the practical farmer, however, good seed means clean, pure, strong seed capable of germinating and producing a maximum crop of good quality. Plant breeders and seedsmen have done much to develop strains or varieties of seeds, of good quality and large productive power; and these seeds have done much to improve the yield and quality of the common field crops.

Experiments in getting seed from one locality, to sow in another locality, have almost without exception proved unsatisfactory. They have usually resulted in lower yields or poorer quality. This seems to be due to the fact that plants, like animals, become adapted to the conditions under which they are grown and that, other things being equal, they do better after they have become acclimated than when first introduced.

The law of the "survival of the fittest" is well known to all, and it is but natural to expect that when a great many individual kernels of grain are sown in a field some of them will prove better adapted to the peculiar conditions of soil and climate than will others. This being true, the kernels adapted to the local conditions will have a more perfect growth and will mature better seed than the other kernels. It is likewise reasonable to expect that if kernels are selected and planted each year from plants that have shown their adaptability to local conditions by producing perfect plants and seeds some improvement will result.

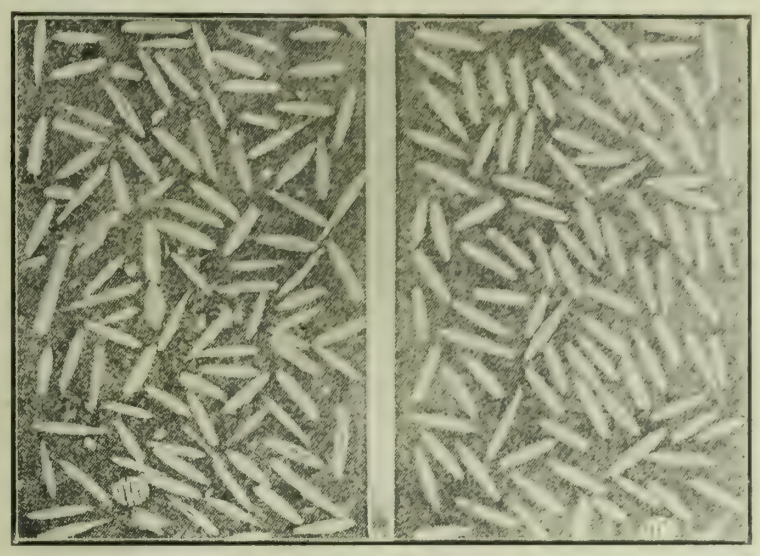
PLANT BREEDING.

The above is exactly what the plant breeder does. He plants a large number of kernels of some variety of grain that he is trying to improve, in soil as nearly uniform as he can make it, then at harvest time he selects such plants as have actually been able to produce the largest yields of the best quality, and in this way he is able to breed varieties of high yield and of good quality.

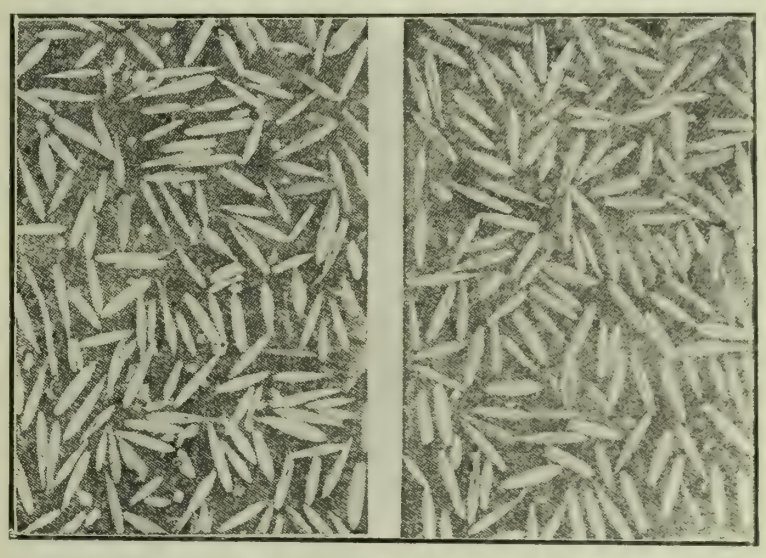
What the plant breeder does by his careful, painstaking study of individual plants the farmer may do, to a limited extent, by carefully selecting the best kernels of seed from any crop produced on his farm.

INDIVIDUALITY OF KERNELS OF GRAIN.

A few moments' study of a handful of grain, spread on a sheet of white paper, will convince the most skeptical that there is quite as much variation in the individual kernels composing the handful as in the individual animals in a bunch of cattle or hogs. We have become accustomed to selecting the best animals produced on the farm and keeping them for breeding purposes, while very little attention has been given to selecting the best kernels of grain grown for seed. This is but natural, since the animals are large and noticeable, while kernels of cereal crops are small and are seldom considered as having any individuality, but rather as the insignificant units which make up bushels or bins of grain.



On the Left, a Sample of Original Oats, Weighing Thirty Pounds Per Bushel. On the Right, a Sample of the Five and One-Half Pounds, Weighing Thirty-Eight Pounds Per Bushel, Graded from the Above Fifty Pounds of Oats Weighing Thirty Pounds Per Bushel.



On the Left, Sample of the Market Oats, Weighing Thirty-Four Pounds Per Bushel On the Right, Sample of Tail Oats, Weighing Twenty-Seven Pounds Per Bushel, That Can Be Used for Feed.

RESULTS FROM SELECTING SEED GRAIN.

Extensive experiments have been made by experiment stations to determine the relative yielding power of heavy and lightweight kernels of grain, and the universal result has been a decided increase in yield where the heavy, plump seed is sown. A cow in good condition will give birth to a stronger calf, and will give more milk to nourish it, than will a cow in a poor and weak condition. Correspondingly a plump, heavy kernel of grain will produce a stronger plant and nourish it better than will a shrunken, light kernel. The following results attest the above fact: At one of the U. S. experiment stations some winter wheat was graded and the heavy and light seed sown separately on adjoining plots. The average yield in two years were 29.4 bushels per acre from heavy seed and 24.8 bushels per acre from the light seed; a gain of 4.6 bushels in favor of the heavy seed. A similar experiment with heavy and lightweight oats of the same variety gave an increase of nine and one-half bushels per acre in favor of the heavy seed. Similar experiments conducted for a long series of years at the Ontario Experiment station at Guelph show very marked increases in yield from heavyweight seed of oats, barley and wheat.

CLEANING AND GRADING GRAIN.

It is manifestly impracticable to select, on the farm, either individual plants or individual kernels of grain, unless some rapid, easy way is provided to do it by machinery. The modern fanning mill, if properly operated at the right time, will make a very satisfactory selection of grain. The practice of waiting until near seeding time to clean and grade grain is not usually advisable, because it generally results in so reducing the stock of grain that there is but little to select from. On the other hand, if the selecting of seed grain is done earlier in the season, or while there is still plenty of grain available, a much more thorough selection is possible.

SELECT ONLY SMALL PER CENT. FOR SEED.

If a grower producing 1,000 bushels of grain needs 100 bushels for seed and can select the best 100 bushels out of the 1,000 bushels, it is evident that he will get pretty choice seed. By using a side-shake mill, 100 bushels of the heaviest and plumpest seed may be selected from either 200 bushels or 1,000 bushels and good seed secured, and secured at a cost so low as to make the use of poor seed seem ridiculous. But the advantage in quality will undoubtedly be with the lot selected from the 1,000 bushels. With a good mill two men can run through by this process at least 300 bushels of grain per day. If 10 per cent. of the best of this is graded out for seed thirty bushels of seed will be secured for the day's work. If their time is worth $1.50 per day each, the thirty bushels will cost for additional labor in cleaning and grading 10 cents per bushel. Few people familiar with crop-growing will claim that this additional charge of 10 cents per bushel, or from 12 to 20 cents per acre, for this better seed is not a very good investment.

THE PROCESS.

There are two principles by which a modern fanning mill can separate grain, namely, by size of kernel and by difference in weight. The mills best adapted to do the work of grading seed grain use both principles. The grain is conveyed from the hopper by a board in the throat of the machine back to a place where it drops through the wind blast to the screens below. As the grain falls through the strong wind blast the heavier kernels fall more nearly straight down than do the lighter ones. The upper screen is adjustable, and can be moved forward or backward to catch a small or a large per cent. of the falling grain, as desired. This makes the separation, the heavier grain falling on the upper screen, while the balance is blown just over the end of this screen and falls on the lower screen, where, together with the small, heavy kernels that will pass through the upper screen, it is conveyed to the feed or market grain pile, while the heavy, plump kernels are conveyed to the front of the machine for seed. There is absolutely nothing wasted by the process. The chaff and screenings are as valuable as when mixed with the grain. The seed includes the best seeds from the whole body of grain; the balance is as good for market or feed as before.

As illustrated in one of the cuts herewith, fifty pounds of grain were run through the mill, five and one-half pounds taken out for seed, 2.2 pounds of screenings and chaff removed and the balance left in good condition for feed or for market. The original sample weighed thirty pounds per bushel, the selected seed thirty-eight pounds and the market grain thirty-four pounds.

By selecting a small per cent. of the grain grown, seed adapted to the local conditions—also seed capable of producing and feeding strong plants—is secured and all ordinary weed seeds and dirt removed. There is no better or safer way of securing good seed for the great bulk of the crops grown on the farm than by selecting it from the grain grown thereon.

If you are not entirely convinced of the advantages of properly selected seed grain, select at least enough for one of your fields and we have no hesitation in predicting that your scepticism will disappear when you harvest your grain next Autumn.

Demonstration Orchard Work in New Brunswick.

"Long is the Way by Rule, Short and Easy by Example."

By A. G. Turney.

BELIEVING that many of our farmers would give more care and better attention to their orchards were they more convinced that by doing so they would yield their most profitable crop, it was decided to take hold last spring of the orchard of Mr. Joseph Hawkins, Sugar Island, York County, and a portion of the orchards of Mr. J. W. Clark, Maugerville, Sunbury County, and of Mr. H. L. Steeves, Lower Coverdale, Albert County, with the aim of giving as complete a demonstration as possible of the successful renovation and management of bearing orchards.

GENERAL TREATMENT.

The orchards were pruned, the rough bark scraped off the trees and wounds resulting from sunscald, canker, etc., carefully cut back and painted. A dormant spray, consisting of commercial lime-sulphur, diluted with water one to nine for the purpose of destroying the oyster shell scale and removing lichens and other fungous growths, was applied, and followed by two summer sprays for the control of the apple scab, codling moth worm, and leaf eating insects, as follows:

1st—Just as leaf buds were swelling.

2nd—Just after blossom fall.

In the orchards in Albert and York, a medium application of barnyard manure was ploughed under and applications of commercial fertilizers were scattered broadcast and harrowed in. The orchard at Maugerville being on intervale land, was not ploughed, but top dressings of fertilizers were experimented with. In the other orchards clean cultivation was kept up until about June 25th, when the land was seeded down to cover-crops, such as summer and winter vetches, mammoth red and crimson clovers.

SPRAYING MATERIALS USED AND THEIR COST.

Commercial lime-sulphur and lead arsenate were the materials for the dormant spraying. Lime-sulphur, without any poison, at the rate of four gallons to thirty-six gallons of water, was used. Cost of lime-sulphur landed at the orchard was $9.00 per forty gallon cask or 22½c. per gallon. Four gallons of lime-sulphur for every barrel of dormant spray gives us a cost per barrel of 90c. For the subsequent sprays, when the leaf buds were bursting and after blossom fall, one gallon of lime-sulphur 22½c., 38 gallons of water, and two pounds of lead arsenate at 12½c. per pound, 25c. were used. Therefore, cost per barrel for summer spray equals 47½c. We found by experience that on the average it took two men and a team eighty-five minutes to prepare and apply a barrel of spray mixture. Estimating the pay of a man at 15c. per hour, and the hire of a team at 20c. per hour, we have the cost of preparing and applying a barrel of spray at 75c. This gives a total cost, for the spraying materials purchased, prepared and applied to the trees, of $1.65 per barrel of the dormant spray, and of $1.22½ per barrel of the summer spray.

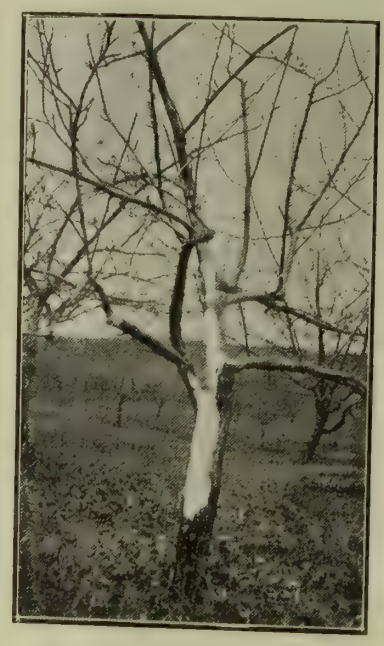
The outfit used in applying the spray consisted of a No. 2 brass lined "Perfect Spray Pump" of forty gallons capacity, with two twenty-foot lines of hose, two double nozzles, and all attachments. These outfits were purchased from the manufacturer, R. B. Westhaver, Mahone Bay, N. S. In all the sprayings only one line of hose was used.

THE SUNBURY COUNTY ORCHARD

This orchard is situated on the eastern bank of the St. John River at Maugerville, on high intervale land. The soil is a dark loam several feet deep and is exceedingly fertile, being part of the old river bed. The orchard is in sod and never cultivated, the ground being moist and rich enough to produce good hay crops and at the same time to keep the trees, eighteen years old 20 x 20, nearly all of the Wealthy and Duchess variety. The Duchess trees have far outgrown the Wealthy, and have twice the bearing surface of the latter.

One block of sixty Duchess and another block of 100 Wealthy, covering in all about one and two-thirds acres, were taken under control by the Department, pruning operations commencing on March 31st. Two double-horse loads of barnyard manure were applied as a top dressing to a block of twenty Wealthy trees, and 180 lbs. of superphosphate to a similar sized block of the same variety.

Before Treating.



After Treating.

Bad Sunscald and Canker Wound Before and After Treating.

EXPENDITURE.

Spring Operations:	
6 days' pruning at $2.00	$12.00
2 days' scraping and painting trees	3.00
1 gallon paint	2.25
2 days' hauling brush	7.00
2 loads of manure applied	3.00
180 lbs. superphosphate applied	3.50
10 bbls. dormant spray at $1.65 applied	16.50
4 bbls. summer spray on Wealthy trees applied, at $1.22½	4.90
8 bbls. summer spray on Wealthy and Duchess applied	9.80
Depreciation in spraying outfit	5.00
	$63.95
Harvesting:	
Wealthy—112 bbls. at 25c.	$28.00
Pickling and packing at 18c. per bbl.	20.16
Hauling to wharf at 2c. per bbl.	2.24
Duchess—100 bbls. at 25c. per bbl.	25.00
Pickling and packing at 18c. per bbl.	18.00
Hauling to wharf at 2c. per bbl.	2.00
Interest at 6 p..c. on $660, value placed on the 1 2-3 acres of orchard by Mr. Clark	40.00
Total expenditure	$194.35

REVENUE.

84 bbls. Wealthy No. 1, at $1.50 per bbl., f.o.b.	$126.00
28 bbls. Wealthy No. 2, at $1.00 per bbl., f.o.b.	28.00
67 bbls. Duchess No. 1, at $1.50 per bbl., f.o.b.	100.00
33 bbls. Duchess No. 2, at $1.00 per bbl., f.o.b.	33.00
Total Revenue	$237.50
Expenditure	191.35
Net profit on 1 2-3 acres	93.15

Net profit per acre, $55.89, which on a valuation of $400.00 is a return of almost 14 per cent.

While the Wealthy trees received the three full sprayings, the Duchess trees received only the first and third sprayings, the second one being omitted. Mr. Clark considers the crop from the Wealthy trees as a fair average one, but states that it was an off year for the Duchess, and he expects to receive over twice the crop in 1913 from the same block of sixty Duchess. In giving the revenue, no mention has been made of the hay harvested from between the trees—which yielded about $12 clear of harvesting expense. Mr. Clark states that the Wealthy apples packed a larger percentage of No. 1's than usual, due to the pruning and spraying. On the other hand, the Duchess, while being practically free from codling moth injury and fungous diseases, produced many knotted and deformed apples, due to imperfect fertilization of the blossoms, hence the larger percentage of No. 2's.

THE YORK COUNTY ORCHARD.

This orchard is situated at Douglas, on a strong southern exposure to the St. John River, and contains about 130 trees of various ages and sizes, planted different distances apart, most of them about fifteen-by-twenty feet. This orchard had not been ploughed for fifteen years, and when taken hold of there was much dead wood in the young growth and almost every tree had developed large trunk wounds from sun-scalds, and were more or less affected with black rot canker. The soil is a medium red loam with gravelly sub-soil. The varieties were as follows: Duchess, Alexander, Wolfe River, Fameuse, Wealthy, McIntosh Red, Montreal Peach, Switzer, Bishop Pippin, Bethel, Eccles Pippin and Gano. The owner placed a valuation last spring on this orchard of $150 per acre.

Pruning operations were commenced on April 27th. In all twelve sloven loads of brush were removed after pruning. On May 3rd and 4th the lime and sulphur not having arrived, the trees were sprayed in their dormant state with fresh lime, slacked, 30 lbs.; water, 40 gallons, and lye, 1 lb., the canker and sun-scald wounds being heavily sprayed with this solution. Eight barrels were sufficient to completely cover every twig in the orchard. On April 27th, fifteen double horse loads of well rotted barnyard manure were applied as a top dressing. The second spraying of commercial lime-sulphur. summer strength, 1 gallom to 38 gallons, of water, and 2 lbs. of lead arsenate, was applied on May 10th and 11th, at which time the leaf buds were opening. The third spraying of the same strength was applied on May 30th and June 1st, just after blossom fall. The top dressing of barnyard manure was turned under on May 15th and 16th, ploughing both ways with one horse, and having a man to hold up low and inter-crossing branches. 430 lbs. nitrate of soda, 1,000 lbs. basic slag and 900 lbs. sulphate of potash, were applied and harrowed in during the last week of May. Crimson and mammoth red clover and summer and hairy vetches were sown as cover crops about the 25th of June. In August a portion of the orchard became rather badly infested with apple aphis and four barrels of kerosene emulsion were applied.

EXPENDITURE—SPRING OPERATIONS.

6 days' pruning at $2.00	$12.00
2 days' cutting out sunscald wounds	3.00
1 day scraping	1.50
2 days' painting	3.00
2 gallons paint	4.50
1½ days' hauling brush—2 men and team	7.50
15 two-horse loads of manure applied, $22.50—one-half chargeable to 1913	11.25
2 days' ploughing, 2 men and 1 horse	9.00
1 day harrowing—one horse	3.00
1,000 lbs. basic slag, 900 lbs. sulphate of potash, and 430 lbs. nitrate of soda, $46.98—one-half chargeable to 1913	23.49
Applying the same	1.75
Freight and hauling to orchard on same, one-half chargeable to 1913, $3.00	1.50
Cover crop seeds	3.75
Sowing the same	.75
250 lbs. fresh lime, $1.50; 8 lbs. lye, 80c. (8 bbls. lime and lye wash)	2.30
To applying the same	6.00
10 bbls. summer spray applied at $1.22½	12.25
8 bbls. summer spray applied at $1.22½	9.80
4 bbls. kerosene emulsion	1.10
Applying same	3.00
Depreciation of spraying outfit	5.00
	$119.44

HARVESTING EXPENDITURE.

147 bbls., delivered, at 30c	$44.10
Picking and packing, at 20c	29.40
Hauling to market, 15c	11.76
	$85.26
6 per cent. interest on $225, the value placed on the 1½ acres of orchard by Mr. Hawkins	13.50
Total expenditure	$218.20

REVENUE.

32 bbls. Wealthy No. 1, at $2.00	$64.00
17 bbls. No. 1, Switzer, at $3.00	51.00
14 bbls. No. 1 McIntosh, at $4.50	63.00
12 bbls. No. 1 Fameuse, at $3.00	36.00
12 bbls. No. 1 Alexander, at $2.00	24.00
5 bbls. No. 1. Bethel, at $3.50	17.50
4 bbls. No. 1 Duchess, at $1.50	6.00
3 bbls. No. 1 Switzer, at $4.00	12.00
3 bbls. No. 1 B. Pippin, at $3.00	9.00
3 bbls. No. 1 Milding, at $2.50	7.50
3 bbls. No. 1 Gideon, at $1.50	4.50
2 bbls. No. 1 Peewaukee, at $2.50	5.00
1 bbl. No. 1 Wolfe River	2.50
1 bbl. No. 1 Gano	2.50
1 bbl. No. 1 Montreal Peach	1.50
113 bbls. No. 1 apples	$306.00
12 bbls. No. 2 Wealthy, at $1.25	15.00
6 bbls. No. 2 Switzer, at $2.00	12.00
4 bbls. Na. 2 Fameuse, at $2.00	8.80
4 bbls. No. 2 Alexander, at $1.25	5.00
3 bbls. No. 2 Natives, at $1.00	3.00
1 bbl. No. 2 McIntosh	3.00
1 bbl. No. 2 Peewaukee	1.75
1 bbl. No. 2 Milding	1.50
1 bbl. No. 2 Duchess	1.00
1 bbl. No. 2 Gideon	1.00
34 bbls. No. 2 apples	$ 51.25
	306.00
Total revenue	$357.25
Total expenditure	218.20
Net profit on 1½ acres	$133.05

Net profit per acre, $88.56, which on the valuation of the owner of $150.00 per acre, is a return of 59 per cent.

It should be mentioned that not more than 90 of the trees bore fruit, and that of those only ten were large, about twenty of the medium size and the balance quite small. In addition to yielding well, the trees made from 10 to 15 inches of new growth, and the deep glossy green foliage indicated an almost complete restoration of vigor and vitality. All four cover crops grew luxuriantly and formed a dense covering, which will not only hold the snow well and afford good winter protection, but when turned under in the spring will greatly improve the mechanical condition and fertility of the soil. Owing to the rather broken-down condition of the orchard when taken hold of, the operating expense was much heavier than will be necessary for succeeding years, and more of it might reasonably be charged to the future.

On an orchard planted and raised to a bearing age with proper care, the annual cost per acre of the spring operations would not even at a high figure, exceed $35.00. In this case, owing to the poor condition of the orchard, the spring operations cost $83.62 per acre; though the yield was not heavy, the actual net profit per acre was $88.70. Add to this the $48.62 extra spring expense over normal conditions, and we have a net profit per acre of $137.32.

THE ALBERT COUNTY ORCHARD.

This orchard is situated at Lower Coverdale, on the Petitcodiac River, six miles below Moncton. The soil is a stony loam with a gravelly subsoil. The site has a northeastern exposure to the river and is well windbreaked with spruce. There are about 625 bearing trees about thirty-five years old, and 21 by 26 feet apart, mostly of the Winter Bough variety.

Eight rows were taken over by the Department of Agriculture last spring, in which were the following trees: 65 Winter Bough, 44 Alexander, 39 Bishop Pippin, 26 Red Streak, 17 Ribston Pippin, 7 Manx Codling, 5 Belliveau, 2 Northern Spy, 1 Greening, 1 Fameuse, 1 Gravenstein and nine others, various varieties, names not known. The Winter Bough, Red Streak and Manx Codling were about all large trees, but many of the Alexander were badly cut up and had had their bearing surface much reduced through black rot canker on the limbs. The other trees were of medium size. Pruning operations were commenced on March 24th. The many numerous large canker and other wounds made the scraping and painting work very heavy, and in reality half the expenses thus incurred should be charged to succeeding years.

Unpruned Duchess Trees.

Pruned Duchess Trees.

EXPENDITURE—SPRING OPERATIONS.

10 days' pruning, at $2.00	$20.00
7 days' painting, scraping and cutting out wounds, at $1.50	10.50
3 gallons of paint, at $2.50	7.50
10 bbls. winter spray applied, at $1.54	15.40
10 bbls. summer spray applied, at $1.12	11.20
12 bbls. summer spray applied, at $1.12	13.44
Freight on 50 lbs. lead arsenate	.50
Freibht on 2 bbls. lime-sulphur (extra)	.50
1½ days, 2 men and 1 horse, hauling brdsh	6.75
36 two-horse loads manure applied, one-half chargeable to 1913, $54.00	27.00
1,000 lbs. basic slag and 900 lbs. sulphate of potash, one-half chargeable to 1913, $38.45	17.73
Hauling fertilizer to orchard, half cost	1.50
Ploughing 1½ days, at $3.50	5.25
Harrowing, 3 times one day	3.50
Cover crop seeds	6.75
Sowing same	.75
Depreciation of Spraying Outfit	5.00
Total	$153.27

HARVESTING EXPENDITURE.

697 bbls. delivered, at 30c	$209.10
Picking and packing, at 25c	173.25
Hauling to station, at 8c	55.76
Freight on 181 bbls. to St. John	41.60
Interest at 6 p.c. on $1,500.00, value placed on 3 acres of orchard by Mr. Steeves	90.00
	$569.71
	153.27
Total expenditure	$722.98

REVENUE.

188 bbls. No. 1 Winter Bough, 35 bbls. No. 2 Winter Bough, at $1.60	$356.80
70 bbls. No. 1 Red Streak, 13 bbls. No. 2 Red Streak, at $1.60	132.80
24 bbls. No. 1 Manx Codling, 6 bbls. No. 2 Manx Codling, at $1.60	48.00
105 bbls. No. 1 Alexander, 35 bbls. No. 2 Alexander, at $1.60	224.00
23 bbls .No. 1 Ribston, at $2.50	57.50
14 bbls. No. 2 Ribston, at $2.00	28.00
71 bbls. No. 1 Bishop Pippin, at $2.75	195.25
59 bbls. No. 2 Bishop Pippin, at $2.25	132.75
22 bbls. No. 1 Various, at $1.50	33.00
8 bbls. No. 2 Various, at $1.25	10.00
10 bbls. No. 1 Belliveau, at $2.00	20.00
7 bbls. No. 2 Belliveau, at $1.50	10.50
1 bbl. No. 1 Northern Spy, at $4.00	4.00
3 bbls. No. 2 Northern Spy, at $2.50	7.50
2 bbls. No. 1 Fameuse, at $3.00	6.00
1 bbl. No. 2 Fameuse, at $2.00	2.00
Total revenue	$1,268.10
Total expenditure	722.98
Net profit for 3 acres	$545.12

Net profit per acre, $181.70, which on a valuation of $500.00 per acre, is a return of over 36 per cent.

In the balance of the orchard, which under Mr. Steeves' own direction was pruned, sprayed twice and a part of it sprayed a third time, but which was not cultivated nor fertilized, there were harvested 1,153 barrels, that is, from about 410 trees, most of the Winter Bough variety. The trees of this variety were very heavily laden and owing to the exceptionally early maturing and dropping of the fruit, picking was not commenced soon enough, and as a consequence nearly all the apples from this portion of the orchard were harvested off the ground and in a more or less damaged condition. Notwithstanding this, the run of these apples averaged $1.40 per barrel. The expenditure and receipts for the balance of the orchard containing 410 trees, was as follows:

EXPENDITURE—SPRING OPERATIONS.

Pruning 410 trees, at 6c	$24.60
Scraping 410 trees, at 3c	12.30
13 bbls. winter spray, at $1.54	20.02
20 bbls. summer spray, at $1.12	22.24
2 days, 2 men and 1 horse, hauling brush	9.00
Depreciation of spraying outfit	5.00
	$93.16
Interest at 6 per cent. on $2,500, value placed on the 5 acres by Mr. Steeves	150.00

HARVESTING EXPENDITURE.

1,153 bbls., at 30c	$345.90
Picking and packing at 20c	230.60
Hauling to station, at 8c	92.24
Total	$911.90

REVENUE.

1,153 bbls., at $1.40	$1,614.20
Total expenditure	911.90
Net profit on 5 acres	$702.30

Net profit per acre, $140.46, which on a valuation of $500.00 per acre, is a return of 28 per cent.

Had the apples not been injured by the heavy drop, they would probably have averaged 10 to 20 cents a barrel more. Though this portion of the orchard yielded $36.00 net profit less per acre than the other eight rows, yet the expenditure, apart from the cost of picking, packing, etc., and the interest charge, is only $18.63 per acre, as against $51.09, and the trees are not in as good shape as those on which the heavy expenditure was placed.

In this orchard the cover crops, which were sown mixed, made an exceptionally heavy growth, in most places fifteen inches high, and forming a dense, close matting which greatly lessened the injury to that part of the crop which fell.

(Continued on page 518.)

Cow Testing, the Indication of Real Dairying.

A Word to the Wise is Sufficient.

By Chas F. Whitley, Dairy Division.

What Cow Testing Is.

COW testing is a simple, inexpensive, reliable and interesting method of determining the real dairy power and ability of each cow in the herd, ability to convert feed into milk at a good profit.

The object of cow testing is to prove to the dairyman through keeping simple records which cows are paying and which are not, so that he may know which to beef and which to retain in building up a profitable herd.

A knowledge of the total production of the herd for a month, or even for the full season, is no guide to the information needed by the real dairyman as to the capacity of the individual cow. That only gives a knowledge of what is the average yield of the herd. An average, only, is likely to mislead, for records prove that one's judgment is apt to be considerably astray regarding some promising and deserving cows, while others exist only to deceive.

The following analysis of a typical herd indicates what differences exist between individual cows in the same herds in several localities.

ANALYSIS OF AN AVERAGE HERD

Average yield, 14 grades, 4269 Milk, 3.4 Test. 147.7 Fat.
Average yield, 7 Best Cows, 4878 Milk, 3.5 Test. 170.5 Fat.
Average yield 7 Poorest Cows, 3660 Milk, 3.3 Test. 125.3 Fat.
The Best Cows average 1218 lb. Milk, 44.8 Fat more than the Poorest.
The Total Earnings of 7 Best are $85.23 more than 7 Poorest.
The Total Earnings of Cow No. 1 are $20.70 more than Cow 13.
With Cost of Feed at $35.00 the Best Cows average $13.78 Profit each, Total $96.43.
With Cost of Feed at $35.00 the Poorest Cows average $1.60 Profit each, Total $11.20.
Cow No. 1 makes $19.60 Net Profit.
Cow No. 11 makes only $1.40 Net Profit.
Thus Cow No. 1 makes as much profit as 14 cows like No. 11.

Why should not each cow you own bring in a good $20.00 or $30.00 clear profit? Many cows do.

THE VALUE OF RECORDS.

A milk record to be of value to the average dairyman should be complete, for the full period of lactation; a partial record is very unsatisfactory, practically useless. Knowledge is wanted of the total production of each cow separately, and less than ten minutes a month spent in weighing and sampling will give definite information regarding a cow's actual yield of milk and fat. At a recent sale the cows with testing association records averaged $11 more than the others.

If the records cover a period of two or three years they are more valuable still. They show if each cow is producing 300 lbs. fat a year, and whether some individuals are yielding 1300 lbs. in 3 years. Then such a cow and her heifers are known to be valuable, either to keep or buy.

Farming has become a specialized business. The business man knows facts concerning his cost, production and profit, the dairyman cannot afford to guess. As he multiplies his output and his profit he cuts down the "overhead" expenses thus working more economically.

Dairy records constitute a valuable "first aid" to injured farmers whose dairy vigour has been dissipated in handling unprofitable cows. Your time is too valuable to waste on poor cows. Records mean less work on the farm, because your selected cows are labour saving machines. Cow testing is one link in the chain

At Pasture on a Dairy Farm Near Sussex.

of golden opportunities which increase with every clock tick.

Good cows make money, poor cows waste it; they also waste feed and stable room, time and temper. Get the dairy dollars now lost in handling poor cows, by selecting good cows. Make double your income and eight times the present profit inside four years, hewing out your fortune with good tools, your own well-tempered dairy ideas, and your good cows. Records post up the effect of storms, whether cold sleet, or hot temper. Lack of care and kindness is a fine of dollars and cents.

A record is an index to the type of animal kept and to the character of her keeper. The individual cow, in whom is being fashioned the dairy ideal of the enthusiastic farmer-artist, is worthy study. And the man is humanized, made the better man by contact with the embodiment of patient unselfishness exemplified in the exquisite types of your profitable cows.

Cow testing is the adjunct of rapid and rational herd improvement through intelligent feeding and wise breeding. Records indicate how much of what particular feed-stuff can be profitably given to a cow while they also designate from which cows the best stock can likely be raised.

CO-OPERATIVE BREEDING ASSOCIATIONS.

Records point out the advisability of making a district known for its particular breed, it is a reasonable and a paying proposition for both buyer and breeder when a locality is advertised as the home of many good specimens of one breed. Buyers don't want to travel miles and miles in picking up a carload, but they will flock to one spot to compete for good cows. Much room exists for this, as well as for co-operation amongst members of cow testing associations for procuring the best possible pure-bred sires of dairy breeds. This simple plan of immense natural benefit can easily be arranged by 15 or 20 members clubbing together for purchase and exchange, so that with three sires and herds divided in three groups a first class sire may be available for three periods of two years each. Co-operation aided in building our factory cheese and butter making, it may reasonably be extended to this community breeding, and is well "worth while;" for herds with the good sire will average an extra 2000 pounds of milk per cow, and the net cost of milk will be rapidly reduced as much as from 83 cents to 66 cents per 100 lbs.

A COW'S REAL VALUE.

The measure of a dairy cow's real value is the net profit she makes above the cost of feed. In dairying the unfailing law of retribution is in active operation. The liberal soul of the liberal feeder waxes fat, and his pocket book does not shrink and flatten if his cows have the opportunity of satisfying their dairy capacity on suitable feed.

Nowadays we must look for large profits from each cow. The old days, of a dual purpose cow producing only 3000 pounds of milk selling for $1.00 per hundred, on feed valued at $30.00, have gone forever, let us devoutly hope.

Large profits are not only desirable but easily obtained according to the experience of members of our cow testing associations. Men who credit each cow with her full production and debit her with the feed consumed

So, may I ask further, what does your milk or butter fat cost? You know its selling price, but as a wise manufacturer does your price book tell you at what rate per pound or per 100 each cow makes it? There lies the secret of success. The whole successful structure of dairying rests on this foundation stone of knowledge of individual performance. We find plenty of cows whose milk costs $1.25 and $1.35 per 100 lb., and whose butter fat costs 25 cents and 35 cents per pound, but no dairyman to-day can afford to keep that type with milk at present prices. Such cows can only be handled by our wealthiest men. Dairy records light the signal fires of intelligent action in selection of the type that will produce fat at 17 cents or less, and milk at 60 cents or less.

By this means we assure ourselves that there is satisfactory return for the investment of all the labour, day in and day out, bestowed on the cows kept. One moment, do you keep them, or do they keep you? Do you work for them or do they work for you? It is high time each factory patron distinctly understood the difference.

POSITIVE GAINS.

Those patrons who grasped this situation three or four years ago have every reason to be thankful. They write to me enthusiastically of the tremendous change in many ways that cow testing has brought. It has meant far more comfort in the home for the wife and children because of the largely increased income. It has meant a new interest in farm work, an appreciation of the dignity of labour, and of adequate payment for it. There has been a trading of every golden minute in the purse of time for improvement through wise dairy thinking of high ideals. Such men are not limited in their notions, they progress, becoming unlimited farmers, farming in their adventures in contentment with the plough of perennial admiration and inquisitiveness all that is best in the world of men and nature.

They harrow the lean hard places of the mind with the sharp tooth of progressive dairy thought. As practical men they in common with the factory owner, school teacher, merchant and banker have welcomed cow testing because it means no loss but positive gain. Note the large increase tabled in these six herds.

COW TESTING
In Account With the Average Farmer.

Debits	CREDITS Increases in Milk Yields Percentage 100 200		Average Yield Originally	Present Yield Per Cow Lb. Milk
NO LOSS AT ALL	Ontario	128 p.c.	3509	8000
	Quebec	191 p.c.	3800	7270
	Nova Scotia	278 p.c.	1459	5515
	N. Brunswick	170 p.c.	4608	7835
	P. E. Island	300 p.c.	1450	5800
	B. Columbia	100 p.c.	3090	6180

find that a rapid increase in the profit takes place as the dual purpose object is attained, the poor cows weeded out and the good cows further improved.

A business man looks for reasonable return on his investment. Do you make a good 5 per cent. or 8 per cent. on your capital sunk in land, buildings, horses, implements and cows? Is the profit being heaped up by each individual in the herd, or do two or three out of your twenty give you no return? You should be in a position to know definitely at your annual stock taking, for you are the one to benefit by any and every step in the direction of herd improvement.

Cow testing is intensely practical. Records show the futility of keeping ten cows to make as much profit as one should; they blazon the white way of endeavour, and crown with success the labours of the men who are wise enough to profit by what the records suggest. Cow testing is one of the best paying propositions ever placed before the dairy farmer.

May I emphasize the fact that the Dairy Division, Ottawa, is anxious to see this cow testing work taken up in real earnest by the farmers and dairymen in New Brunswick. The same generous offer as made during the last six years is open this year,

(Continued on page 520).

Conserve Soil Moisture for Heavy Crops.

Cultivate Early and Sow Early.

By W. M. Lea, Victoria, P. E. I.

WITHIN a very short time, we will again be working on the land; again given another start and another chance to correct any mistakes that may have been made in any past season. One of the gravest of which, I will venture to say, is failing to conserve all the moisture possible.

Now, we are all aware, be it a heavy, light or medium fall of rain, that the ground at some time always contains all the moisture it can hold. It is at some time so wet and soggy that teams cannot walk on it. We must then be watchful for the first day that it is dry enough to work without puddling and do something to mulch the land so as to prevent further evaporation. This is a most important operation and one that should never be neglected for any other work.

At this time the land is very firmly packed, and we must cultivate to break the connection. Our plan is, on fall plowed land, to go over everything that is red, with the spring tooth harrow. This loosens up a few inches of soil which dries in the sun and wind and makes a good mulch. It also helps to warm the land.

For grain we always, if possible, plow in the fall and prepare the seed bed with a harrow, not working too deep, as at whatever depth we break the connection the land, in a dry spell, will dry out, to that depth and if this is too deep for the roots of grain to reach the crop will suffer for lack of moisture which it cannot secure.

Grain should have a fine but not deep seed bed and as firm as possible. If we are forced to plow in the spring we don't plow too deep.

I consider an ideal cultivation for oats, is to plow to a good depth, consistent with the depth of the particular soil in question, in the fall, and leave it without harrowing. Then in the spring, as early as possible, work a fine seed bed with spring tooth harrow, thus scraping the soil without cutting deep makes a nice fine seed bed, with firm damp land not far below. On this sow with a disc drill, which sows the oats to an even depth in the moist soil.

Last season, although very unfavorable, we grew a "very heavy" crop over all our oat land. We always harrow with a light spike harrow just as the oats are about peeping through to again stir up the soil, work the land and renew the mulch. If we roll at all, we do so with a light roller on a dry soil, so as not to pack the surface. Cultivation to conserve soil moisture is a most important feature in the growing of our farm crops. This is one of the reasons why we grow as large an acreage of roots and corn as possible, for we can keep these crops cultivated, throughout the growing season, and they are much less subject, for this reason, to the season's fall of rain. After every rain, whenever the land is fit to work, we always start the cultivator. This gives us control of the moisture content, to a considerable degree, as was noticed last season, turnips and corn being the only crops in many sections of this Province that produced a full return. Early seeding is also most important and very often neglected. It is amazing to witness the liesurely manner in which some farmers go about their spring cultivation, and seeding. They seem to have great faith in Providence as they do little to help themselves.

Now we occasionally get seasons that have a regular rain fall, and these years, neither the difference in cultivation nor time of seeding seem to show such a variation and we often hear of experiments that are quoted from the experiences of these favorable seasons; but we should always make preparation against the most unfavorable conditions, and, if we are favored with plenty of moisture and a good growing year we will have certainly done nothing to injure our chances of a full crop. My advice is: cultivate early as possible, and while sowing always with the season, don't be late.

Cultivation checks the loss of water. The principle of water saving may be briefly stated as follows: After water is stored in the soil and the dry season comes, it rises from soil particle to soil particle, just as oil creeps up in the lamp wick. In the end, unless prevented by some obstacle, it reaches the surface of the soil, where it is evaporated and passes into the atmosphere as vapor. If you can stop it from reaching the surface, you can stop this evaporation. You have, no doubt, seen it stop many a time. For example, you have picked a board from the ground, or a stone, or leaves, or grass, or straw, and you have found wetness beneath these, no matter how dry the surrounding soil was. There was but one way by which this could happen. The moisture had come up toward the surface, and everywhere, except where one of these obstacles was, it had reached the surface and evaporated. But in the cases we have referred to, the stone, or board, or other matter, acted as a blanket and kept the water from reaching the surface. This principle is so well established that from it has been developed the practice of moisture saving by providing a layer of loose, dry soil or mulch, from 2 to 4 inches deep, at the surface, to serve as a blanket to prevent the moisture from reaching the surface and being lost by evaporation.

In order to keep this loose layer of soil, or so called soil mulch, the cultivator should be kept going quite frequently during the growing season. No regular rule, however, can be laid down. Whenever the surface mulch has become sufficiently compacted, so that the moisture rises up through it, then the cultivator must be started. After every rain storm it will be found that this mulch is compacted and there must not be a single day's delay in starting the cultivator. A farmer asked me, last August, how it was that his potatoes grew well until about the middle of August, when a heavy rainfall came, which he thought was just what was needed to push them along. But they did not do so well after this rainfall as during the preceding dry weather. I asked him if he had run a cultivator through his potatoes to break the crust formed by the rainfall. He replied no, and the explanation of the poor growth is very evident. Keep the cultivator going during the growing season.

A factor of great importance in the conservation of moisture is the control of weeds. Remember, when you see a weed growing on your farm, that every pound of dry matter in that weed has required 400 or more pounds of water to produce it. It will not take a very large weed to remove 200 pounds of water. At the Illinois Experiment Station two plots of ground, lying side by side, were prepared for corn in the usual manner, and planted. On one plot the weeds were allowed to grow, but on the other they were kept down by scraping with a sharp hoe without producing a mulch. The moisture content was determined during July and August, giving an average difference to a depth of 40 inches of 342,000 pounds per acre, which is a quarter enough to grow a crop of potatoes. When it is considered that in addition to their effect upon the moisture, weeds consume plant food that should nave been used by the main growing crop, we still further appreciate the importance of completely suppressing them.

By looking after the early cultivation of the soil and by frequent cultivating during the growing season to keep the soil well mulched until the crops shade the soil the moisture will be conserved and other things being equal the prospects will be bright for a bountiful harvest.

Don't be one of those who will be forced to say at the end of the season: "The harvest is past and my crops do not amount to much." "As a man soweth so shall he reap" is an adage that still holds true, but to it I would add another: "I passed by the fields of the slothful and him void of understanding and Lo they were overgrown with weeds." Don't belong to this class.

The Clydesdale Stallion, Baron Kelvin.

Baron Kelvin was imported from Scotland last August by Graham and Renfrew Co. of Bedford Park, Ontario, who recently sold him to John Richards, Bideford, P. E. I. Baron Kelvin is considered to be one of the best Clydesdales in America today and judging by his success in the prize ring and in breeding ranks the claim is justifiable. He was shown at the Toronto Industrial Exhibition where he won first prize in his class and championship over all ages. Later he competed in the state of New York, against all breeds and again won the championship. At the Winter Fair, Ottawa, last January, he met and defeated the very best stallions in Canada. He sold at perhaps the highest price ever paid for a stallion in Canada, which shows that the breeders of P. E. Island are out for the right kind of stuff.

Corn That Will Grow.

Ensilage growers should plant corn that will grow. W. E. J. Edwards, Secretary of the Ontario Corn Growers' Association, Essex, Ontario, has published a circular containing the names and addresses of members of his Association who have seed corn for sale. A copy will be sent to readers of the Maritime Farmer on request.

How I Built My Concrete Piggery.

A Serviceable, Substantial Structure.

By F. C. Beaton, East Point, P. E. I.

THE dimensions of this building are length, 70 feet; width, 18 feet; post, 7 feet, three feet being concrete. Cellar in one end of building 18 x 15 feet, 6½ feet deep, walled on all four sides with concrete; floored throughout with concrete; foundation of concrete three feet under ground.

Excavation for cellar was done with slip scraper and team. Trench for foundation was dug 10 inches wide, allowing two inch batter. Forms for cellar walls were constructed thus: Four pieces of scantling, long enough to reach across cellar and rest on ground, were set on blocks, in parallelogram size of cellar, less uprights and form boards, and securely nailed together and fastened to blocks; uprights (2 x 4) were stood against outside of parallelogram and tacked to hold in position. Foot of uprights were secured by "liners" pieces of scantling placed behind uprights, and held in position by stakes driven in ground. Boards used were ordinary ⅞ inch rough boards, fastened to uprights with 6 dy. nails, soft soap being used to tighten seams.

Foundation for floor was prepared by pounding gravel dug from cellar into ground, grades for drainage etc. were got by using spirit level and straight-edge; pegs were driven in foundation at points required to mark grades. Work was begun on cellar walls, concrete mixture being shoveled into chute leading to bottom of cellar, for first three feet of wall, after which it was dumped into forms from wheel-barrows. When cellar walls were up to height of bottom of foundation, filling was continued all around building. Cellar walls and foundation were brought to floor level, then floor was laid in 10 feet sections, every alternate section being done; four inch strips were laid every ten feet across floor of pens. First ten-foot section was laid, levelling being done by sliding straight-edge on four inch, between, which was next done, levelling being done in this case from floor on either side; this was continued until floor of pens was finished, after which feed-way floor was laid. Gutter was made by embedding in soft concrete two boards nailed together to form right angle, one edge of board being allowed to rest on edge of completed pen floors.

Erecting a Concrete Piggery.

The above cut shows the piggery erected by Mr. F. C. Beaton, East Point, P. E. I., one of the prize winners in the Canada Cement Co's competition for the best concrete work. The Company's ad. appears on another page of this issue.

Then wall forms were erected, uprights held in place by "liners," liners for outside forms being held in place by stakes driven in ground, and inside by 2 x 4 stretched across floor.

Concrete mixture was dumped into forms from wheel-barrows, for which temporary staging was built; walls 8 inches thick, stone fillers used in all walls. Concrete mixed one part concrete, two sand, and five gravel. Six inch bolts were set in soft concrete to hold sills in place. Concrete was mixed by hand on 10 x 12 mixing box, one barrel of cement being mixed at a time. No skilled workmen were employed, we built the forms ourselves, and the only men employed were labourers to assist in mixing and placing concrete. We had no previous experience at concrete work, yet the job has been pronounced O. K. by competent judges.

Door frames were set inside forms before concrete was placed. All lumber used in forms will be used in structure later, so there was no expense for forms except nails and work. Gravel and sand were hauled from sea-shore on farm at odd times.

The cost of the job is as follows:—

54 barrels of cement $2.30 per barrel	$124.20
Hauling gravel, man and team 6 days (from seashore on Farm)	15.00
Hauling sand, man and team, 2 days	5.00
Hauling stone fillers, man and team, 3 days	7.50
Excavating for cellar (root) 2 men, team, scraper, 3 days,	10.50
Digging trench for foundation 10 inches at bottom, 8 inches at top, 3 feet deep, 2 men, 1 day	2.00
Preparing foundation for concrete floor, 2 men, 3 days	6.00
Erecting forms, 2 men, 3 days	10.00
Mixing and placing concrete, 5 men, 7 days	35.00
Tearing down forms, 2 men, 1 day	2.00
30 lbs. nails used in forms	.80
Hauling water for mixing concrete	2.00
TOTAL	$220.00

Nearly all the work described here was done by ourselves (brother and self) only 3 men being employed 7 days, mixing and placing concrete. I have charged local prices for men and horses in this statement. No charge is made for lumber used in forms, as practically none was destroyed, and it will be all used in the building.

To Concrete a Cellar Floor on Wet Land.

How the Difficulties Were Overcome.

By T. W. Keillor, Amherst Point, N. S.

THE first thing is to dig the cellar 6 inches deeper than you want the floor, with a crown of two inches through the center and sloping from three to four inches, according to size of house, toward the drain, which should be three inches below the lowest part of cellar.

Lay a board six inches from the wall starting at the drain, take a mud pick and make a trench along the edge of the board next to the wall about three quarters of an inch deep, move the board along until you have the trench all around the outer wall, back to the drain. Clean off the loose earth you have made in digging the trench and place two inch tiles in this trench, which you will find just deep enough to hold the tile in place.

Break stone quite fine all over the floor, gravel will do by pounding down with a heavy maul, but it is hard to get the gravel as firm as the stone, to a depth of three inches, being careful not to pound directly over the tiles as it will be likely to break them.

Take a piece of wood about ten feet long, one and a half inches thick and from two to four inches wide for a guide board, place the guide board on the coble stone, or gravel, about two and a half feet from the wall. Take two thin boards about one inch longer than will reach from the ceiling down to the one and a half inch guide board, place one on each end of the one and a half inch guide board and spring them in just tight enough to hold the guide board in place. If the guide board is resting on some stones or gravel that happens to be higher than the general run, tap gently on the guide board directly over the high point, this will bring it down to the even level of the stone or gravel.

Interior of Stable Owned by Robt. Malcolm, Brule, N. S.

A prize winner for best concrete work done, as shown by photograph in the recent competition carried on by the Canada Cement Co., whose ad. appears on another page of this issue.

Now we are ready for the concrete. Make a mixing board, about ten feet square, of one inch boards with cleats nailed on the under side, about three feet apart, to keep it firm.

For a measuring box a large confectionery pail which holds about four gallons, can be used on a small job. Fill the pail seven times with bank run gravel and empty it on the mixing board spread it out to a thickness of about four inches. Now fill the pail once with Canada Cement and spread it over the gravel. Take your square mouthed shovel and shovel the mixture over four times on the board. This will mix it ready for water. Take a pail to measure the water in, but don't put too much in at first. Shovel the pile over until the water is well through it, then add more water until the concrete is a little crawley. It is now ready to put on the floor. Spread it in the space between the guide board and the wall, being careful not to have it thicker next to the wall than it is at the guide board, and pound it down with a tamper or hammer made of a stick of wood 8 x 8 x 18 inches, with a hole bored in the end and a shovel handle driven in it to lift it by. As you get the space filled between the guide board and wall level with the top of guide board, slip out the spring boards which hold the guide board down and move it along until you have finished a strip along one wall. Now move your guide

(Continued on page 530).

Beef Production in New Brunswick.

Revive the Waning Though Profitable Industry.

By Ashley George, Upper Sackville, N. B.

AT the recent Live Stock Convention held at Ottawa, the beef industry of Canada was a question of lively importance. One man is reported continued, Canada will in a few years be importing beef for her own consumption." This statement is perfectly justifiable when we learn that beef exports from Canada to Great Britain have decreased during the last six years from 149,000 head to 42,000 head.

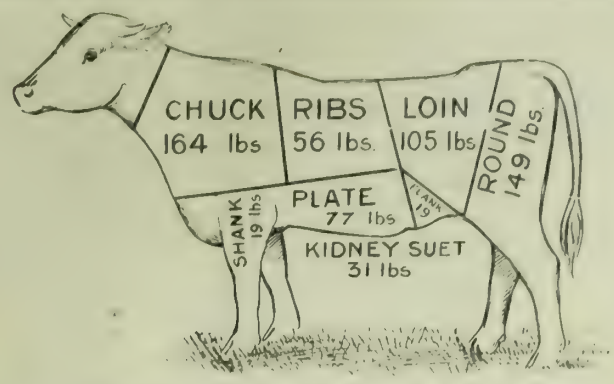
In the Prairie Provinces, where ranching has been predominant, the homesteader is taking the place of the rancher and domestic beef raising, while but in its infancy, is one of the growing industries of that country, and the fact that the railways are totally unable to handle the immense output of grain crop, entailing a loss last year to the grain growers of from 20 to 25 millions of dollars, will stimulate a greater degree of mixed farming of which the beef industry will be one of the principals.

Going back in the history of the beef industry some 15 or 20 years, it was an almost every day occurrence to see a carload of beef cattle leaving our country stations for the market centres of our Province, or across the ocean to Great Britain. I have seen on our own farm, and this instance was only one of the average in our section, some 12 or 15 cows of the old-fashioned grade Shorthorn type, varying in weight from 1200 to 1400 lbs., cows with an almost unlimited stomach capacity, with high udders and teats proportionately large that would in the flush season give from 50 to 60 lbs. of milk of fair test per day. The offspring from this stock were of a hardy growth by nature and when at the age of three or four years, would be fatted and shipped off for beef. This was the time when New Brunswick flourished as a beef producing Province.

At the same time domestic dairying was also a large source of the farmer's income. But not satisfied with that condition of things, the Government undertook to boost the dairying industry by introducing bulls of the special dairy breeds. Travelling dairies with experts were sent over the Province. Fairy tales were told of wonderful records by some Jersey or Holstein cow and government bonused creameries were established in many districts. Then began a distinct retrogression of our large, hardy, old-fashioned grade Shorthorns, which place up to recent years has been taken by the scrub Jersey or Ayrshire grade steer.

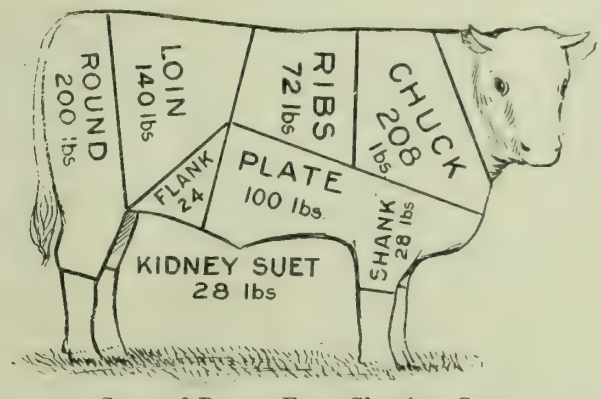
The progress of a farming community is largely judged by the quality of stock kept by its farmers, and the presence of superior animals inspires greater activity and advancement in that particular line.

The Government has, by sending expert judges and professional speakers about our country fairs, sought to improve our conditions. For years past we have attended our Provincial and Winter Fairs. We have seen the best this country can produce. We have been told what has been and what can be accomplished. We return home with a feeling of disgust with the stuff that is around us. Our stock breeders have imported bulls and heifers as near as possible in type to the ideals set by these government experts. We seek to better our stock through these means and after successive years of high breeding we find our stock improved but very much less in number. For this fact, there must be some reason. We know that to make beef raising profitable, dairying must be associated with it, but in the improved stock of which I speak we have a cow that will barely feed her calf and that is altogether unprofitable. We have a calf which when nursed and fed until 2 or 2½ years old, will weigh from 1200 to 1400 lbs. but one which will cost much more than he is worth.



Unprofitable Steer, The Kind Not To Feed.

This steer weighed 1100 pounds alive and 600 dressed. His dressing percentage was 56 p c. His low back, high flank, narrow head and narrow back are all undesirable in a beef steer.



Steer of Proper Form Showing Cuts.

This steer weighed 1300 pounds alive and 800 pounds dressed. This makes his dressing percentage 60. He is an example of the most profitable steer to feed. Note the broad head, straight, level back and deep flank.

Thus it is that this class of cattle can be raised only by the wealthy classes for show purposes and cannot be indulged in with any profit by the farmer of ordinary means.

The Governments of our country have at last awakened to the conditions they have thus created and a strong effort to improve agriculture in this line is being most seriously considered.

During the fattening period of an animal's life, it does not always get proper attention. The stable may lack light and ventilation. The animal may be infected with scab or lice. Warbles are allowed to mature. All these things have a detrimental effect to the profit side of that animal.

Just here regarding the warble;—Naturalists tell us that the only means by which the warble or gad-fly is propagated is through the cattle. If this be true, it would be possible in a very few years to completely exterminate them. The presence of the gad-fly in the summertime is a source of great annoyance and discontent to the animal and must necessarily decrease its beef product. During the periodic stage of the warbles development, the animal must suffer considerable loss and when a beef animal is badly infected, the value of the beef as well as that of the hide is much depreciated. If the farmers owning cattle were compelled to destroy these warbles, it would mean only a few years before they would be completely exterminated.

It is true that the producing end of a steer is of vast importance, but it is also true that the market end is just as important.

When a farmer has finished an animal ready for the block, he looks back over its history. He thinks of it when it was a calf, when for five or six weeks it was fed the rich whole milk, then nursed along through its first winter with turnips and oats, how during the next year and a half it is turned to roughish pasture and fed with rough hay, and perhaps a little roots, then put up in the fall of the second year and fed on the best hay and an ever increasing ration of turnips and meal until finished in the spring of the third year. He realizes that the steer is an absolute necessity for the upkeep of the farm. He thinks of the value of the stuff that has been fed, of the labor that has been expended and feels that an average price of say, 4½ cents per lb. is poor compensation for all his trouble. He holds for a possible raise to 5¼ or 5½ cents. For a time prices remain steady, but soon we find agents of the big Quebec and Ontario meat packers have contracted to supply our markets during the summer for a less price than the foregoing. Thus it is that the beef producers of this Province are somewhat handicapped.

We go to the retail dealer. We find him selling the best cuts for from 16 to 20 cents per lb., when he paid but 10 cents per lb. for the carcass. We ask him why so much difference? He tells us that many of the citizens are very exacting. The cost of delivering so many small lots all over the town at a certain hour of the day is very expensive. The upkeep of slaughter houses, the hiring of expensive labor out of the shop all tend to increase the price of meats to the consumer. It is generally acknowledged that there is too much difference in the price of produce as to when it leaves the farm and when it reaches the consumer. If we could have established Government owned abatoirs with modern cold storage facilities centrally located and with cheap transportation rates both ways, it would tend very largely to eliminate the congested conditions which sometimes prevail and at the same time stimulate to a greater degree the beef production of this province.

One of the best assets of this country was lost to the farmers when our County Councils established pound districts throughout our parishes. Every summer large herds of cattle roamed throughout our wilderness lands where abundance of pasturage was afforded them. We cannot blame those farmers living in the back districts, whose crops were often destroyed by straying cattle, asking for protection, but at the same time it is possible by some legislation to reinstate to the farmers those valuable grazing areas which are now merely the home of the moose and the deer.

Fortunately for the farmer he has the choice of raising beef under these conditions or turning his attentions to field crops and fruit culture.

With the scarcity and high price of labor, it is found necessary to supplement the full cattle barns and large manure heaps by a more modern and comprehensive means of soil fertilization. Science is playing a most important part in the history of agriculture and demands of the agriculturalist, a study which is second to that of no other profession. The use of chemical fertilizers, the growing of clovers and other fertilizing plants, the so-called rotation of crops with its more frequent cultivation of the land, the use of so much modern machinery and other labor saving devices, the prevailing high prices of field crops, small fruits and garden truck are proving themselves more attractive to the student farmer and directing his attentions from the more strenuous and less profitable work of beef raising.

Our Federal Government is appropriating a large amount of money for the direct benefit of the farmers of Canada, and New Brunswick getting its proportionate amount together with the money granted by its own Government, it is hoped that some material benefit to the beef industry as well as to all other branches of farming will result from an honest, wise and careful distribution of these appropriations.

Busy White Orpingtons.

C. Perry Foote, Kentville, N. S., writes:—

Enclosed find ad. copy and cash, $1.10, for 2 insertions in your want column. I have a very fine lot of hens this season and can supply eggs good enough for anybody. I am very much pleased with the White Orpington breed. Last season I had fifteen hens and from the first of April until August we bought eggs to use, as local breeders kept ours bought out all the time, for hatching purposes. From appearances the 21 I have this year will be kept just as busy.

The Third Annual Maritime Horse Show.

Noticeable Improvements in Every Class.

THE third annual Maritime Horse Show under the auspices of the Maritime Stock Breeders' Association was held at Amherst, N. S., on April 3rd, 4th and 5th.

Despite the fact that the weather man did not furnish weather that was all together pleasant, the total gate receipts at the close of the show told the story that the attendance had been larger than at any of the preceding shows.

QUANTITY AND QUALITY.

And the visitors who patronized the show were not disappointed in the number and quality of the exhibits nor in the manner in which they were exhibited and judged. There were over two hundred horses totalling three hundred and eighty-five entries exhibited this year while last year the number of horses exhibited was one hundred and thirty, totalling two hundred and thirty entries.

The quality of the horses shown in the various classes was a great improvement on that of the horses shown in 1911 and in 1910. The judges, who have visited and judged at some of the largest shows on the American Continent, said that in the Clydesdale, Heavy Draught, Agricultural, and in some of the lighter classes they had never seen better exhibits. There was no room for culls or unfitted horses and in many classes after the prize winners were picked out there were enough good horses left, without the money's pale, to make a good showing at some of the larger fairs. It is said that "Competition is the life of trade." We also believe that the friendly rivalry between the various breeders at the Maritime Horse Show will be the means of embuing the horse breeding interests with new life, and as they progress in the work by importing and breeding better stock, their influence will be far reaching.

THE HORSE VS. THE AUTOMOBILE.

With the advent of the automobile a few years ago it was said that the horses' death knell had been sounded and that ere long man's noblest and truest friend would be relegated as a thing of the past. Well we have had the autos for many years but still horses are more popular and in more demand than ever before. An Automobile Show was held in Amherst on the second floor of the Winter Fair Building, concurrently with the Horse Show, but a visitor to both shows could judge by the number of sight seers who patronized the shows that the centre of attraction was around the horse judging ring. The magnificent sturdy draughters, the speedy roadsters, the trappy carriage horses and the prancing saddlers, presented an animated scene from which even the toot of the automobile could not detract the attention of the public.

THE MANAGEMENT.

Col. H. Montgomery-Campbell, president of the Maritime Stock Breeders' Association, Mr. Fuller, the efficient secretary-manager, and the various officers who so did their respective duties so nobly and well deserve a great deal of credit for the success of the fair and the frictionless manner in which they conducted every detail that tended to make an appreciative audience and satisfied showmen.

THE JUDGES.

The Heavy horses were judged by Mr. John Bright, ex-president of the Canadian Clydesdale Breeders' Association, Myrtle, Ontario; the Light horses were judged by Mr, Sheldon B. Fuller, Ottawa. Not a dissenting opinion was heard in regard to the Heavy horse judging as the audience could easily follow Mr. Bright's deductions. On the whole the Light horse judging was also acceptable, but there were some cases where some of the onlookers would not consider a reverse judgment a very grave mistake. We have no doubt, however, but Mr. Fuller, the judge, considered conditions as he found them and adhered closely to the rules set down for judging the respective classes, thus doing his work in a conscientious manner.

May Lothian.

Winner of the Douglas & Co. Silver Cup for the best Clydesdale Mare. any age, at the recent Maritime Horse Show, Amherst, N. S.
Owned and Exhibited by R. A. Snowball, Chatham, N. B.

THOROUGHBREDS.

In the Thoroughbred class, G. W. Fowler's aged stallion, Waterlight had R. W. Carson's Bendemier for a competitor but the red ribbon and championship diploma went to Waterlight, by the famous Watercress and the possessor of a running record of one mile in 1 min. 39 sec. and purse winnings of over $63,000 to his credit. It will be remembered that Waterlight was champion Thoroughbred stallion in 1911.

H. R. McMonagle's Lindahorn, a very trim, three-year-old filly, was the only female representative of her breed.

STANDARD BREDS.

were out in strong numbers. The aged stallion class which was judged on the Amherst Streets, brought out five good ones—Rudy Kip, owned by A. E. Trites, Salisbury, N. B.; Royal Night, owned by C. R. H. Starr & Son, Port Williams, N. S.; Right Wilkes, owned by Geo. M. Holmes, Amherst, N. S.; Baron Duncan, owned by W. S. Teed, Sackville, N. B. and Royal Autograph, owned by M. A. Latta, River Herbert, N. S. The Red, Blue, White and Green went to the horses in the order named. Rudy Kip is a very nice even gaited horse with a track record of one mile in 2 min. 4 sec. Royal Night has size, style and speed. He is eight years old, sound, weighs 1200 pounds and is full of substance. Right Wilkes is a very attractive horse and puts up a very classy appearance. Baron Duncan and Royal Autograph were out in good form.

Tunbrook, owned by G. M. Holmes, and Rush Lake, owned by Everill Purdy, Amherst, were the only entries in the three-year-old stallion class and were placed same as last year in the order named.

Standard Bred mares made a grand showing in the aged class. Grace Abbott, owned by A. E. Trites, second prize winner last year, was successful in capturing the coveted red and championship diploma from Luella Mac, her successful rival last year, owned by J. T. Prescott, Sussex, N. B. Luella Mac captured the blue ribbon, while H. R. McMonagle's McMary came in for third money and the fourth went to Minerva Vernon, owned by W. T. Latta, River Herbert, N. S. Everill Purdy's Jennie Wilkes was not hitched and H. R. McMonagle's Inherites, a very large filly, not being accustomed to so much excitement, would not steady down to show action.

Harvest Hal by Will be Sure, owned by A. E. Trites, Kitty McNeil by Achille, owned by G. S. Jackson, New Glasgow, N. S., Jennie Lin by Judge Wilkes, owned by H. R. McMonagle and Lady Buz Fuz by Buz Fuz, owned by Cecil T. Coates, Nappan, N. S. pulled into the ring for three-year-old fillies and were placed in the order named.

Miss Sure and Nellie Be Sure, owned by G. M. Holmes and Ettar & Lowe, Amherst, N. S., were the first and second prize winners respectively in the two-year-old filly section—same position as last year.

HACKNEYS.

R. A. Snowball's unbeaten Model Performer, in the aged stallion class, was successful in maintaining his prestidge. Seaforth Enterprise, owned by McFarlane Bros., Fox Harbor, N. S. was a strong competitor in this class and was successful in capturing the red ribbon in the Carriage stallion in harness class. Sedgeforth Enterprise was imported by the Nova Scotia Government as a two-year-old and sold for service in the province. His breeding traces back to several of the best sires in the Hackney breed. His get are proving his value as a sire. We understand he will stand for service in Amherst this year.

Snowball's Cock 'O the North had no competitor in the three-year-old stallion class but he was good enough to sweep everything before him in the champion Hackney stallion class.

Rev. R. T. Hawkes, Bartibog, N. B. showed Signal, the only two-year-old Hackney stallion in the ring. He too would stand competition.

W. W. Black's Violet and Dignity came in for first and third honors in the aged Hackney mares' class. Mrs. H. E. Fawcett's Lucille captured the fourth award and also the silver cup donated by Terrace Hotel, Amherst, for Champion Carriage Horse in harness. Wm. M. Johnson, Newcastle, N. B. captured the second prize with Ardimersay May Queen, a beautiful, trappy, imported mare. We understand this mare is for sale and the person who buys her will get a horse of which he may well feel proud. R. A. Snowball's Langton Belle had ne competition in the three year old filly class, but was successful in capturing the diploma for best Hackney mare, any age.

Chatham Lily another Snowball mare had no competition in the two year old class.

CLYDESDALES.

Magnificent indeed were the eight specimens of the Clydesdale breed that appeared in the ring at the director's call for aged stallions. C. H. Starr & Son's Baron Primrose, the champion of the 1910 show and the sire of the 1911 champion, a champion at Toronto and Chicago in his younger days, and also a champion at Maritime Fairs on many occasions, although in his eleventh year, again captured the coveted diploma, and silver cup donated by Graham Bros. for best Clydesdale stallion, any age. This cup was won in 1910 by Baron Primrose, in 1911 by his son, Baron Graham and now it becomes the property of Messrs. Starr. Baron Primrose has size and quality combined and his get are showing up as successful winners in the show-ring. Judge Bright says Baron Primrose is a far better horse to-day than he was when he won the championship at Toronto some years ago. McFarlane Bros.' Baron Squire, sire Baron's Pride, dam by McGregor, was the closest competitor for the silver cup and the winner of second money in his class. Baron Squire is of right royal breeding and is considered by competent judges to be one of the best Clydes in Eastern Canada and should prove a valuable acquisition to horse breeding interests in Cumberland County. McFarlane Bros. are only beginners in the show business and they deserve a great deal of credit and patronage for their energy and progressiveness.

R. A. Snowball's Baron Belgraddon by Baron Primrose, the champion stallion, another typical Clyde came in for third money, while Fred S. Black's Flash Favorite 2nd came in for the fourth award. Other good horses without the money's pale were: Royal Baron's Pride, The Bishop, Vanderbilt and Petruchois Heir owned by H. R. McMonagle, Geo. M. Holmes, McFarlane Bros., and H. Purdy & Son.

The three-year-old stallion class was represented by six good ones. Snowball's massive Chatham Fame by Scottish Fame mounted to the head of the list, followed closely in second place by Starr's Baron Prince by Baron Primrose, which although

not a little lacking in weight possesses excellent quality in foot and limb.

Frank Dobson's Billy Dalkeith by Baron Dalkeith stood in for third money, and the fourth prize went to Ronald Rutherford's Royal Flash, a College bred horse by Flash Favorite. A. H. Clark's Favorite Prince, by Flash Favorite, and McFarlane Bros.' Vanderbilt colt were further down the list and beyond the range of the prize money.

Tom Brown, Geo. E. Fisher's two-year-old stallion by Kilmarnock, had no competition in his class.

Eight magnificent mares were shown in the aged class by Messrs. R. A. Snowball, Logan Bros., Stuart Etter and W. W. Black. Snowball's May Lothian, Logan's Pink Rose by Up-to-Time, a song of Baron's Pride and her daughter Baron's Fancy toed the mark for first, second and third prizes respectively. May Lothian captured the Douglas & Co. silver cup for best mare, any age. One of W. W. Black's mares captured the fourth prize, while Stuart Etter's Adela was put in fifth place. This class did not show as many evidences of 1912 foals as did the same class in 1911.

Starr's Lady Primrose, by Baron Primrose, a full sister to Baron Graham, the champion Clyde stallion in 1911 captured the red ribbon in the three-year-old mare class and the diploma for best Clydesdale mare, any age, the silver cup going to her rival, May Lothian in the championship class owing to the ruling that no exhibitor may not win more than one cup. Purdy's Kate Allen captured the blue ribbon and R. S. Stiles' Rose of Homestead and Etter's Daisy Pride captured the white and the green respectively. Another mare shown in this class was Jessie Favorite owned by Stuart Etter.

Snowball's Moss Rose by Baron Belgraddon, dam Rosie Miller lead the two-year-old mares' class. A. H. Clark's Talbot Queen was in second place and Logan's Soubrette of Homestead by Handy Andy, dam Soubrette, stood in for third money. Soubrette Homestead is a good mover and possesses abundance of quality but was not in high show fit. W. W. Black and Snowball had other entries in this class.

In the yearling filly class, H. S. Pipes & Son's Princess Nora was sandwiched in between Snowball's Miss Mary and Lady Rose.

The Clydesdale Horse Association of Canada's special prizes were awarded in the order in which the winnings were made in the regular sections of the Clydesdale class.

PERCHERONS.

Chas. Symes' Lord Roberts shown in the three-year-old stallion class, his aged mare, Distinguee and his one-year-old filly, Distinguee II had no competition in their respective classes and were the only Percherons at the show.

ROADSTERS.

In the Roadster aged stallion, in harness, class there were five entries and the awards were placed as in the corresponding Standard Bred stallion class.

Eleven horses pulled into the ring for the awards in the class for mares or geldings, 15-2 hands and over, foaled previous to January 1st, 1909, and were placed as follows: 1st, Maud E. owned by A. E. Trites, Salisbury, N. B.; 2nd, Susie Wilkes, owned by J. C. Purdy, Amherst, N. S.; 3rd, Lady Border, owned by J. T. Chapman, Amherst, N. S.; 4th, Bonnie Prince, owned by F. M. Blenkhorn, Nappan, N. S. and 5th, Leulla Mac, J. T. Prescott's second prize winner in the Standard Bred class.

The class for Roadster mares or fillies, under 15-2 hands, foaled previous to January 1st, 1909 was graced by fifteen entries. The trappy mover, Brilliant by Brazilian owned by Alder Elderkin, Amherst carried off the red ribbon, and the St. Regis Hotel silver cup for the best Roadster, in harness. Grace Abbottt, the champion Standard Bred mare went down to second place and was followed in third and fourth places by J. C. Purdy's Gypsey and G. S. Jackson's Monachille by Achille.

At the toot of the horn, eleven horses appeared for their awards in the Roadster mare or gelding, foaled during the year 1909. Merril C. McLean's Prince by Sidney McGregor led the way followed in second place by A. E. Trite's Harvest Hal by Will Be Sure. G. S. Jackson's Kitty McNeill by Achille came in for third money and the fourth place went to G. W. Fowler's Judge by Judge Wilkes.

Two-year-old Roadster fillies were shown by Geo. W. Fowler, Geo. M. Holmes, H. S. Pipes & Son and Etter & Lowe and won out in the order named with Harry, Miss Sure, Gyp. and Nellie Be Sure.

In the yearling Roadster class, G. W. Fowler's Toney by Buz Fuz; and Rudy Kip colts shown by Sutton Steeves and Allie Steeves carried off the principal awards in the order named. An Oakley Baron and a Will Be Sure colt stood outside the range of the cash.

Pairs of Matched Roadsters numbered five. Grace Abbott and Maud E., the first prize Standard Bred mare and the first prize aged single Roadster, 15-2 hands and over, captured the first prize in this class. Elderkin's Brazil and Brilliant both by Brazilian, captured the blue ribbon, while J. C. Purdy's Susie Wilkes and Gypsey, prize winners in their respective classes won the white ribbon and Blenkhorn's Bonnie Prince and Sim took the green.

The other pair shown in this class was C. H. Jackson's Beauty and Lady by Parkide, Jr.

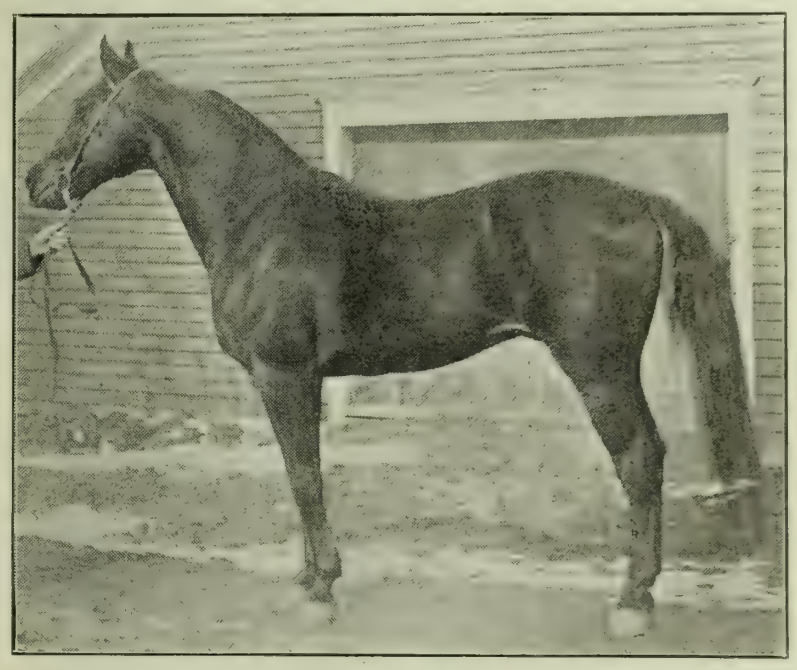
CARRIAGE HORSES.

There were five entries in the Carriage stallion, in harness, class three of which were ruled out, leaving the contest between the first and second prize Hackney stallions, Model Performer and Sedgeforth Enterprise. Thomas Hooper, the efficient horseman at the College Farm, Truro, was invited by McFarlane Bros. to handle their Sedgeforth Enterprise and by his skilful handling of the ribbons, displayed excellent horsemanship and so livened up his horse to carriage action, that the judge was compelled to reverse his judgment in a previous class and put Model Perfotmer down to second place. We have no hesitation in saying that had Mr. vious class and put Model Performer, the decision would have been the same as in the Hackney class providing Performer responded as readily to good reinmanship as did Enterprise.

There were only sixteen entries in the class for Carriage horses in harness, over 15-2 hands, foaled previous to January 1st, 1909.

Gammon & Weir, of New Glasgow had the winner of the red ribbon. F. M. Blenkhorn's Bonnie Prince by Sim, I. I. Peel's Billy, Mrs. H. E. Fawcett's Lucille, the winner of the Terrace Hotel cup, for the champion horse in harness and Etter & Lowe's St. Elmo stood in second, third and fourth places respectively.

In the class for Carriage horses, under 15-2 hands, in harness, Mr. Elderkin's Brilliant the first prize winner in the corresponding section of the Roadster class again mounted to the front in a class of nine entries. W. M. Johnson's Ardmersay May Queen stepped up to second place closely followed in third and fourth places by W. W. Black's Violet and Dignity and in fifth place by G. A. Doncaster's Dolly.



Rudy Kip

Champion Standard Bred Stallion at the 1912 Maritime Horse Show. Record 2.04.

Snowball's Langton Lily, McMonagle's Jennie Lin and E. I. Peel's Minnie C. made up the three-year-old Carriage horse, in harness, class and won in the mentioned order.

Black's Violet and Dignity and Blenkhorn's Bonnie Prince and Sim captured the red and blue respectively in the Matched Carriage pair class.

SADDLE HORSES.

Saddle horses ridden by gentlemen were shown by A. H. Clark, Durham, N. S.; J.C. Purdy, Amherst, N. S.: W. M. Johnson, Newcastle, N. B.; C. B. Embree, Amherst, N. S. and Capt. F. B. Eaton, Halifax, N. S. and were awarded prizes in their respective order.

Miss Blanchard, Kentville, N. S., showed Queen Louise and won first monies in the Saddle horse and Leaper horse, ridden by a lady, classes. H. C. Purdy's Gypsey came in for the second plum. C. B. Embree's Rifle captured the third award and H. E. Fawcett's Jack took the fourth and last prize.

Embree's Rifle touched the high spots in the section for Leaper, ridden by gentleman, Queen Louise ridden by Thomas Hooper leaped to the second highest point, while Capt. Eaton's Phryre not touching so high a notch, had to take the third prize.

CARRIAGE HORSES.

In the section for Carriage horses over 15-2 hands, where appointments counted 25 p. c. and the horse 75 p. c. Mrs. Fawcett's Lucille captured the fattest plum, Spurgeon Gammon's trappy horse came next in the list of awards, Fowler Bros.' Bobby and Geo. M. Holmes' Rex captured the third and fourth prizes. Three good horses remained after the monies were apportioned.

In the corresponding section, under 15-2 hands, Elderkin's Brilliant again pranced to the front. W. W. Black's Violet and Dignity were in third and fifth places, while Snowball's Langton Belle and Doncaster's Dolly captured the second and fourth prizes respectively.

W. W. Black's Violet and Dignity met no competition in the section for pair Carriage horses in harness. They also won first money in the Tandem section. Elderkin's Brazil and Brilliant standing in second place and Geo. M. Holmes tandem taking the third and last prize in the list.

E. B. Elderkin and W. W. Black were the only contestants in the Carriage Four-in-hand class. They both made extremely creditable displays and were awarded prizes in the order named.

The silver cup donated by Col. H. Montgomery-Campbell for the best combination saddle and carriage horse was won by J. C. Purdy's Gypsey.

PURE-BRED HEAVY DRAUGHTERS

Every horse shown in this class belonged to the Clydesdale breed. The prize winners in the section for mares or geldings foaled previous to January 1st, 1909 were the same as the winners in the corresponding section of the Clydesdale class.

The three-year-old mare class had three entries and prizes were awarded to S. M. Stiles' Rose of Homestead and Stuart Etter's Jessie Favorite and Daisy Pride. Etter had the only team in the class for heavy draughters foaled during the year 1909 but in the class for teams foaled previous to January 1st, 1909 there were four entries, Logan's Pink Rose and Baron's Fancy and his Princess May and Polly McGregor quickly mounted to first and second positions followed in third place by Etter's Adela and Titama.

Etter and Logan entered the contest for the Arthur Wallace cup for best heavy draughter Four-in-hand. The coveted silver cup was captured by the Logan four. The judge said he had never seen a better combination Molly McGregor and Princess May made a great wheel team being perfectly matched and weighing 3400 pounds. Pink Rose and her daughter Baron's Fancy made excellent leaders. Baron's Fancy is developing to be the perfect image of her dam.

GRADE HEAVY DRAUGHTERS.

Fowler Bros. led the way in the aged class with Minnie by Prince of Arwick and came in for third money with Major, also by Prince of Arwick. J. R. Lamey's Jim and Forrest Bros. Nance respectively captured the second and third monies.

W. P. Keilor had the first prize winner in the four-year-old section of this class and was closely followed in second and third places by Forrest Bros.

R. A. Snowball's Mart and King were followed in third place by T. W. Keilor's Sul in the three-year-old class.

Fowler Bros.' Minnie and Major made up the best aged team. R. P. P. Fraser, New Glasgow, N. S. won the second highest award with a well matched Ontario bred team and Edgar Fillmore, Amherst, N. S. captured the third prize with his trappy team, Mike and Barney.

The silver cup donated by the Am-
